Washington, D. C.: Bureau of Mines : United States Government Printing Office, 1978/1979

Minerals Yearbook

1978-79

Volume III

AREA REPORTS: INTERNATIONAL

Prepared by staff of the

BUREAU OF MINES

UNITED STATES DEPARTMENT OF THE INTERIOR • James G. Watt, Secretary

BUREAU OF MINES

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities to protect and conserve our land and water, energy and minerals, fish and wildlife, and park and recreation areas, and for the wise use of all those resources. The Department also has a major responsibility for American Indian reservation communities and for the people who live in Island Territories under U.S. administration.

U.S. GOVERNMENT PRINTING OFFICE

WASHINGTON : 1981

Foreword

The Federal Government, through the Minerals Yearbook and its predecessor volumes, has reported annually on mineral industry activities for 98 years. In the interest of expediting the release of minerals data, this edition of the Yearbook covers both 1978 and 1979. It discusses the performance of the worldwide mineral industry during 1978 and 1979 and provides background information to assist in interpreting developments during the years being reviewed. Content of the individual volumes follows:

Volume I, Metals and Minerals, contains chapters on virtually all metallic and nonmetallic mineral commodities important to the U.S. economy. In addition, it includes a chapter on mining and quarrying trends.

Volume II, Area Reports: Domestic, contains chapters on the mineral industry of each of the 50 States, the U.S. island possessions in the Pacific Ocean and the Caribbean Sea, and the Commonwealth of Puerto Rico. This volume also has a statistical summary.

Volume III, Area Reports: International, contains the latest available mineral data on more than 130 foreign countries and discusses the importance of minerals to the economies of these nations. Separate chapters review the international minerals industry in general and its relationship to the world economy and ocean minerals.

The Bureau of Mines continually strives to improve the value of its publications to its users. Therefore, the constructive comments and suggestions of readers of the Yearbook will be welcomed.

Director

Acknowledgments

The Bureau of Mines, in preparing this volume, utilized extensively statistical and other basic data on mineral production, consumption, and trade provided by various foreign government mineral and statistical agencies through a variety of official publications. The cooperation and assistance of these agencies is gratefully acknowledged. Statistical and informational material was also obtained from airgrams of the U.S. Department of State, from United Nations publications, and from the domestic and foreign technical and trade press. Of particular help in preparing this volume were the routine and special reports submitted by the minerals, petroleum, economic, and commercial officers and other members of the Department of State. Their contributions are sincerely appreciated.

The text and tables of this volume were prepared by the staff of the Branch of Foreign Data, Division of Production/Consumption Data Collection and Interpretation. Final correlation and checking of this volume were performed by the Branch of Publication Support Services of the Division of Publication.

The regimes of some countries reviewed in this volume are not recognized by the U.S. Government. The information contained herein is technical and statistical in nature and is not construed as conflicting with or being contradictory of U.S. policies toward these countries.

Albert E. Schreck, *Editor-in-Chief*

Minerals in the World Economy

By Charles L. Kimbell[1]

The year 1979 was a period of increased activity for the world's mineral industry, distinctly in contrast with 1978 when estimated world crude mineral output value declined slightly and most phases of the industry's activity were somewhat curtailed. In 1979, most major mineral commodities recorded significant gains in output, with a substantial number achieving new record highs; details on trade levels for 1979 were not available, but increases over those of 1978 were expected on the basis of partial data. Consumption of most commodities edged higher; in some cases the higher demand levels were met largely through draw-downs of stocks accumulated in recent years, while in other cases notable output increases were required to meet demand.

Actually, 1978 was not a bad year for all elements of the mineral industry if changes in output levels of the various commodities are considered as a measure of performance. There were far more individual commodities registering production increases between 1977 and 1978 than registered declines, but some of those reported as declining were relatively major commodities (bauxite, aluminum, copper and zinc were notable). Moreover, the upturn in productive activity in 1978 was not matched by increases in profits. However, 1979 was unquestionably a year of renewed expansion efforts, although some commodity areas, most notably the steel industry component, were still experiencing difficulties.

During 1978-79, a number of political events—some international in scope, some confined largely to single nations—had significant influence upon world mineral supplies, and other such events had the potential of having significant impact on the world's mineral industry.

Most notable of these was the continuing crisis situation in Iran. In early 1978, industrial activity there was somewhat impaired by civil disorders directed at the regime of Shah Muhammad Riza Pahlavi. Later in 1978 major strikes and riots occurred, and as 1979 began, the Shah departed the nation, leaving the Government in the hands of Prime Minister Baktiar. Among efforts to appease the rebellious factions, that Government officially prohibited oil exports to Israel and the Republic of South Africa, although this was more symbolic than practical because total oil exports had fallen to a trickle as domestic disorders so reduced output that it was barely more than adequate to meet internal demand. It should be noted that curtailment of oil output in early 1979 was probably matched by curtailments in production of virtually all other mineral products, although reporting on such activities has been very sparse and of questionable value since the deposal of the Shah. There was evidence of some resumption of activities in the early spring of 1979 as the Baktiar regime was replaced by the provisional government of Mehdi Bazargan, the group installed by Ruhollah Khomeni, but restoration of normal economic activity was impossible owing to civil disorders that continued to plague the nation, most significantly those in oil-rich Khuzistan Province and neighboring Kurdistan, both along the Iran-Iraq border, where Arabic ethnic minorities complained of oppression by the Khomeni regime and where problems flared into open fighting with the revolutionary militia.

The November seizure of the U.S. Embassy led to a new round of problems for Iran's mineral industry—termination of shipments of oil industry equipment from the

United States, the freezing of all Iranian assets in the United States, and further displays of unrest in Iran itself, where through yearend the provisional government often was unable to establish policy awaiting decisions from Khomeni. Although reporting of general mineral industry activities has been very sparse, it is believed that almost all elements of Iran's mineral industry suffered substantially during this period.

Of less significance to the world, but with rather ominous overtones, was the U.S.S.R.'s massive military intervention in the internal civil strife in Afghanistan, in late December 1979. The nation's small developed mineral industry has little significance to the rest of the world except for modest natural gas exports to the U.S.S.R.; the landlocked country's undeveloped mineral potential, somewhat more promising than that thus far developed, seemed more of a prize. Perhaps more significant, however, was the Soviet presence in this nation, on the eastern border of troubled Iran, and near the strategic Persian Gulf Strait of Hormuz, through which must move a very large part of the oil exports from Iran, Iraq, Bahrain, Kuwait, Saudi Arabia, Qatar, and the United Arab Emirates.

Elsewhere, civil strife and international economic sanctions adversely affected mineral industry output in Southern Rhodesia during 1978-79. In this country, briefly styled "Zimbabwe-Rhodesia" and slated to become simply "Zimbabwe" in 1980, the establishment of a black majority government led to a cease-fire between government troops and rebels in late 1979, to a lifting of economic sanctions, and to publication for the first time in 16 years of detailed production statistics on the output of all major mineral commodities. These data, at least for the most recent 4 years, appear in the Southern Rhodesia chapter of this volume.

In Zaire, civil strife, intensified by rebels operating from adjacent Angola, sharply curtailed copper-cobalt mining and processing activities in the Shaba (formerly Katanga) copper belt area in May 1978, and although these problems temporarily curtailed mining activities in the area and drove cobalt prices to record highs (a 350% increase between January 1978 and February 1979), industry activities seem to have settled to a more normal level by yearend 1979.

In northern Africa, the rich phosphate potential of the Western Sahara area, formally annexed by Morocco and Mauritania in 1976, remained inoperative due to insurgent activities, backed according to Moroccan authorities by Algerian interests. On August 5, 1979, Mauritania renounced its claim to any portion of Western Sahara, in favor of the guerilla organization, leaving Morocco to continue the struggle on its own. This dispute represented only a part of Mauritania's mineral industry setbacks: The recession-status of the world steel industry curtailed exports of iron ore, Mauritania's foremost mineral product, and the country's single substantial copper mine closed in 1978.

Slightly to the south, Liberia's Government was under considerable pressure as a result of economic conditions which involved, among other elements, the depressed world iron ore market (one of Liberia's major exports) and increased petroleum prices (one of the nation's major imports).

The nations of Eastern Europe seemed to be experiencing difficulties in meeting performance goals set under the various development plans so popular in that area. Details of these shortfalls are provided in individual country chapters in this volume.

In Southeast Asia, Vietnam, just showing signs of recovery from over 20 years of warfare of one kind or another, suffered severely from the Chinese invasion of late 1978 and early 1979, and several elements of that country's mineral industry were substantially affected. In neighboring Laos and Cambodia, little progress in mineral industry development was discerned, and internal political strife continued.

In mainland China, continued improvement of relations with the west led to increased flow of information on mineral industry development and activities, and to growing efforts directed toward a "transfusion" of technology. The most prominent mineral-related commodities traded between the United States and mainland China in 1979 (following the establishment of diplomatic ties) were petroleum machinery (the United States to China) and tin (China to the United States).

In the Western Hemisphere, Mexico registered substantial economic growth based on its blooming oil industry; this growth was significantly influenced by the unstable conditions of the Near East.

In Bolivia, a successful coup by the military against the recently installed Guevara Government led to general strikes that included the nation's tin mines in late 1979, curtailing that country's mining output for the last 2 months of the year.

In Chile, mineral industry activity was strengthened as general economic conditions showed improvements; the runaway inflation rate seemed to be being curbed and new government appointments were made to the posts of economics minister and minister of mining, these jobs being filled by individuals known to be strong supporters of free enterprize and denationalization. It remained to be seen, however, what effects if any, this might have on the nation's huge copper industry.

PRODUCTION

The estimated value of world crude mineral production in 1979 was $201,300 million in terms of constant 1973 dollars, nearly 5.2% above the 1978 level of $191,400 million and 4.2% above the revised 1977 level of $193,100 million. The value increase was somewhat higher than the actual quantitative increase, however, because of generally higher unit prices in the more recent years. The following tabulation summarizes approximate data on value of world mineral production for selected years:

Year	Billion constant 1973 dollars	
	Value of 53[1] major crude mineral commodities[2]	Value of all crude mineral commodities[3]
1950	46.2	52.6
1953	60.3	69.3
1958	77.4	93.0
1963	85.6	104.9
1968	99.2	120.2
1973	159.2	189.6
1974[r]	161.3	180.7
1975	[r]152.3	170.6
1976[r]	164.5	184.2
1977[r]	172.4	193.1
1978	170.9	191.4
1979	179.7	201.3

[r]Revised.
[1]The list of commodities included appears in table 5 of the 1974 edition of this chapter; one commodity covered in 1950-68 (beryl) is excluded from the 1973-77 figures, but the overall impact of this omission is regarded as insignificant.
[2]Data for all years except 1974-77 are as reported in Annales des Mines, December 1975, p. 13; data for 1974-77 are extrapolated from the 1973 Annales des Mines figures on the basis of the United Nations index of extractive industry production in the United Nations Monthly Bulletin of Statistics, August 1979, p. xiv.
[3]Data extrapolated from those values for 53 commodities to compensate for commodities not included in the source of that data. For details on the basis of extrapolation, see relevant text in the 1974 edition of this chapter under "Value of World Mineral Production."

The foregoing data belittle the role of the mineral industry in the world economy, however, by representing only an approximation of the value of crude production from mines, quarries, and wells, rather than the enhanced value that results from beneficiation, smelting, refining, and other equivalent downstream processing. Moreover, these data do not reflect value added due to transporting mineral materials from production areas to consuming areas. If the value added through processing—smelting of metals, refining of oil, and manufacture of basic materials such as cement and fertilizers—were included, a 1979 figure on the order of $480,000 million could be regarded as a conservative estimate of the value of output of primary mineral-processing plants. An additional, unestimated increment should also be added for the value of secondary metals produced. It should be stressed that crude and processed mineral commodities constitute not only the overwhelming dominant share of the total raw material base for all manufacturing endeavors, but also represent a significant requirement for the agricultural industries because of that industry's need for fertilizers of mineral origin as well as the overwhelmingly dominant source of energy for industry throughout the world and for individual energy requirements in all developed countries and a number of developing countries as well.

PRODUCTION INDEX PATTERNS

The following tabulation summarizes the growth in world mineral industry output as reflected by the United Nations' indexes (1975=100) for extractive mineral industry components:

Year	Index numbers (1975=100)			
	Coal	Crude petroleum and natural gas	Metals	Total
1973	97.3	106.9	104.6	104.5
1974	96.6	108.4	105.6	105.9
1975	100.0	100.0	100.0	100.0
1976	101.5	110.0	102.4	108.0
1977	102.6	116.2	103.7	113.2
1978	101.9	115.4	101.8	112.2
1979	106.6	122.0	103.8	118.0

Source: United Nations. Monthly Bulletin of Statistics, August 1979, v. 33, No. 8, New York, 1979, p. xiv.

Comparison between the world extractive industry indexes in the foregoing tabulation and the indexes for processing sectors of the mineral industry presented in the following tabulation demonstrate the substantially higher levels of growth in production value for downstream products:

Year	Index numbers (1975=100)		
	Nonmetallic mineral products	Chemicals, petroleum, coal, and rubber products	Base metals
1973	100.3	102.4	107.8
1974	102.8	105.8	110.8
1975	100.0	100.0	100.0
1976	107.7	111.6	107.9
1977	112.6	121.4	109.2
1978	118.5	125.7	114.7
1979	123.1	133.6	120.2

Source: United Nations. Monthly Bulletin of Statistics, August 1980, v. 33, No. 8, New York, 1980, p. xv.

For details on differences in mineral industry index pattern growth for various world areas, see the source publication for the foregoing tabulations.

QUANTITATIVE COMMODITY OUTPUT

Total world production of 95 distinct mineral commodities and/or specific forms of mineral commodities is given in table 1 for 1976-79. Of these commodities, 80 registered gains and 15 recorded declines in 1979 relative to 1978 output levels, compared with 70 reporting gains and 25 recording declines between 1977 and 1978, and 73 reporting gains and 22 recording declines between 1976 and 1977. Of the 48 metals commodities listed, 33 were produced in greater quantities in 1979 than in 1978; of the 36 nonmetals commodities recorded, 30 were produced at higher levels in 1979 than in 1978; and among the 11 fuels listed, all but 2 were produced in greater quantities in 1979 than in 1978. Probably the most notable decline in output in 1979 was that recorded for gold, this in the face of the upward spiraling price for that commodity.

No viable means exists to sum up the overall production performance of the nonfuel mineral industry except on a value basis, and for these commodities, exactitudes on value are not available for detailed review. Among the fuel commodities, however, a pattern of overall growth can be demonstrated by United Nations' data in which all fuels are reduced to a common energy equivalent basis. The following tabulation summarizes world energy output for 1973-79 (1979 data estimated):

Year	Million metric tons of standard coal equivalent				
	Coal	Crude petroleum and natural gas liquids	Natural gas	Hydro and nuclear electricity	Total
1973	2,426	4,247	1,539	186	8,398
1974	2,457	4,261	1,560	209	8,487
1975	2,577	4,054	1,568	224	[1]8,422
1976	2,650	4,381	1,633	232	8,896
1977	2,763	4,569	1,671	250	[1]9,254
1978	2,784	4,557	1,735	257	[1]9,332

[1]Data do not add to totals shown because of independent rounding.

Source: United Nations. World Energy Supplies 1973-78. Statistical Papers, Series J, No. 22, New York 1979, p. 14.

Total output of energy in all forms in 1979 was estimated to be nearly 2.8% above the 1978 level, which in turn was only 0.8% above that of 1977. As a result of the rapidly escalating cost of petroleum and the less-than-sure availability of oil supplies from the Near East, coal production registered a more substantial increase between 1978-79 than did the other fuels.

TRADE

In 1978, the aggregate value of total world trade in mineral commodities reached an estimated $392,500 million, a very modest increase (only 1.7%) above the previous record high set in 1977. Comparable data for 1979 were not available in time for inclusion in this chapter; available information clearly suggested a significant increase, but was far too sparse to provide a basis for a reasonable estimate of the percentage growth. The following tabulation summarizes the growth pattern in mineral commodity trade for 1973-78, as well as the role of that trade in total commodity trade:

Year	Estimated value of all mineral commodities traded (millions)	Change from previous year (percent)	Mineral commodities share of all commodities traded (percent)
1973	$151,800	46.3	26.5
1974	r325,100	r114.2	38.8
1975	r312,800	r3.8	35.8
1976	r353,700	r13.1	35.7
1977	r385,900	r9.0	34.4
1978	392,500	1.7	30.4

rRevised.

Clearly, 1978 marked a pronounced change in the growth of value of mineral commodity trade, in all likelihood as the result of both a lower rate of increase in unit prices for fuel (the factor that was overwhelmingly dominant in the growth rates for both 1973 and 1974 and an actual reduction in the quantities of fuels moved. The rather pronounced decline in the share of total trade accounted for by minerals was, to an extent the result of the increasing value of nonmineral commodities, which in turn was related to minerals in that it reflected the high cost of energy in production of other manufactures.

Table 2, which served as the basis for the estimates of total mineral commodity trade appearing in the foregoing tabulation, provides reported data on the value of trade in major mineral commodity groups and total commodity trade for 1974-78. Table 3 shows the percentage share of major mineral commodity groups in the total trade of these commodities for 1974-78, and table 4 provides individual growth (or decline) rates for each of the major mineral commodity groups for the same years.

Major mineral commodity trade by region (such as tables 8-10 in the 1976 edition) may be obtained for 1974-78 directly from the United Nations' Monthly Bulletin of Statistics for May 1980.

CONSUMPTION

NONFUEL MINERAL COMMODITIES

There was an upturn in the use of most major nonfuel mineral commodities during 1978-79. In the case of some commodities, this growth in use was met by drawdowns of stocks held by both producers and consumers, with little reflection at demand increases in production; but for other commodities there were corresponding increases in output.

MINERAL FUEL COMMODITIES

Data published by the United Nations show a 2.5% increase in total world energy consumption between 1977 and 1978, a somewhat lower growth than the 3.2% increase between 1976 and 1977, and substantially below the 6.0% growth between 1975 and 1976, but well ahead of the 0.4% increase reported between 1974 and 1975. At the time of preparation of this chapter, data for 1979 was not yet available, but a level about equal to the 2.5% 1977-78 increase is suggested, with solid fuels showing the most appreciable gain. The following tabulation summarizes world total energy consumption by source for 1973-78:

Year	Million metric tons of standard coal equivalent				
	Solid fuels	Liquid fuels	Natural gas	Hydro and nuclear electricity	Total
1973	2,452	3,578	1,517	187	7,734
1974	2,489	3,535	1,545	209	[1]7,779
1975	2,516	3,524	1,545	224	[1]7,808
1976	2,646	3,770	1,633	231	8,280
1977	2,744	3,896	1,651	250	8,541
1978	2,803	3,959	1,737	256	8,755

[1]Data do not add to totals shown because of independent rounding.

Source: United Nations World Energy Supplies 1973-78. Statistical Papers, Series J, No. 22, New York, 1979.

From this tabulation, it is evident that between 1977 and 1978, growth in natural gas (up 5.2%) was the most substantial component of the overall energy consumption growth, reflecting efforts of producing nations to utilize a great proportion of their gross production of this commodity, reducing flaring, venting to the atmosphere, and reinjection to reservoirs to the maximum extent possible. Use of all other energy forms grew also, but at rates lower than that of total energy use. As a result, natural gas accounted for 19.84% of total energy consumed, only a fractionally lower share than its recorded high (19.86%) set in 1974.

INVESTMENT

Data published by the U.S. Department of Commerce relating to U.S. foreign investment in mineral industry activities show continued growth in petroleum related activities during 1976-79 inclusive, but with a sharply higher increase in 1979 than in foregoing years; in contrast, investment in mining, which advanced only marginally in 1976-77, turned downward in 1978, and then showed a considerable upturn in 1979. However, these growths, measured in terms of current dollars, would be substantially less significant if they were to be deflated to adjust for the inflation rate.

Unfortunately, reasonably comprehensive data on worldwide mineral industry activity are not available for 1979, and for 1978 only a few geographic and commodity areas are available. Table 5, showing Organization for Economic Cooperation and Development (OECD) data on steel industry investment shows the 1978 downturn reflected also in U.S. foreign mining investment data, which, together with that for petroleum, both for 1978-79, are presented in table 6. The data for 1978 presented in table 5 have not been totaled owing to the absence of figures for Japan which accounted for over one-third of the 1977 total for OECD countries.

TRANSPORTATION

MARINE TRANSPORT

Tankers, bulk carriers, and freighters are the three classes of vessels engaged in transporting mineral commodities. The number, gross tonnage, and deadweight tonnage of these vessels, as reported by the U.S. Maritime Administration for 1974-78 are given in table 7. Although there is a modest difference in reporting categories between 1974 and 1975-78, this difference (inclusion of refrigerated vessels among freighters rather than among other vessels in the latter period) is of little overall significance. It should be noted that vessels in each of the three categories are not wholly devoted to mineral commodity transport. Tankers, although largely engaged in moving crude oil and refinery products, also transport some liquid chemicals, wine, molasses, and whale oil. Bulk carriers move agricultural products as well as crude minerals and mineral fertilizers, while freighters, because of their great variety, can be wholly devoted to hauling mineral products or wholly to moving nonmineral goods, as well as carrying mixed mineral and nonmineral cargos.

Table 8 gives information on total loadings and unloadings of vessels, divided between tanker-type cargo and dry cargo, for the years 1974-78. While it is recognized that these figures on loadings and unloadings include goods other than minerals, they nevertheless serve as a reasonable measure of mineral commodity shipments, because the preponderance of total weight of all goods moved is accounted for by minerals. Some measure of the significance of mineral commodity movement to total commodity movement is apparent in data for the world's two major canals, the Panama and the Suez, and it should be noted that figures for these waterways are skewed in favor of nonmineral commodities by both waterways' inability to handle large supertankers and bulk cargo vessels engaged in ore trade. Although exact recent figures are not available, it appears likely that minerals and mineral products account for three quarters or more of total cargo carried in any 1 year on a weight basis.

Tables 9 and 10 provide a geographic breakdown of loadings and unloadings of dry cargo and tanker cargo, respectively, for 1976-78 on a tonnage basis. Again recognizing that both tables include mineral and nonmineral goods, but also recognizing the dominance of mineral materials from the viewpoint of tonnage, these tables give some idea of the relative importance of various world areas as origins and destinations for mineral materials.

Bulk Carriers.—In 1978, the world's bulk carrier fleet decreased by 281 vessels, compared with an increase of 362 vessels in 1977. This represented a 5.7% decline growth in 1978 on the basis of the number of vessels, but in terms of gross tonnage there was a 0.5% increase and in terms of deadweight tonnage there was a 1% increase demonstrating the continued gradual shift toward larger vessels. In 1978, the average bulk carrier grossed 22,423 tons and had a deadweight tonnage of 38,795 compared with 1977 figures of 21,034 and 36,219 tons, respectively. The following tabulation shows the distribution of the world bulk carrier fleet by country of registry in 1978:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	932	43,109
Greece	784	23,161
Japan	517	21,992
Norway	267	16,519
United Kingdom	252	12,227
Panama	309	7,604
Italy	151	7,503
India	104	4,382
Germany, Federal Republic of	63	5,573
Sweden	54	3,277
U.S.S.R	150	2,895
France	52	2,762
Singapore	77	2,629
Poland	79	2,274
China, mainland	67	2,105
Brazil	33	2,041
Spain	63	2,035
Other	697	20,348
Total	4,651	180,436

Freighters.—In 1978, the world's freighter fleet increased by 1,965 vessels, a 16.1% increase. In terms of gross tonnage, there was only a 7.7%, increase and in terms of deadweight tonnage the increase was only 7.4%; thus average vessel size decreased for the first time in several years. The average freighter in 1978 had a gross weight of 6,202 tons (6,686 tons in 1977) and a deadweight tonnage of 8,341 tons (9,022 tons in 1977), a substantial decrease when the number of vessels involved is considered. The following tabulation shows the distribution of the world's freighter fleet by country of registry in 1978:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Greece	1,484	13,993
Panama	1,572	12,057
U.S.S.R.	1,801	10,858
United States	481	6,874
Japan	782	6,783
Liberia	610	6,655
United Kingdom	589	6,185
Germany, Federal Republic of	443	4,202
China, mainland	405	4,127
Singapore	428	3,749
India	220	2,583
Norway	271	2,532
Cyprus	427	2,511
Netherlands	348	2,398
Other	4,280	32,446
Total	14,141	117,953

It is noteworthy that Panama displaced the U.S.S.R. as the second ranked nation in terms of deadweight tonnage; this followed the U.S.S.R.'s loss of first place to Greece in 1977.

Tankers.—In 1978, the world's tanker fleet was 100 vessels smaller than in 1977, a decrease of 1.9%. The gross tonnage for vessels of this class declined by 1.6% and the deadweight tonnage by 1.5%. The declining number of tonnages of tankers reflected the reduced growth rates in world petroleum movement and supply. The upward trend in the average size of tankers however continued, with the average tanker in 1978 grossing 34,849 tons (34,766 tons in 1977) and having a deadweight tonnage of 65,885 tons (65,625 tons in 1977). The following tabulation distributes the world's tanker fleet by country of registry in 1978:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	883	104,303
Japan	473	31,129
Norway	315	30,738
United Kingdom	357	27,927
Greece	364	19,689
France	128	14,754
United States	302	13,924
Panama	251	12,617
Italy	226	9,487
Spain	131	9,340
U.S.S.R.	471	7,321
Germany, Federal Republic of	81	6,497
Sweden	76	6,294
Denmark	74	5,631
Singapore	112	5,538
Netherlands	63	4,293
Other	926	35,298
Total	5,233	344,780

OCEAN FREIGHT RATES

Following a general (although not universal) downturn in ocean freight rates between 1976 and 1977, the worldwide inflationary spiral accentuated by ever-increasing fuel costs had the inevitable effect of increasing shipping costs, and thus freight rates increased for both tanker cargos and dry cargos, virtually without any exception, throughout 1978-79. By yearend 1979, most of the various rates listed by the United Nations in their Monthly Bulletin of Statistics (tables published in January, March, June, and September issues) had reached levels that were nearly double to more than double the 1977 level, and in a few cases were about three times the 1977 rate.

PANAMA AND SUEZ CANALS

The Panama Canal reported overall increases in activity during both 1978-79 (fiscal years ending September 30 of each year), both in terms of the number of vessels transiting the canal and in terms of the amount of cargo moved—both mineral commodities and other commodities as shown in the following tabulation:

	Fiscal year[1]		
	1977	1978	1979
Number of transits:			
Commercial ocean traffic	11,896	12,677	12,935
Other traffic	1,191	1,131	1,427
Total	13,087	13,808	14,362
Cargo moved:			
Commercial ocean traffic:			
Mineral commodities thousand metric tons	[r]66,195	83,614	90,082
Other commodities do	[r]58,758	61,191	66,503
Subtotal do	124,953	144,805	156,585
Other traffic do	219	304	370
Total do	125,172	145,109	156,955

[r]Revised.
[1]Year ending September 30 of that stated.

At the end of fiscal year 1979 (September 30), the legal status of the canal area altered markedly, as the Panama Canal Zone ceased to exist, after 65 years of operation of the canal.

In fiscal year 1979, mineral commodities accounted for 57.5% of all commercial ocean traffic through the Panama Canal, a slightly smaller share than the 57.7% of fiscal year 1978, but greater than the 53.0% share accounted for by minerals in fiscal year 1977.

The following tabulation distributes mineral commodity trade through the canal during 1977-79 by major group:

Commodity group	Thousand metric tons		
	1977	1978	1979
Metals:			
Ores and concentrates:			
Bauxite	1,194	1,414	1,184
Chromite	132	134	160
Copper	514	696	508
Iron	2,837	1,600	1,163
Lead	254	117	144
Manganese	396	314	485
Tin	68	63	55
Zinc	628	685	739
Other and unspecified	1,140	1,383	1,524
Total	7,163	6,406	5,962
Ingots and semimanufactures:			
Aluminum	116	100	280
Copper	802	838	895
Iron and steel [1] [2]	10,296	11,478	10,763
Lead	106	147	120
Tin[1]	161	160	141
Zinc	138	157	98
Other	217	244	234
Total	11,836	13,124	12,531
Nonmetals:			
Borax	476	465	462
Cement	389	369	309
Clays, fire and china	322	266	423
Fertilizers	7,278	8,059	9,350
Salt	851	853	931
Sulfur	1,260	1,277	1,481
Other	402	398	798
Total	10,978	11,687	13,754
Mineral fuels:			
Carbon black	12	84	154
Coal and coke	13,128	11,093	14,111
Petroleum:			
Crude	12,799	32,843	30,478
Refined	10,279	8,377	13,092
Total	36,218	52,397	57,835
Grand total	66,195	83,614	90,082

[1]Tinplate is included under tin in source publication.
[2]Includes a category identified simply as "scrap" in source publication, which may include scrap other than iron and steel scrap.

In terms of the major mineral commodity groups, fuels were dominant in each year, 1977-79, increasing their share of the total tonnage from 54.7% in 1977 to 64.2% in 1979, as crude oil supply patterns were altered. Metals ranked second, with steel semimanufactures as the dominant single commodity element; among the nonmetallics, fertilizer materials were overwhelmingly dominant.

For greater detail on mineral movements through the Panama Canal, see the Panama Canal Company Annual Report series.

More recent detailed data on Suez Canal operations than that included in the 1977 edition of this chapter have not become available since its preparation, but general reports clearly show that there was an increase in the volume of cargo moved through the canal in 1978-79, although details on the role of mineral commodities in this trade are not available. Efforts to make possible the handling of larger vessels continued.

PIPELINES

Limitations of time and space preclude a detailed appraisal of worldwide progress on pipelines; major projects in individual countries are reported within the individual country chapters.

PRICES

Comprehensive data on world prices for crude minerals and mineral products are not available; tables 11, 12 and 13 summarize nonferrous metal prices in the United States, the United Kingdom and Canada respectively, for 1976 to 1979 inclusive, with monthly data provided in each case for 1978 and 1979. For these 2 years, the general trend for each of the major metals listed was upward; there were minor fluctuations on a monthly basis which can be noted from the tables, but except for the U.S. copper-zinc prices for 1978 and the Canadian zinc price for 1978, all 1978 annual average prices topped 1977 annual averages, and without exception, 1979 annual averages topped those of 1978 in all three markets.

Probably the most noteworthy price trends not demonstrated in tabular form for 1978-79 were the continued growth in fuel prices, particularly for crude oil and its products, with the obvious impact on the prices of all goods whose production requires significant expenditures for energy materials. However, rivaling these in importance was the sharp upturn in the price of gold beginning in the last few months of 1979. (A similar, although somewhat more steady, increase in silver prices is reflected in tables 11-13.) This upturn in gold, far more the result of speculative buying than any upturn based either on normal supply-demand imbalance or increasing cost of mining-processing, continued at a frantic rate at yearend 1979, with the price topping $600 per troy ounce, and although destined ultimately for a sharp decline, that point was not reached within 1979.

STATISTICAL SUMMARY OF WORLD PRODUCTION AND TRADE OF MAJOR MINERAL COMMODITIES

The final 24 tables of this chapter (tables 14-37) extend the statistical series on production that was started in the 1963 edition of the International Area Reports volume of the Minerals Yearbook and was subsequently updated and expanded in the 1965 and 1967-77 editions. They are primarily a supplement to other statistical data within this chapter but also serve as a summary of international production data for major mineral commodities covered in greater detail on a commodity basis in volume I of the 1976 Minerals Yearbook and on a country basis in the balance of volume III.

In this edition, the data presented in these tables in most instances correspond both with the data in the individual commodity world production tables appearing in volume I and in the individual country chapters of volume III. The few differences that exist are the result of the receipt of revised data for inclusion in a country chapter subsequent to the completion of the commodity chapter. The most notable example is the inclusion in these tables and in the commodity chapter of actual reported figures for Southern Rhodesia (Zimbabwe-Rhodesia), where official reports of actual output for the past 15 years became available at midyear 1980.

One of the commodities covered is reported on a different basis than in foregoing editions; nitrogen, previously reported on the basis of the nitrogen content of nitrogen fertilizers produced, is reported in this edition in terms of the nitrogen content of ammonia production. This is regarded as an improvement over the previous reporting practice in two respects. First, it represents a more complete coverage of the commodity than was the case previously, for it covers not only that nitrogen used in fertilizer production, but also that used in the manufacture of nonfertilizer nitrogen-containing chemicals (leaving only nitrogen gas not included, which is not within the scope of the Bureau's responsibilities). Second, the new series reflects the production of the nitrogen at the first measurable stage of its production, whereas the former reporting practice measured in some cases a downstream product produced in part from imported ammonia.

Regretfully, the series of data on world trade in major mineral commodities that has appeared in most previous editions of this chapter (tables 57-69 in the 1976 edition) could not be included for a second year owing to scheduling problems. Hopefully, these tables will be resumed in the 1980 edition.

---

[1]Supervisory physical scientist, Geographic Statistics Staff, Branch of Foreign Data.

Table 1.—World production of major mineral commodities[1]

Commodity and unit of measure	1976	1977	1978[p]	1979[e]

[e]Estimate. [p]Preliminary.
[1]Incorporates numerous revisions from world production tables and country production tables appearing in volumes I and III, respectively, of the Minerals Yearbook, as well as from the table corresponding to this table in previous editions of this chapter.
[2]Includes bauxite equivalent of nepheline syenite and alunite produced in the U.S.S.R. (the only producer on record of such materials as a source of aluminum).
[3]Excludes data for the United States (withheld to avoid disclosing company proprietary data).
[4]Excludes data for China (no adequate basis for estimation available).
[5]Excludes data for the U.S.S.R. (no adequate basis for estimation available).
[6]Includes all metal clearly identified as primary as well as all metal that cannot be subdivided clearly between primary and secondary (see footnote 7).
[7]Includes only that metal that is clearly identified as secondary. Some countries do not distinguish between primary and secondary and for some of these, no basis is available for estimating the breakdown of total production. For such countries, the total has been included under primary (see footnote 6).
[8]Excludes data for the United States (withheld to avoid disclosing company proprietary data), which in previous years accounted for approximately 50% of the world total.
[9]Includes leucoxene.
[10]Data are for years ending June 30 of that stated.
[11]Comprises sulfur produced by the Frasch process plus sulfur mined in the elemental state from ores.
[12]Comprises sulfur recovered from coal gasification, metallurgical operations (except pyrite processing), natural gas, petroleum, tar sands, spent oxides, and gypsum, whether recovered in the elemental state or as a sulfur compound.
[13]Production of coke other than metallurgical by China and the U.S.S.R. is included with metallurgical coke production.

Table 2.—Value of world export trade in major mineral commodities[1]

(Million U.S. dollars)

Commodity group	1974[r]	1975[r]	1976[r]	1977[r]	1978

[r]Revised.

[1]Data presented are for selected major commodity groups of the Standard International Trade Classification Revised (SITC-R) and as such exclude some mineral commodities classified in that data array together with other (nonmineral) commodities. SITC-R categories included are as follows: All ores, concentrates, and scrap—SITC Division 28; iron and steel—SITC Division 67; nonferrous metals—SITC Division 68; nonmetals (crude only)—SITC Division 27; and mineral fuels—SITC Division 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and other coal-, petroleum-, and gas-derived crude chemicals of SITC Division 52; manufactured fertilizers of SITC Division 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667. Data include special category exports, ships' stores and bunkers, and other exports of minor importance, and exclude the intertrade of the centrally planned economy countries of Asia and trade between the Federal Republic of Germany and the German Democratic Republic.

Total	[3]12,054	r [3]10,846	NA

rRevised. NA Not available.

[1]Source reports that values for European Economic Community (EEC) countries are in terms of "million units of account." For the Federal Republic of Germany (included in EEC in this tabulation), the source indicates that for 1976, 823.1 million "units of account" was equivalent to $885.3 million (no conversion rate given for other countries for 1976 and no conversion rate given for any country for 1977, and no further explanation is offered).

[2]European Free Trade Association (EFTA) figures exclude data for Switzerland.

[3]Figures have been totaled as if EEC data were in U.S. dollars, in keeping within totals appearing in a graph in source publication (see footnote 1).

Table 32.—Leading world producers of elemental sulfur[1] —Continued

(Thousand metric tons)

Country	1976				1977				1978[p]				1979[e]			
	Native	From pyrite	Byproduct	Total	Native	From pyrite	Byproduct	Total	Native	From pyrite	Byproduct	Total	Native	From pyrite	Byproduct	Total
All others	[r]121	[r]863	[r]1,263	[r]2,247	131	735	1,388	2,254	421	792	1,394	2,607	94	806	1,541	2,441
Grand total	[r]17,086	[r]9,426	[r]24,376	[r]50,888	16,449	9,413	26,231	52,093	17,124	9,469	26,806	53,399	17,913	9,862	27,059	54,834

[e]Estimate. [p]Preliminary. [r]Revised.

[1]Includes all recorded production of sulfur, regardless of the form in which it is recovered. Thus, it includes elemental sulfur, whether mined by conventional methods or by the Frasch process, as well as (1) elemental sulfur and the S content of compounds such as H_2S, SO_2, and H_2SO_4 recovered as a principal product of pyrite mining and as a byproduct of the recovery of crude oil and natural gas and as a byproduct of petroleum refining, coal treatment, and metal smelting and/or refining; and (2) sulfur recovered from tar sands, spent oxides, and other miscellaneous sources.

[2]Entirely Frasch-process sulfur.

[3]Includes Frasch-process sulfur as follows, in thousand metric tons: Poland: 1976—4,341; 1977—4,321; 1978—4,546; and 1979—4,500; the U.S.S.R. (estimated): 1976—500; 1977—500; 1978—800; and 1979—800; and total of individually listed countries and grand total: 1976—13,842; 1977—13,080; 1978-13,412; and 1979-14,277. The balance is mined elemental sulfur.

Total	[r]946	968	969	1,065
All others	[r]97	114	111	112
Grand total	[r]1,043	1,082	1,080	1,177

[e]Estimate. [p]Preliminary. [r]Revised.

[1]Every effort has been made to include only those natural gas liquids produced by natural gas processing plants and to exclude natural gas liquids obtained from field treatment facilities including wellhead separators, because the latter are normally blended with crude oil and thus are included in crude oil output statistics. In some cases, however, sources do not clearly specify whether data presented represent only output of natural gas processing plants or if they include field output. Thus, some of the figures may include field condensate.

[2]In addition to the countries listed, mainland China may also produce natural gas liquids, but available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

Ocean Minerals

By William T. Cocke[1]

The mining of deep seabed nodules, although yet to become a commercial reality, was the subject of much discussion on both national and international levels during 1978 and 1979. These nodules, which could become a significant future source of nickel, copper, cobalt, and manganese, are found in large quantities in deep ocean areas beyond the jurisdiction of any nation. The Third United Nations Conference on Law of the Sea (UNCLOS III) has sought to establish an international regime to control the exploitation of the nodules. The Seventh and Eight Sessions of UNCLOS III convened in 1978 and 1979, respectively, but no final consensus was reached, and no agreement was forthcoming.

Domestic seabed mining legislation was introduced into both the 95th and 96th Congresses. A bill was passed by the House of Representatives in 1978 and another by the Senate in 1979, but neither was further acted upon.

There was much activity also by international ocean-mining consortia. Several prototype mining tests were conducted, demonstrating the concept of nodule recovery. Development of nodule-processing techniques continued, and plans for construction of pilot processing plants were announced. There also was curtailment of seabed mining activities by some major partners within the various consortia.

There was considerable activity in offshore exploration, especially for sand and gravel. The rapid increase in the price of gold stimulated exploration activity for offshore gold deposits throughout the world.

LAW OF THE SEA

The Seventh Session of UNCLOS III was convened in Geneva from March 28 to May 19, 1978. At the outset, 2 weeks of debate ensued concerning the reelection of Mr. Amerasinghe, who has served as president since 1973.

Seven negotiating groups (NG's) on outstanding key issues were established. Only the first three were related to Part XI of the Informal Composite Negotiating Text (INCT) dealing with deep seabed mining. NG-1 was to consider the system of exploration and exploitation and resource policy, NG-2 was to consider financial arrangements, and NG-3 was to consider the composition of the organs of the International Seabed Authority (Authority) and their powers and functions. The various NG's issued revised texts, which showed improvement over the ICNT and offered improved prospects of achieving consensus.

The major features of the NG-1 text were as follows: (1) Transfer of technology was no longer a condition of obtaining a deep seabed mining contract. (2) There is no longer automatic conversion from the parallel system of exploitation to a unitary system if the Review Conference, which meets 20 years after the approval of the first contract, fails to reach agreement of a revised mining system within 5 years; however, a moratorium of new contracts could still be invoked. (3) A provisional U.S.—Canadian agreement on production limitation was incorporated. (4) The coordination of marine scientific research by the Authority was eliminated.

The major feature of the new texts issued by NG-2 was the articles on financial arrangements that were redrafted in a way far clearer than the ICNT. Several systems were under consideration although no agreement was reached. The MIT Cost Model was used as a basis for discussion.

Revised texts forwarded by NG-3 contained only minor changes. The issue of composition and voting in the Council, the major organ of the Authority, was discussed at length but was not resolved.

The Seventh Session resumed in New York on August 21, 1978, and concluded on September 15, 1978. Although steady progress toward completion was made on less controversial matters during the Conference, the key issues dealing with deep seabed mining remained intractable. At the outset of the session, the Chairman of the Group of 77 (G-77), speaking on behalf of 119 delegations of developing countries, urged industrialized nations to refrain from enacting unilateral legislation on deep seabed mining, claiming that such mining activities would violate international law and would seriously prejudice the prospect for agreement in negotiations.

Negotiations in NG-1 centered on selection of applicants for seabed mining contracts. Discussions on technology transfer were deferred and minimal progress was achieved.

Negotiations in NG-2 concerning financial arrangements exposed widely varying assumptions on the part of developed and developing countries, and emphasized the difficulty of arriving at a common agreement on economic limits of financial obligation. Application fees, annual fees, production charges, and profit-sharing were all considered. Both royalty-only and royalty-plus-profit-sharing plans were proposed. Problems arose concerning the choice of an internal rate of return of 15%, which was used as the baseline case in the MIT Cost Model; and with attributable net proceeds (ANP), or that part of capital costs attributable to mining but excluding transportation and processing costs.

There was little substantial difference between the revised texts from NG-3 and the ICNT. Composition of the organs of the Authority remained the most contentious issue.

Some 90% of the issues confronting the Conference were resolved to the satisfaction of the United States and most participants, such as the right of transit through international straits, overflights, conservation of living resources, protection of the marine environment, and fishing rights. However, the following outstanding key issues associated with deep seabed mining remained unresolved: (1) Assured non-discriminatory access to minesites, (2) production contracts, (3) the Review Conference, (4) power of the Authority, (5) transfer of technology, and (6) financial arrangements and profit-sharing.

The Eighth Session of UNCLOS III met in Geneva from March 19 to April 27, 1979. The G-77 presented a statement on the first day challenging the legality of unilateral deep seabed mining. For the first 2 weeks, the Conference concentrated on deep seabed issues of Committee I. A Working Group of 21 (WG-21) was established to consider issues not yet resolved in NG-1, NG-2, and NG-3. The Chairman of Committee I also established a Group of Legal Experts to work on the important problems of settlement of disputes with respect to the seabed. Similarly, a Group of Technical Experts was working on the question of production limitations.

The revised texts from NG-1 included changes concerning transfer of technology, whereby the obligation to the contractor was not contingent upon the nonavailability of the technology on the open market, and transfer within fair and reasonable commercial terms would be settled by commercial arbitration. The so-called Brazil Clause, which requires transfer to developing nations, remains. The problem of the Review Conference was not improved upon, and the imposition of a mining moratorium is still permitted.

The revised texts from NG-2 concerning financial obligations were not acceptable to the United States. They outline contractor payments to the Authority through either a royalty-plus-profit-sharing or a royalty-only system and contain application fees and annual fees creditable against royalty payments after production begins. Royalties and profit-sharing were broken into stages which reflect production development. Problems still persist in the figure for ANP. Several incremental systems based on the contractor's profitability were considered. Consensus on financial arrangements was hampered by the fundamental issue of in situ value of the nodules, and the answer might have to await actual operations, at which time mining profit can be determined.

While little progress was made within NG-3 concerning composition of and voting in the Council, the Group of Legal Experts on seabed disputes was able to produce a new text, incorporated into the NG-3 revised text, which clarified questions concerning access to and jurisdiction of the Seabeds Disputes Chamber.

An agreement was reached by the Conference to issue a revision of the INCT, now referred to as INCT/Rev. 1, containing the new texts from the negotiation groups. ICNT/Rev. 1. although not representing consensus, offered an improved basis for further negotiation.

The Eighth Session was resumed in New York from July 16 to August 24, 1979. The work of the Conference was devoted to the major outstanding issues not resolved by INCT/Rev. 1. There were no meetings of NG-1, NG-2, or NG-3; however, the Chairman of the NG's conducted negotiations within the framework of WG-21. The Group of Legal Experts continued its work on settlement of seabed disputes. New texts on financial arrangements moved significantly toward a consensus. Voting in the Council still remains unresolved and there was little discussion concerning composition of the Council. No new texts were issued on transfer of technology. Profit-sharing and the Review Conference remained outstanding issues. Another problem that remains unresolved concerns the fact that the ICNT/Rev. 1 does not limit the sharing of financial benefits of the seabed resources to State Parties to the Conference. Specifically, it might allow national liberation organizations to share the profits and to become party of the treaty. Agreement was reached on an initial tonnage for a minimum floor on seabed production. New proposals on financial arrangements were a major step toward flexibility by applying an incremental schedule of rates.

At the close of the session, the Chairman of G-77 gave a statement reiterating opposition to unilateral deep seabed mining legislation, challenging its legality, and arguing that it would violate good faith in negotiations.

The most important problems remaining in the deep seabed mining provisions are as follows: (1) agreement on finial numbers in the production ceiling; (2) provision for a moratorium on contracts by the Review Conference; (3) composition and voting in the Council; (4) access to commercial arbitration for contractural dispute settlement; (5) the Brazil Clause, time limits, and dispute settlement relating to technology transfer; (6) selection of applicants; (7) financing the Enterprise; and (8) lack of agreement on financial arrangement for profit-sharing.

The Conference decided to hold its final substantive session in two 5-week stages in 1980, the first in New York beginning February 27, and the second in Geneva beginning July 28. A timetable was proposed which called for the final draft and proposed amendments to be completed at the end of the first 1980 session and all final amendments and technical problems to be worked out at the resumed session.

In addition to the sessions, there were formal UNCLOS III intersessional meetings, various group meetings, and informal consultations throughout the 1978-79 period. The United States took part in numerous bilateral and multilateral meetings during this period.

DOMESTIC LEGISLATION

Domestic deep seabed legislation was first introduced in 1971, but progress was hindered by the fear that its unilateral nature would threaten negotiations at the Law of the Sea Conferences. At the close of the Sixth Session of UNCLOS III, however, the

U.S. Government announced support of domestic legislation with the exception of several provisions, primarily those calling for U.S. guarantees covering 90% of industry investment losses to a maximum of $350 million, resulting from an unfavorable UNCLOS III treaty. In lieu of Government guarantees, the Administration favored a "Grandfather rights" provision in the prospective treaty.

H.R. 3350.—On February 14, 1978, the Committee on International Relations of the House of Representatives ordered H.R. 3350 reported with recommendation for amendments. The Committee rejected provisions calling for investment guarantees. It also recommended inclusion of an International Revenue-Sharing Trust Fund.

Hearings were held by the Committee on Ways and Means in April 1978 to consider the revenue-sharing provision. The proposal called for a 3.75% tax on the imputed value of the recovered resources, to be computed on 20% of the market value of the metal derived from nodule processing. The Administration testified in favor of the provision. Testimony on behalf of the American Mining Congress also urged the Committee to accept the proposal, in spite of the fact that industry had consistently opposed revenue-sharing in the past.

The Committee on Interior and Insular Affairs also rejected investment guarantees. Substitute language directed U.S. negotiators at UNCLOS III to insure that any treaty signed by the United States would allow mining operations to continue under "substantially the same" conditions that existed before the treaty. The Committee indicated any treaty that would unduly hamper ongoing U.S. operations would not be accepted.

Elimination of investment guarantees and acceptance of the Revenue-Sharing Fund cleared the way for passage of the bill by a vote of 312-80 of the full house on July 26, 1978. Regulatory jurisdiction was granted to the Department of Commerce over the Department of the Interior by a small vote margin.

S. 2053.—A similar bill, S. 2053, was reported from the Senate Committee on Energy and Natural Resources in May 1978, with an amendment proposal calling for a voluntary insurance plan to protect the industry from investment losses due to an unfavorable UNCLOS III treaty. Regulatory responsibility was placed with the Department of the Interior.

The Committee on Foreign Relations reported the bill in August 1978 with an amendment favoring a revenue-sharing plan. Regulatory authority was granted to the Department of the Interior.

Although substantial agreement was reached by four Committees, S. 2053 never reached the Senate floor for vote. Neither S. 2053 nor H.R. 3350 were acted upon by the Senate before adjournment of the 95th Congress.

During the course of Congressional hearings in the 95th Congress, the Administration's testimony in support of deep seabed mining legislation could be summarized as follows:

1. The legislation must be interim in nature, pending agreement on an UNCLOS III treaty.
2. It must be based on the premise that deep seabed mining is a freedom of the high seas.
3. It must provide for environmental protection, sound management, safety of life and property at sea, and effective law enforcement.
4. It must establish an international revenue-sharing fund.
5. It must encourage recognition of rights of reciprocating states.
6. It must contain requirements that mining and processing vessels, but not transportation vessels, fly the flag of the United States of a reciprocating state.
7. It must not require U.S.-based processing.
8. It must not contain investment guarantees.
9. It must not be misinterpreted as an assertion of sovereignty over specific mine sites.

S.493.—On February 26, 1979, Senator Matsunaga introduced S. 493, the Deep Seabed Hard Minerals Resources Act, into the Senate of the 96th Congress. It was referred jointly to the Committees on Energy and Natural Resources, Commerce, Science and Transportation, and Foreign Relations for consideration.

Hearings were held beginning in March to hear testimony from representatives of the Administration and ocean mining industry, environmentalists, and the general public. Administration witnesses requested amendments to provisions requiring U.S. documentation of vessels and recommended a requirement calling for United States or reciprocating state documentation. The Administration also opposed requirement for location of processing plants in the United States. The Administration testified that the language of the "Grandfather rights" provisions was too strong and inferred moral if not legal obligation to the U.S. Government to compensate companies for losses due to UNCLOS III treaty provisions that were less advantageous. The Administration requested that the data for issuances of licenses be changed to July 1, 1981, and the date for earliest commercial recovery be changed to July 1, 1982. The U.S. Government also requested that provisions of the Clean Water Act be applied to regulation of polluting discharges from seabed mining and related at-sea processing.

The bill was reported with amendments from the Committee on Energy and Natural Resources on May 1, 1979, from the Committee on Commerce, Science and Transportation on July 27, 1979, and from the Committee on Foreign Relations on July 30, 1979. A joint report of the three committees was published August 9, 1979. Amendments listed in the report accomplished the following:

1. Changed the authority for regulatory functions from the Secretary of the Interior to the Administrator of the National Oceanic and Atmospheric Administration (NOAA).
2. Set the date for licenses at July 1, 1981, and earliest date for commercial recovery at January 1, 1982.
3. Called for mining and processing vessels to be constructed and documented in the United States.
4. Laid out requirements for a work plan.
5. Softened the language of the "Grandfather rights" provisions.
6. Struck the provision for stable reference areas.

The bill was referred jointly to the Committees on Finance and Environment and Public Works to consider provisions which dealt with international revenue-sharing. The excise tax proposal called for a 3.75% tax imposed on the imputed value of the nodules removed from the deep seabed. The imputed value for this purpose was 20% of the fair market value of the commercially recoverable metal and minerals contained in the nodules which represents the estimated proportional share of the costs of the mining process itself in relation to the total costs involved in mining, transporting, processing, and marketing the nodules. The proceeds of the tax were to be paid into a Deep Seabed Fund established under Title V of the legislation. The committees reported the bill without amendment on October 3, 1979.

On December 14, 1979, the Senate passed S. 493 after agreeing to the above amendments.

H.R. 2759.— On March 8, 1979, Representative Murphy introduced H.R. 2759, the Deep Seabed Hard Minerals Resources Act, into the House of Representatives of the 96th Congress. It was referred jointly to the Committees on Foreign Affairs, Interior and Insular Affairs, Merchant Marine and Fisheries, and Ways and Means.

Hearings were held by the Committees on Merchant Marine and Fisheries and Interior and Insular Affairs beginning in May. Testimony was given by representatives of the Administration, industry, environmentalists, and the public. The witnesses and testimony were basically the same as for S. 493.

Although the industry basically supported domestic legislation as an alternative to the establishment of an international regime, there were some provisions with which it differed. It opposed setting dates for liscenses and permits for the mid-1980's because provisions would make it impossible to commit large sums of additional funds, although the data for first commercial recovery has been set at about 1985. Industry requested that the "Grandfather rights" provisions be strengthened. Industry was opposed to stable reference areas being set aside. It accepted the profit-sharing provisions and those provisions called for U.S. flag requirements and U.S.-based processing.

The Committee on Interior and Insular Affairs reported the bill on August 2, 1979, with the following amendments: (1) Interior was made lead agency, (2) a workplan was required, (3) U.S. documentation of mining and processing vessels and at least one transport vessel was required, (4) "Grandfather rights" provisions were amended, but not to the extent requested by the Administration, and (5) the dates for issuance of licenses and for earliest commercial recovery were amended as requested by the Administration.

The Committee on Merchant Marine and Fisheries reported the bill on August 17, 1979, with the following amendments: (1) Requirement for applicant certification and work plan were required, (2) a disclaimer of obligation for U.S. Government to compensate industry losses was added to the

"Grandfather rights" provision, (3) the dates for issuance of licenses and permits were adjusted according to Administration recommendations, and (4) U.S. flag requirements for mining and processing vessels and at least one transport vessel were specified.

The Committee on Ways and Means held hearings to consider the subject legislation and on November 2, 1979, reported H.R. 2759 without amendment.

The Committee on Foreign Relations held serveral hearings in 1979 to hear testimony from various witnesses representing the Administration, industry, and the public; however, H.R. 2759 was not reported out of Committee by the close of the 1979 session of the 96th Congress.

OCEAN MINING CONSORTIA ACTIVITIES

Ocean Management Inc. (OMI).—Tests of submerged contrifugal dredge pump and airlift pump systems were conducted by engineers of Inco Ltd. for OMI on three cruises aboard the *Sedco 445* between February 5 and May 20, 1978. On March 28, 1978, OMI became the first of the major consortia to pump nodules from the deep sea floor (5,000 meters) to a surface vessel. About 850 tons of nodules was recovered from an area 800 miles southeast of Hawaii at rates as high as 40 tons per hour. The mining tests were monitored by NOAA's Deep Ocean Mining Environmental Study (DOMES) at the test site located near DOMES Site A from the NOAA vessel, *Oceanographer.*

Due to the uncertain outlook for nickel and copper markets and the legal uncertainty surrounding the fiscal regime under which Deep Seabed Mining (DSM) would operate, no further work was planned by Inco beyond the completion and analysis of this pilot mining test. Inco closed its Bellevue, Wash., office by November 1978, at least three new companies had been formed by former Inco technical personnel. OMI intended to halt work for 3-5 years or until the financial and political climate improves. It was expected, however, that other members of the consortia will continue their DSM programs.

Exploration will continue under the sponsorship of the AMR Group. Walter Kollwentz was appointed as the new president of OMI, and management of the group was moved to the Metallgesellschaft Headquarters in Frankfurt, Federal Republic of Germany. AMR was continuing nodule exploration with a new research vessel, the *Sonne,* which replaced *Valdavia* in July 1978. The *Sonne* was expected to be operating during the next 8 years. AMR was also conducting nodule processing studies. Leaching and smelting and nitric acid reduction methods were being investigated.

Japanese members of OMI were continuing efforts on an increased funding basis. The Japanese Government sponsored the construction of a new deep sea minerals exploration vessel. The $18.6 million *Hakerei Maru II* was launched in November 1979. The Sumitomo Group was also conducting metallurgical investigations.

Ocean Mining Associates (OMA).—On the third cruise of the *Deepsea Miner II* between May 23 and June 29, 1978, engineers from Deepsea Ventures Inc.(DSV) conducted pilot mining tests of an airlift nodule mining system on belf of OMA. Nodule production was first achieved on June 8, 1978, at the DSV "claim" area (approximately 15%N. 126%W), 1,200 miles southwest of San Diego in 4,500 meters of water. The 6,000 to 8,000 tons of nodules that were planned to be recovered from sustained production at design capacity of 1,000 tons per day were not collected due to an early start of the hurricane season. Mining test were monitored by the DOMES project.

On the fourth cruise of *Deepsea Miner II,* which began on October 25, 1978, testing continued for 36 days, during which the system exhibited 90% efficency in nodule recovery. The tonnage of nodules collected, although less than planned, was sufficient for completion of process development tests by consortium partners. United States Steel was conducting pyrometallurgical experiments, while Union Miniere was conducting hydrometallurgical tests in Europe.

It was expected that about 18 months would be required to evaluate the tests. Due to poor metal market conditions and the uncertain status of UNCLOS III negotiations, *Deepsea Miner II* will remain idle for this period. OMA, however, retains strong commitments for exploration and test mining.

Kennecott Group.—During 1978, Kennecott investigated several schemes for a hydraulic nodule collector system; however, no data were released. In late 1978, Kennecott announced that it was terminating its nodule development program, apparently the result of oversupply and low prices in both the nickel and copper markets. The Kennecott Ocean Mining Lab in San Diego has been shut down. No announcement has been made as to further DSM plans of Kennecott or its partners in this effort.

Ocean Minerals Co. (OMCO).—The first cruise of the *Glomar Explorer* in November 1978 into the northeast Equatorial Pacific high-grade nodule zone for the initial testing of the Lockheed-designed airlift hydraulic nodule mining system was terminated prematurely owing to a vessel malfunction, and only the shallow-water testing was completed. The second cruise, in February 1979, was also terminated prematurely this time due to design problems in the nodule collector. There were no immediate plans to return to sea.

OMCO leased the research vessel, *Governor Ray,* for a period of 11 months for nodule deposit explorations. Detailed surveys were conducted in areas planned for mining system tests.

Although OMCO announced plans to build a test plant in Hawaii for processing of seabed nodules, plans were allowed to slip due to unsuccessful mining system tests which were to have provided a supply of nodules. The $4 million plant was expected to begin operations in mid-1979 and was expected to be in operation for 3-5 years. It was to handle about 50 tons of nodules per day at an estimated cost of $1 million per year. Work had not been completed by the end of 1979, and future plans were not disclosed, although the uncertain future of the DSM industry is apparently affecting further expenditures.

Continuous Line Bucket (CLB) Group.—Although airlift and centrifugal pump hydraulic methods were still preferred, there was further work done on the mechanical CLB method. Estimates have shown the CLB method to be more energy-intensive than the hydraulic methods but less capital-intensive. The two-ship CLB test planned for 1979 by Dr. John Mero's Ocean Resources was postponed; plans now call for a test in 1980. The French and Japanese were still investigating this nodule recovery method.

AFERNOD.—The French consortium, AFERNOD, concentrated its study in the high-grade-deposit area of the Pacific Ocean in the Clarion-Clipperton Fracture Zones. It was, however, also investigating areas of other oceans, and the French oceanographic vessel *Marion Dufresne* located nodules in the Indian Ocean in 1979, described as less rich but more plentiful than those in the Pacific Ocean. Nodule densities as high as 100 kilograms per square meter were reported.

Although AFERNOD had investigated hydraulic mining systems and several promising second-generation mining techniques, efforts were directed primarily toward the CLB system. Major difficulties had been identified in the hydraulic system, and exotic shuttle vehicle prototypes constructed by Commissariat a l'Energie Atomique (CEA) and Chantiers de France Dunkerque were felt to be of little commercial interest for the immediate future.

CEA, the French atomic energy commission, constructed two pilot plants in 1978 for testing nodule-processing systems, one each to test the ammonia leach and sulfuric acid leaching methods.

Deep Ocean Mining Associates (DOMA).—DOMA, a consortium of private Japanese companies, had a limited staff and derived its capability from technical committees formed by the Japanese Government and the companies. DOMA received funding and contracts for technical studies from the Japan Ministry of International Trade and Industry (MITI), in addition, the National Research Institute for Pollution and Resources of MITI was continuing sealed-down tests of both one-and-two-ship CLB operations. Little was published of the activities of DOMA with exception of references in reports of the Japanese Geological Survey.

Other Ocean Mining Activities.—As part of its major program of academic research in marine geology, the U.S.S.R. did considerable work concerning deepsea nodule deposits in the Pacific Ocean, but no specific attention was given to the deposits in relation to commercial development. The Geological Survey of India conducted offshore surveys to locate deposits of manganese nodules in the Indian Ocean and announced plans for the design and construction of an offshore research vessel. Mainland China was also reportedly investigating manganese nodule resources in the Pacific Ocean.

The 60-square-kilometer Atlantis II Deep basin area of the Red Sea metalliferous mud deposits was the site of successful pilot mining test in 1979. Orestein and Koppel AG, working under contract to Preussag AG, developed the mining system, which consists of a specially designed vibrating suction sieve coupled to a series of hydraulic pumps. The work was funded by the Saudi-Sudanese Commission for the Development of Red Sea Resources. Shallow tests were conducted in Luebeck Bay in the North Sea and the River Trave, and deep tests, in the Mediterranean Sea prior to the system's deployment at the Atlantis II Deep aboard the *Sedco 445*. About 3,500 cubic meters of material was lifted and stored.

A pilot plant was to be built at Yanbu, Saudi Arabia, to analyze the samples. Preussag also was reportedly working on the development of a processing technique. A patent was assigned to Fried. Krupp GmbH for the extraction of copper and zinc from the Red Sea muds.

Offshore Activities.—Sand mining in Japan was the most extensive offshore activity. About one-fifth of all sand and gravel mined in Japan was by offshore dredging, typically at least 2 kilometers from shore, in water at least 20 meters deep. Deep suction sand dredges were developed in 1978 which operated to maximum depths up to 80 meters.

The other major offshore sand mining area was northern Europe where 10 nations were either engaged in mining in 1978-79 or planning to mine. The main producers were the United Kingdom, Sweden, and France. The United Kingdom recovered well over 10% of its 1978-79 aggregates by marine mining. Typically, a dredge worked at least 5 kilometers from shore in 18-24 meters of water.

In the United States, the main public concern for offshore dredging of sand and gravel was the potential harm to the marine environment. In addition, there was concern about shoreside stockpiling and processing facilities and the possible use of offshore sand and gravel to fill in wetlands.

In areas such as Los Angeles and the Virgin Islands, accelerating costs of onshore aggregate material suggested that use of offshore material would be required. The Virgin Islands Sand Mining Project was set up by the Territorial Government to investigate the potential for offshore sand and gravel. Deposits were investigated off California because of political and environmental limitations on mining of land deposits of saleable aggregates; however, possible mining of these deposits aroused some environmental concerns.

Sand and gravel deposits were discovered off Poland of sufficient size to be exploited at a rate of about 3 million tons per year for several years, although the extent of the deposits was not fully assessed. Deposits of heavy minerals such as zircon and magnetite and of silica sands suitable for use in glassmaking were also indicated.

Exploration for alluvial tin was generally confined to a 2,900 kilometer long granite belt that runs from northern Burma southward through peninsular Burma and Thailand, to west Malaysia and the Indonesian Islands. The Thailand Offshore Mining Organization awarded mining licenses for dredging of cassiterite from deposits in the Andaman Sea. The Thailand Government reduced royalities for tin production so that overall charges were reduced from 33.17% to 28.4% of gross proceeds. As many as 500 small-scale illegal dredging operations had begun to deplete the thin deposits.

Tin was mined offshore of Indonesia by dredging to depths of 40-50 meters. Up to 60% of Indonesian tin was from offshore.

Offshore prospecting for tin was carried out in the Lumut area of Malaysia previous to commencing dredging operations.

Uranium was discovered in the sediments of the Black Sea offshore of Turkey. As much as 7 million tons of U_3O_8 may be contained in the deposits covering 259,000 square kilometers at depths from 1,070 to 2,135 meters. Deposits were fine-grained and nonconsolidated, and mining by suction dredge appeared possible.

Offshore sampling was conducted of the terrigenous sediments at the mouth of the Matepono River off the north coast of Guadalcanal. The only gold-bearing samples were located at the present and former mouths of the river. Gold content ranged from 0.045 to 0.087 part per million.

The Mineral Industry of Afghanistan

By E. Shekarchi[1]

The status of Afghanistan's mineral industry remained unchanged from 1977 to 1978 and declined considerably during 1979. In April 1978, the People's Democratic Party of Afghanistan overthrew the Daoud government and mounted a revolutionary program aimed at strengthening the public sector of the economy with scientific planning. The 5-Year Plan (1979-84) for the economic development of the country was formulated, and considerable emphasis was laid upon the production of coal and minerals. To implement this plan, the authorities at the time allocated[2] $58 million to the budget. Apparently, mineral production for 1978 was carried forward by the momentum of the previous year. However, during 1979, because two more civil disturbances in the country resulted in two new governments and owing to the entrance of the Soviet Union's army into the country, the mineral industry not only failed to perform up to expectations of the 5-year plan, but also lagged considerably behind performances of 1978. The only mineral production not affected by all these events was natural gas output of which more than 90% was exported to U.S.S.R. By the end of 1979, the U.S.S.R. and other East European countries were prepared to be generous in aid during the 5-year plan, but with the U.S.S.R. army present in the country and the unstable political situation, it was very doubtful that normal economic life in 1980 would be possible. Therefore, the Ainak copper deposits, Hajigak iron deposits, and the development plans for any marble, coal, chromite and uranium remained untouched. Some lapis lazuli found its way into the international market in 1978, but in 1979 no exports were reported. The remittances of Afghan workers ($100 million in 1977), practically dried up during 1978-1979 because Iran had a government change and economic difficulties of its own. To remedy the economic ills, Afghanistan requested that various countries forgive or reschedule its debts, after apparently losing its request on a United Nations resolution "urging debt relief for least developed countries." Nearly two-thirds of Afghanistan's debts were owed to the U.S.S.R. By the end of 1979, the countries that reportedly agreed to forgive Afghanistan's debts included Great Britain, Canada, Sweden, West Germany, and Japan.

The Mineral Industry of Albania

By Walter G. Steblez[1]

In 1978-79 Albania witnessed a watershed period in the development of its economy and mineral industry. During the summer of 1978, Mainland China, which accounted for 35% to 40% of Albania's foreign trade, withdrew its long-standing economic and technical assistance, thereby causing major dislocations in many construction projects, including those related to mining and metallurgy.

Despite these difficulties, however, Albania was able to foresee the possibility of such a rift, and was able to secure sufficient supplies of raw materials, spare parts, and other products not met by domestic production on the basis of 1978 exports and past state measures taken to accumulate material and currency reserves. Another result of the breakoff of economic ties with China was a restatement of a policy of total political nonalignment as well as complete economic self-sufficiency.

With approximately 42% of its estimated 165,000-person industrial labor force involved in the mineral industry, Albania maintained its position as the world's third largest producer of chromite in 1978-79, and, despite the paucity of published statistical data, Albanian sources clearly stress the relative importance of its mining-mineral industry to its planned economy.

Currently, 23 kinds of minerals are being commercially produced, including chromium, copper, ferronickel, pyrite, bitumen and marble, phosphorites, magnesium, quartz, dolomites, kaolin, petroleum, gas, and coal. In the near future, recently discovered reserves of nickel-silicate ores, polymetallic ores, bauxite, asbestos, titanic magnetite ore, among others, will be commercially exploited.

Petro Dode, Chairman of the State Planning Commission, reported that although overall industrial production rose 6% in 1978 over that of 1977, the output of chrome and copper ores, coal, chemical fertilizers, ferrous metallurgy products, electric power, machinery, and other durables increased from 7% to 20%. This trend was maintained in 1979 with an 8% increase of industrial output over the 1978 level at a 97.5% plan fulfillment. Reportedly, national income rose 14% during that year. Other centrally planned economic indicators for this period are as follows: Revenues to the State Budget, the main source for financing the national economy, increased 6.4% and 11.6% in 1978 and 1979, respectively, over those of the preceding years; and capital investment for the development of industry, mining, geology, agriculture, transportation, etc., was set at 4.766 billion leks in 1979, following a 90.7% planned expenditure fulfillment in 1978. In 1978, planned investment was set at 18% over that of the preceding year; in 1979, at 12% over that of 1978.

In 1978, a new Guri-i-Kuq ferronickel mine and beneficiation plant, additional facilities at the Steel of the Party metallurgical complex at Elbasan, and the Valias coal mine were put onstream. Other completed projects included the addition of two turbines at the Light of the Party hydroelectric plant, the completion of the Fierzë hydroelectric plant, and an estimated 20,000-barrel-per-day petroleum refinery in Ballësh. Also, in 1978, official sources report the discovery of new petroleum and gas deposits.

Plans for the continued expansion of existing industrial enterprises as well as for the construction of new ones were officially adopted in 1978, among which were (1) facility expansion of the chrome beneficiation plant in Belqizë, (2) a new copper beneficiation plant in Pukë, (3) expansion and modernization of the existing cement industry including the production of white cement, and (4) control automation of the Drin Cascade hydroelectric plant.

Reportedly, in 1979 the growth rate of industrial output exceeded each of the preceding years in the sixth 5-year plan. During the same year, a number of important projects were completed and put into operation: A ferrochrome plant in Burrel, a chrome-ore beneficiation plant in Kalimash, and a copper-smelting plant in Laç. The expansion of capacity was achieved at the Steel of the Party metallurgical complex with the addition of the first iron concentrate production line and at the Light of the Party hydroelectric powerplant with the addition of a third turbine. Also of note was the discovery of new chrome, copper, ferronickel, coal, petroleum, and gas deposits in 1979, the reported completion of Albania's first petroleum deep-drilling rig prepared by a Stalin city machine building plant, and the first 1,500-meter hydraulic probe for geological drillings.

Apart from the achievements and growth in the Albanian mineral industry, many industrial shortcomings and enterprise plan fulfillment failures were reported. In 1978 and 1979, difficulties were cited in a number of enterprises of the coal, petroleum, cement, and other industries, where set tasks of the production plan were not met.[2] Among the reasons given by official sources were mismanagement, poor labor and heavy-equipment utilization, failure due to inadequate use of transport equipment, low mechanization, and a high degree of labor-intensive operations at many enterprises.[3] For example, although 1978-79 marked the beginning and expansion of machinery and equipment production needed for mechanizing mining operations, at enterprises like Tirana's Dinamo plant there appears to be a shortage of spare parts causing stoppages and delays in output.[4]

The level of mechanization at many mining enterprises can be described as uneven, at best. It is reported that the Manzë coal mine in Durrës has increased labor productivity with emphasis given to the mechanized transport of coal both inside and outside the mine; however, at other enterprises such as the Alarup coal mine, only 38% of the loading process is mechanized.[5] Underutilization of transport equipment and losses of coal during transportation in the Tirana District, where approximately 33% of Albanian coal is extracted, is also reported, and the Ministry of Industry and Mining has been urged to utilize all available cable cars to transport minerals, timber, and other materials.

Other difficulties are admitted at the Steel of the Party metallurgical complex at Elbasan and in the petroleum industry. In the former case, apart from poor work and low productivity, serious shortages of domestic coal and dolomite from the Korçë and Selenicë mines were reported to be due to transportation mismanagement. For the first 9-month period of 1979, this represented a deficit of 20,838 tons of coal from the Korcë Mine and 6,460 tons of dolomite from the Selenicë Mine.[6] In the latter case, poor labor organization is cited as a problem at the new Ballësh petroleum refinery.

The petroleum industry, in general, has been singled out as not having met its planned rate of drilling for 1978. Lack of technical organization accounted for 50% of the work stoppages, and 40% of the prospecting and drilling flaws was a result of incompetent drilling-rig installation owing to inadequate training of technical field personnel, as well as an inadequate educational program in geophysics and geology.[7]

In 1978, the freight transportation plan (10 ton-kilometers) was fulfilled 99.5% with a 6% increase above that of 1977 and, in 1979, the planned increment was set at 7% over the 1978 level. Significantly, the Prrenjas-Guri-i-Kuq railroad, linking two ferronickel-ore-extracting areas, became operational in 1979, and the construction of the Laç-Shkodër railroad, linking two copper-producing areas, commenced during the same year. Also, in 1978, as part of the construction of the port of Durrës, unofficial sources report the construction of a mineral storage facility.

The 1980 plan envisages a 10.2% increase of industrial output, a 7.6% rise in capital investment, including an 8.5% increase in construction-assembly work over that of the preceding year. The plan calls for the further development of chrome ore and concentrate, ferrochrome, ferronickel, copper and copper manufactures, phosphorites, quartz, and other minerals facilities. This is to be accompanied by the completion and commissioning of new mines and the expansion of existing ones.

Capital construction for 1980 will include the construction of beneficiation plants for chrome (Belqizë) and copper (Korçë and Pukë Districts). In 1980, 23% of the chrome and 62% of the copper ore mined in Albania is scheduled for domestic beneficiation.

Other projects include the addition of a second blast furnace, a second coke battery, and a refractory brick plant at the Steel of the Party metallurgical complex, as well as a fourth turbine generator at the Light of the Party hydroelectric plant. In order to ameliorate the deficit of spare parts, the 1980 plan calls for the output of no less than 95% of the spare parts required by industry. In 1980, the energy sector—petroleum, gas, coal and electric power—planned to increase 25% over that of 1979.

Preliminary results show unsatisfactory progress in several areas of mineral extracting in 1980, with production schedule lags at the Valias, Alarup, and Memaliaj coal mines, the Belqizë, Batër, and Kalimash chrome mine, and the Spack, Tuc, and Gjegjan copper mines.

PRODUCTION

Albania publishes little in the way of consistent statistics. Most production data is presented as a percentage of growth of output over that of preceding years, or as a percentage of total industrial output, thereby necessitating estimates of annual commodity output.

According to the latest available figures, in 1978 the mineral and related industries are weighed proportionally as a percentage of total industrial output as follows: Machine-building, 12.2%; construction materials industry, 7.9%; copper, 4.2%; electric power, 3.8%; ferronickel, 1.6%; coal, 1.2%; chrome, 1.2%; and the bitumen industry, 0.1%. In 1978, compared with 1960 (base year), key industries such as copper increased production 24 times, chrome 3.5 times, coal 4 times, machine building and electric power 19 and 10.5 times, respectively.[8]

The estimated production of chromite, copper, and nickel for 1978 and 1979 shows marked increase over their respective preceding years. Iron and steel output remained about the same from 1976 through 1977, with an increase only in 1979.

All the nonmetallic minerals except nitrogen, whose output appears to be constant, and mineral fuels show increases during this period.

Table 1.—Albania: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
Asphalt and bitumen, natural[e 2] thousand tons	1,350	1,500	1,600	1,650
Cement, hydraulic do	700	750	900	1,000
Chromium: Chromite, gross weight do	830,000	880,000	990,000	1,110,000

Table 1.—Albania: Production of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
Salt[e]	50,000	50,000	50,000	62,500
Sodium compounds, n.e.s.: Sodium carbonate, calcined (soda ash)[e]	21,000	23,000	25,000	32,500

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, a variety of crude construction materials (common clay, sand and gravel, and stone) is undoubtedly produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels. Also, metallic nickel production reportedly began in 1978, but data on the level of production are not available.

[2]Includes petroleum refinery-produced asphalt and bitumen.

[3]Separate data on marketable production are not available, but gross and marketed output are regarded as nearly equal.

[4]Based on estimated tonnages reported in: United Nations. World Energy Supplies 1972-76. Statistical Papers, ser. J, No. 21, New York, 1978, 233 pp.

[5]Sums of listed products only; no estimates have been made for other products produced.

TRADE

Albania's foreign commercial policy, predicated upon a domestic and foreign policy of self-sufficiency and total nonalignment, forbids foreign credit borrowing, joint industrial ventures, mixed enterprises, and similar routine international business transactions; it stipulates trade on the basis of import-export only.

Prior to the complete break of trade relations with China in 1978, Albania's principal partner in dollar trade was Yugoslavia, followed by Italy, the Federal Republic of Germany, Greece, Austria, and France. In ruble trade with the planned economy Council of Economic Mutual Assistance (CMEA) countries, Albania's principal trade partner was Czechoslovakia, followed by Romania, the German Democratic Republic, Poland, Hungary, and Belgium.[9]

Since that period, Yugoslavia became Albania's chief trade partner with an approximate $56 million trade turnover in 1979. The rest of the foreign trade slack was taken up by the aforementioned countries.

Yugoslav imports included chromite, bitumen, diesel fuel, chemicals, cement, electric power, and consumer goods. Albania imports metal products, pharmaceuticals, chemicals, refractory materials, and consumer and producer durables from Yugoslavia. Two noteworthy agreements were signed for 1980 with Yugoslavia: A $5,600,000 import-export deal, between Inter-Impeks-Prometi of Skopje and Mineral-Impeksi of Tirana, covering an exchange of mineral commodities (mostly chrome from Albania and a number of metal products from Yugoslavia); and a Yugoslav purchase of 850,000,000 kilowatt-hours of electric energy, which will be transmitted over a 220-kilovolt line that will be built between Fierzë and Kosovo.

Reportedly, Albania plans to increase its exports in 1980 32% over the 1979 level in order to sustain needed purchases of capital equipment and new technology. In 1979, the most important exports were chrome ore, ferronickel ore, petroleum products, coal, and electric power; good export results of blister copper and urea were also achieved that year. In 1980, the export of these commodities is to be expanded together with the export of new products: Cathodic copper, ferrochrome, plastics, etc. Furthermore, the 1980 plan calls for more than 65% of volume of exports to be domestically processed, including 60% of the coal, 23% of the chrome, and approximately 62% of the copper ore.

Albanian chromite, a principal export commodity, is marketed as both a concentrate containing 51% Cr_20_3 and as ore with a 38% to 42% Cr_20_3 content. In 1979, Albanian chomite was exported to the German Democratic Republic, Romania, and Poland among the CMEA countries and Yugoslavia; Italy and the United States were among the major importers in the West. The U.S. share of chromite imports amounted to $5,787,178 in 1979; whereas, Albania's main mineral import from the United States during the same year was low-volatile bituminous coal worth $1,196,964.

Albania signed a trade agreement with Romania in July 1979 reportedly to supply Romania with asphalt, petroleum, chrome ore and concentrate, copper and copper products, pyrite concentrate in exchange for machine tools, oilfield equipment, spare parts, chemicals, bearings, etc. A trade agreement was reached that year with the German Democratic Republic calling for Albanian exports of chromite, copper tubes, agricultural and consumer durables in exchange for producer durables, scientific instruments, chemical products, and potash fertilizers. Likewise, an agreement concluded with Turkey in 1979 includes Albanian shipments of petroleum, diesel fuel, urea, sulfuric acid, glycerine, copper, and copper wire in exchange for transport equipment, pump and compressor pipes, aluminum, and cables.

Table 2.—Albania: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum metal including alloys, unwrought	121	40	All to Italy.

COMMODITY REVIEW

METALS

Chromite.—Albania's estimated 21.5 million tons of chromite reserves is situated in four main deposits in the eastern regions of the country near the Yugoslav border. The deposits are podiform whose chromium content is estimated to range from tens of thousands to hundreds of thousands of tons of chromium content, with an estimated average 43% Cr_2O_3 content.

The main chromite-producing deposits are in the Tropojë-Kukës area in the northeastern part of the country, containing the Kukës, Krumë, Kalimash, Kam, Tropojë, and Qafa-e-Prushit Mines; the Batër-Martanesh area, in central Albania with the Belqizë, Batër, Klos, Lugu-i-Gjote, and Todo Manco Mines; the Pogradec-Lake Ohrid area, also in central Albania, with the Memelisht, Zergjan, and Pogradec Mines; and the Korcë area, in the south, with the Kruste Mine.

In 1978, Albania reported the discovery of new chrome ore deposits but provided no details regarding location or size of deposits.

Generally, Albania is reported to have exceeded its chrome ore output plans for 1978 and 1979. However, project delays were noted at shafts 3 and 5 at the Belqizë Mine and shaft 6 at the Batër Mine; poor labor organization was given as the reason.

In 1979, it was reported that a chrome ore sorting plant was put into operation in the Batër Mine area and that the construction of sorting plants at Thekë and Shkallë and Belqizë is continuing. Currently, these plants sort 80% of Albania's exported chromite.

Most of Albania's chrome is exported. A small amount is consumed by the domestic refractory industry; however, the largest amount of the mineral, domestically consumed, is used in ferrochrome production. The increase of domestic ferrochrome production capacity with the addition of new plants, such as the one in Burrel, will set aside an estimated 250,000 tons of chromite in 1980 for domestic consumption.

Copper.—Approximately half of Albania's estimated 50-million-ton copper reserves (low-grade sulfide) are located in the Midrite District; the rest are in the Krujë, Kukës, Pukë, and Shkoder areas in the northern part of the country. In 1978, the construction of a new beneficiation plant was reported in Pukë and, in 1979, a small copper-smelting plant in Laç became operational.

Despite estimated increases in the production of ore, blister copper, and semimanufactures in 1978 and 1979, Albania reported decreases in the quality of ore output. The quantity output for January-May 1979 exceeded the plan by 102%; whereas, the planned quality of output was met only 90%, thus raising transportation and blister-processing costs by several million leks.[10] Mine losses of ore of up to 2% and a 7%-above-plan increase in the ore dilution was reported at the Gjergjan Mine in 1978. Similar situations were reported in the Spac, Kurbnesh, Thirra, Derven, and Shmia copper mines.[11]

Reportedly, the Thirra Mine also suffered losses, both in quality and quantity of ore, due to the buildup of large stocks that was caused, in part, by inadequate transportation.

Nickeliferous Iron Ore.—Most of Albania's nickeliferous iron ore is found in deposits in the east-central part of the country. The principal mines are Prrenjas, Cervenake, and Guri-i-Kuq, in the Pogradec area, and Pishkash in Librazhd. Other mines are situated in the Kukës and Dibrë areas at Mamëz and Bushtricë. Reserves are estimated at 20 million tons with an ore content of 15% iron, 1% nickel, and 0.06% cobalt.

Nickel and cobalt are produced as byproducts of iron ore mining in the Librazhd and Pogradec areas, which are reported to contain an estimated 200,000-ton reserve of nickel and a 12,000-ton reserve of cobalt. Reportedly, 36,000 tons of nickel will be produced in 1980.[12]

In 1978, a new Guri-i-Kuq Mine became operational and, the following year, the discovery of new ferronickel deposits were reported. Also in 1978, Albanian authorities reported significant, though unspecified, losses of ore as well as ore dilution at the Prrenjas Mine.

Iron and Steel.—The 1978-79 period witnessed the startup and expansion of the 800,000-ton-per-year designed-capacity steel complex at Elbasan. In 1979, the Prrenjas-Guri-i-Kuq railroad was commissioned, linking the Elbasan complex with two major ore-producing areas. Currently, Albania is exporting some of its iron and steel output to Italy, Spain, and the Philippines.

NONMETALS

Cement.—Albanian cement plants are located along the western part of the country at Elbasan, Fushe-Krujë, Shkodër, Tirana, and Vlorë. Although, a net exporter of cement, Albanian industry often complains of plan nonfulfillments due to a lack of regular supplies of this commodity. Reportedly, in 1980, the output of cement is planned at 1,000,000 tons.

Fertilizer Materials.—Albania is a net importer of raw materials for fertilizer production. Phosphate is imported from North Africa, potash from Italy, and nitrogenous material and ammonia from the Federal Republic of Germany. However, recently phosphorite deposits were found in Gjirokastër, Tepelenë, and Sarande. The production of phosphatic fertilizers at Laç, in Krujë, is in the form of granulated and powdered superphosphate material. Nitrogenous fertilizer is produced at the 50,000-ton-per-year Fier ammonia plant. Urea is also produced in Fier.

The Albanian chemical industry produces sulfuric acid (in Krujë) as well as caustic and calcine soda.

MINERAL FUELS

In 1978 and 1979, Albania maintained its self-sufficiency in all forms of energy, as well as its position as a net exporter of most hydrocarbon fuels and electric power.

In comparison with 1977, the total production of primary energy in 1978 and 1979 increased 7% and 8%, respectively. Also, marked increases occurred during this period in the output of lignite, petroleum, and electric power. Exports of several petroleum products, however, dropped significantly compared with the 1977 level.

Table 4.—Albania: Estimated total primary energy balance for 1978 and and 1979[1]

(Million tons of standard coal equivalent[2])

Year	Total primary energy	Coal (lignite, anthracite, bituminous, and coke)	Crude oil and petroleum products	Natural and associated gas	Hydropower
1978:					
Production	4.49	0.84	2.94	0.47	0.24
Imports	.12	.12	--	--	--
Exports	.24	.01	.17	--	.06
Apparent consumption	4.37	.95	2.77	.47	.18
1979:					
Production	4.96	.98	3.23	.49	.26
Imports	.12	.12	--	--	--
Exports	.27	.01	.19	--	.07
Apparent consumption	4.81	1.09	3.04	.49	.19

[1]Estimates based on data from various Albania sources.
[2]1 ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are: Lignite, 0.7; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric power, 0.125 (per 1,000 kilowatt-hours).

Source: United Nations. World Energy Supplies. Statistical papers, Series J, No. 18, 1975.

Hydroelectric power output continued to increase steadily during 1978 and 1979 with the startup of the Fier powerplant and the expansion of generating capacity at the Light of the Party plant. Consumption of all forms of energy during this period increased substantially, matching Albania's accelerated effort to industrialize its economy.

Coal.—Albanian lignite deposits are located in four main areas of the country: Near Durrës, in the central coastal area; near Krrabë, in the central part of the country; in the south at Memaliaj; and in the southwest in the Korcë area.

In 1978 and 1979, lignite production represented approximately 18% of Albanian total primary energy output. During this period, the Valias Mine became operational, and the Manzë Mine near Durrës was reported to have increased its capacity and efficiency.

Petroleum.—Albania's petroleum output increased slightly in 1978 and substantially over the 1978 level in 1979. Although new but unspecified reserves were reported in 1979, Albania's main known oilfields are located in the southeastern part of the country in the Patos, Marineze, and Stalin areas.

The startup in 1978 of the 1-million-ton-per-year Ballësh refinery near the Patos oilfield and Albania's additional 1-million-ton-per-year refining capacity and reserves should be sufficient for domestic consumption and export in the 1980's.

Natural Gas.—As with crude oil, new but unspecified gas deposits were discovered in Albania in 1979, adding to reserves estimated at 8 billion cubic feet.

Most of Albania's gas deposits, as with petroleum, are found in the Lushnje and Fier areas. Albanian natural gas is consumed domestically by the chemical and petrochemical sectors of the economy as well as by thermal-power-generating plants.

The Mineral Industry of Algeria

By David E. Morse[1]

Algeria was one of Africa's largest producers of crude petroleum, natural gas, cement, marble, and barite in 1978 and 1979 and was the only producer of primary mercury on the continent. Production of zinc, lead and copper concentrates, iron ore, phosphate rock, clay minerals, gypsum, and salt was modest by world standards. The State-owned Société Nationale de Recherches et d'Exploitations Minieres (SONAREM) controlled mineral exploration, production, processing, and marketing in Algeria. Exploration for and exploitation of liquid and gaseous hydrocarbons in Algeria was dominated by the State-owned Société Nationale pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocabures (SONATRACH). Natural gas was marketed and distributed to domestic consumers by Société Nationale Algerienne de Electricité et du Gaz (SONELGAZ).

The Algerian economy continued to expand in both 1978 and 1979; there was an overall growth in the gross domestic product (GDP) of approximately 9% in both 1978 and 1979 in constant 1974 prices. Algeria's 1978 GDP, in terms of then-current prices, was $21.8 billion;[2] in 1979, the GDP rose to an estimated $27.1 billion in 1979. The hydrocarbon sector continued to be the backbone of the Algerian economy and the largest contributor to Government revenues in 1978 and 1979.

Recent development plans have placed emphasis on the development of hydrocarbons and heavy industry. With 40% to 50% of the GDP earmarked for investment each year, over 250 factories were opened and 150 infrastructural projects were completed in the 1970-77 period. As a result, many basic industries were brought online, making Algeria almost self-sufficient in fertilizers, cement, chemicals, iron and steel, and plastics. However, most industries established so far have been capital intensive rather than labor intensive; consequently, unemployment and underemployment have become serious problems for unskilled workers. Coincidentally, a chronic shortage of skilled manpower has been responsible for underutilization of the country's industrial capacity. A rapid population growth of over 3% per year in the decade of the 1970's raised domestic consumption and has placed a severe strain on Algeria's neglected agriculture, housing, and services sectors.

Algeria's second 5-year development plan ended in 1977, and 1978 was declared a year of consolidation, with emphasis placed on the completion of many planned projects. However, the President's deteriorating health and subsequent death in December 1978 delayed promulgation of the third development plan. When the new plan was made known, it was announced that it would cover the 1980-84 period.

Government investment levels remained high in both 1978 and 1979, but the 1979 development budget emphasized education, community development and urban modernization, housing, and water projects. Allotments for industrialization continued at a fairly high level, with important investments in the cement, fertilizer, iron and steel, and nonferrous metals industries. SONATRACH was investing in new petroleum refineries, liquified natural gas (LNG) plants, natural gas processing and reinjection facilities, natural gas and crude oil pipelines, and new oil and gas production wells, and was also conducting a moderately extensive exploration program. SONAREM was conducting exploration programs in the remote Hoggar mountains in southern Algeria and in the high plateau region as well.

PRODUCTION AND TRADE

Algerian mineral production has remained fairly stable for several years, but output has declined in some areas as exploration and development have failed to keep pace with the exhaustion of some mines. Crude petroleum production in 1978 and 1979 was fairly constant, but natural gas and natural gas liquids output increased substantially. Cement output increased markedly as new cement plants were brought online in both 1978 and 1979. Barite production recovered from the low level of 1977, but lead-zinc output remained depressed, and iron ore production did not meet SONAREM's projected levels owing to poor world market conditions. Mining and quarrying contributed less than 1% to the GDP in both 1978 and 1979, whereas the contribution to the GDP from the hydrocarbon sector was about 28% in 1978 and nearly 31% in 1979.

Algeria exported significant quantities of crude petroleum, petroleum products, LNG, iron ore, mercury, and phosphate rock in 1978 and 1979. Minor quantities of lead and copper concentrates were also exported. The United States imported 233.8 million barrels of Algerian crude oil in 1978 and 217.8 million barrels in 1979. This oil represented over 50% of all Algerian output and 10.2% of all U.S. crude imports in 1978 and 9.35% of U.S. crude imports in 1979. The U.S. imported 63 billion cubic feet of natural gas from Algeria in 1978 and nearly 264 billion cubic feet in 1979. Although Algerian crude oil exports declined by 2.8% in 1979, compared with 1978, the average value of these exports in 1979 increased by 49%; and by yearend 1979, their f.o.b. value was more than double the 1978 average of $14.12 per barrel.

The value of exported crude oil, refined petroleum products, and LNG was $6.2 billion in 1978 and nearly $8.2 billion in 1979, or nearly 92% of the value of Algeria's total exports in both years. Nonhydrocarbon mineral exports were valued at an estimated $45 million in 1978 and $47 million in 1979.

COMMODITY REVIEW

METALS

Aluminum.—Algeria planned to bring its first aluminum smelter online in 1982 at Msalla in the Setif district of north-central Algeria. The 125,000-ton-per-year facility was expected to be built with financial and technical assistance provided by the U.S.S.R. Plans called for the importation of alumina for the smelter from Jamaica. In February 1979, SONALGAZ awarded a $150 million contract to Thomassen Holland B. V. of the Netherlands for a 550-megawatt gas-turbine electric power plant that was expected to furnish electricity for the aluminum smelter. The first units of the powerplant were scheduled to come online in 1981 with final completion scheduled for 1983.

Bauxite.—SONAREM retained Geomines Geological and Mining Engineering Corp. of Hungary to explore for bauxite in northern Algeria. No details of the $100,000 contract were disclosed.

Iron Ore.—Most of Algeria's 1978 and 1979 iron ore output came from the Oenza and Boukhadra operations in eastern Algeria. Domestic demand for iron ore was 900,000 tons per year, and the remainder of the production was exported to markets in Europe.

The Gara Djebilet iron ore deposits in

western Algeria have been studied extensively, and SONAREM, in conjunction with Société Nationale de Siderurgie (SNS), planned to begin exploitation of the 1-billion-ton deposits by 1985. An engineering study was begun in 1978 for a 1,500-kilometer railway from the Gara Djebilet deposits to La Macta near Oran on the Mediterranean Sea, where SNS planned to build a 10-million-ton-per-year fully integrated steel complex based on domestic ores. Bechtel Inc. of the United States was awarded a $33.5 million contract in 1978 for a 3-year study covering all phases of the project other than design of the steelworks. In 1979, Tiajpromexport of the U.S.S.R. received an $8.7 million contract for a feasibility study on development of the Gara Djebilet iron ore deposits.

Iron and Steel.—The expansion of the El Hadjar steel mill continued in 1978 and 1979, with the objective being to increase the mill's capacity from 450,000 tons per year of raw steel to 2 million tons per year. New facilities included a 2,000-cubic-meter blast furnace, a $54 million bank of coke ovens, three 85-ton Linz-Donawitz (LD) converters, two single-strand continuous casters, and a rod wire mill. The mill's hot-rolling capacity was projected at 1.3 million tons per year after the expansion, and its cold-rolling capacity was projected at 700,000 tons per year. The investment for the project, excluding the coke ovens, was $500 million. Japan's Kawasaki Heavy Industries, Ltd., C. Itoh & Co., and West Germany's Demag A.G. were scheduled to complete the expansion by 1983.

SNS planned to build a new iron and steel production facility at Jijel, 12 kilometers east of Djidjelli on the Mediterranean coast, in 1984. The project plans included facilities for production of 1.2 million tons per year of sponge iron using direct-reduction electric steelmaking furnaces with continuous casters capable of producing 800,000 tons per year of steel billets and a 110,000-ton-per-year ferroalloys plant. It was anticipated that domestic natural gas would be used as the reductant. Construction of a new power station to supply electricity for the mill was also planned; and construction of a new port, road and rail connections, and a town for the mill's employees was also required.

Manganese.—SONAREM continued to investigate manganese deposits at Guethara in western Algeria in 1978 and 1979. The deposits were expected to be exploited to produce 10,000 to 12,000 tons per year of manganese ore for use by the domestic steel industry.

Other Metals.—SONAREM continued to assess the mineral potential of the Ahaggar massif and the Hoggar mountains in the remote desert regions of southern Algeria. Deposits slated for development were gold at Tirhirine, uranium at Tingouine and Abankor, and tungsten at Laouni.

NONMETALS

Cement.—Algeria's State-owned construction materials cooperation, Société Nationale des Matériaux de Construction (SNMC), was in the midst of an expansion program that aimed to increase the Nation's annual cement capacity to over 10 million tons. Three cement plants were completed in 1978, a 1-million-ton-per-year plant at Ain-El-Mebira, a 1-million-ton-per-year plant at Beni Saf, and a 500,000-ton-per-year plant at Saida. In 1979, two plants were projected to be completed, one at Hamma Boziane and one at El Asnam. Three cement plants were scheduled to be commissioned in 1980, a 1-million-ton-per-year plant at Bouira, a 500,000-ton-per-year plant at Batma, and a 500,000-ton-per-year plant at Djelfa. In 1979, SNMC awarded two contracts valued at approximately $240 million each for the construction of two plants. Two Japanese firms, Marubeni Corp. and Kawasaki Heavy Industries, Ltd., were retained to build a 1-million-ton-per-year cement works at Tebessa; and F. L. Smidth-France and F. L. Smidth-Denmark were contracted to construct a 1-million-ton-per-year facility on a turnkey basis at Sour-El-Ghozlane in the Bouira governate, 100 kilometers south of Algiers.

Fertilizer Materials.—Nitrogenous.—In 1978, SONATRACH awarded a $50 million contract to Techniq and Creusot Loire Enterprises of France to modernize and expand output from the Arzew fertilizer plant. The French companies were also contracted to provide technical assistance to increase the operating efficiency of the plant's four production units. Output from the Arzew plant, which was completed in 1970, has not even come close to the design capacity of 330,000 tons per year ammonia, 130,000 tons per year urea, 165,000 tons per year ammonium nitrate, and 132,000 tons per year nitric acid. An expansion program was also underway at the Arzew fertilizer facility to increase ammonia capacity by 300,000 tons per year and ammonium nitrate capacity by 330,000 tons per year. At SONA-

TRACH's Annaba fertilizer complex, construction of new units to produce 300,000 tons per year of ammonia, 330,000 tons per year of ammonium nitrate, and 195,000 tons per year of nitric acid was also underway.

Phosphatic.—In January 1979, two Japanese firms, Marubeni Corp. and Hitachi Shipbuilding and Engineering Co., and the Polish State company, Polimex-Cekop, were contracted by SONATRACH to build two phosphate fertilizer complexes in Algeria. The contract was for the expansion of facilities at Annaba and a new plant at Tebessa. Under the contract, a 528,000-ton-per-year sulfuric acid plant and a 500-ton-per-day phosphoric acid plant were to be built at each location. Additionally, Annaba was scheduled to receive units for the production of 231,000 tons per year of diammonium phosphate and 198,000 tons per year of ammonium phosphate. Other units, scheduled to be built at the Tebessa complex, included a 280,000-ton-per-year triple superphosphate plant and a 5,000-ton-per-year aluminum fluoride facility. Plans were for sulfur to be imported and domestic phosphate rock from Djebel Onk to be supplied by SONAREM.

MINERAL FUELS

Natural Gas.—SONATRACH was in the early stages of a massive expansion program to develop the full spectrum of facilities required to produce 3.88 trillion cubic feet per year of natural gas and 250 million barrels per year of natural gas liquids. In 1978, Algerian LNG capacity increased to 600 billion cubic feet (17 billion cubic meters) with the completion of LNG-1 at Bettioua near Arzew and Train 4 at Skikda-1. LNG-2, adjacent to Liquefaction Plant LNG-1, was scheduled to come online in 1980 and was expected to produce 370 billion cubic feet per year (10.5 billion cubic meters) of LNG, 300,000 tons per year of butane, 350,000 tons per year of propane, and was also expected to have helium production capabilities. Trains 5 and 6 at Skikda-1 were also scheduled to come online in 1980 and were expected to bring the capacity of Skikda-1 to 304 billion cubic feet (8.6 billion cubic meters) per year. Contracts for major components and engineering services for LNG-3 at Arzew were awarded by SONATRACH in 1978 and 1979. LNG-3 was scheduled to come online in 1982 and was expected to process 556 billion cubic feet (15.75 billion cubic meters) per year for LNG production and produce 500,000 tons per year of propane and 450,000 tons per year of butane.

Additionally, pipelines from the prolific Hassi R'Mel field to Skikda and Arzew were being built, and construction of the Trans-Med-Pipeline to Italy got underway in 1978. Gas processing plants at Hassi R'Mel were completed and others were under construction there. Development contracts for the Alrar and Rhourde Nouss gas fields were signed in 1979.

Algeria had by yearend 1979 negotiated contracts for the annual export of 1.8 trillion cubic feet of natural gas as LNG and 438 billion cubic feet of natural gas through the Trans-Med-Pipeline, with most deliveries scheduled to begin in the 1980-85 period. In 1979, LNG exports were estimated at 441 billion cubic feet, reflecting an increase of nearly 200 billion cubic feet over 1978 exports. Algerian domestic demand for natural gas expanded rapidly in 1978 and 1979, increasing by 21% in 1978 and by an estimated 11% in 1979.

Petroleum.—Crude petroleum production in Algeria was fairly constant in 1978 and 1979, averaging approximately 1.16 million barrels per day. Algerian crude oil output was expected to peak at 1.25 million to 1.3 million barrels per day in the early to mid-1980's and then decline to approximately 850,000 barrels per day by 1990. Crude petroleum exports were projected to decline sharply beginning in 1980, when the new 300,000-barrel-per-day oil refinery at Skikda is scheduled to be placed in service. SONATRACH planned to decrease 1980 crude oil exports by 150,000 barrels per day and 1981 crude oil exports by an additional 150,000 barrels per day. Exports of refined products were expected to increase significantly but then decline as a result of anticipated increases in domestic demand that would absorb the excess in refined output. Two smaller oilfield refineries at In Amenas and Hassi Massaoud were also scheduled to come online in 1980.

The Mineral Industry of Angola

By Janice L. W. Jolly[1]

In 1978, petroleum receipts accounted for about 70% of the Angolan Government revenues. The public enterprise Sociedade National de Combustiveis de Angola (SONANGOL), which was formed in May 1976, continued to supervise all aspects of petroleum and other hydrocarbon exploration, extraction, refining, and distribution. As a result of a new law providing for production sharing and a more favorable attitude towards foreign investment, several new petroleum exploration and production contracts were signed in 1979. Several Western nations were, in general, showing a renewed interest in Angolan minerals. The diamond industry was reorganized, and new expatriate help was recruited in an effort to increase production to prewar levels. Cement was exported for the first time since 1975, and Angolan quartz was finding an expanding market.

The economy was still recovering from the dramatic contraction of activity following the exodus of Portuguese authority in 1975 and the devastation caused by protracted civil war between rival independence movements. Much remained to be accomplished, particularly in respect to renovating and improving vital infrastructure, such as the Benguela railroad, and industries, such as the cement and steel industries. A new foreign investment law was introduced enabling foreign private capital to participate in the economic recovery. The agricultural sector was still the largest employer, but it was the petroleum industry that was providing needed funds for economic recovery. The 1977 gross domestic product (GDP) was estimated at $1.97 billion[2] at current prices;[3] this compares with the 1973 GDP of $1.8 billion. Prior to 1975, crude petroleum and coffee dominated exports, each accounting for roughly 30% of the total; diamonds contributed 10% and iron ore a further 6%. In 1978 and 1979, petroleum accounted for most of the revenues earned and iron ore was not being produced.

The first clear step to bring foreign investors back to Angola was the publication of a new investment law, which covers all aspects of economic activity apart from the oil industry. The law allowed for repatriation of profits, provided guarantees of compensation in case of nationalization, and held out the prospect of exemption from tax and from custom duties. A major provision was that the projects must be framed in terms of the country's national development plan. The Government would retain control over accounts and personnel training programs. Foreign capital may not be invested in certain strategic areas of state control, such as defense, banking, insurance, communications, electricity, and water supply. A normal time scale of 10 to 15 years would be established for investment projects. Both joint (where the Government owns 51%) and wholly owned private enterprises will be allowed.[4]

A new mining law was also approved in May 1979. The law spelled out the following principles: (a) Government ownership of all mineral resources; (b) Government control of geological mapping; (c) Government control of mineral resource evaluation; (d) utilization of mineral resources as required by the planned economy; (e) concession of exploration rights exclusively to Government mining enterprises, with some justifiable exceptions; (f) acceptability of operating contracts with certain approved foreign agencies with technical capacity to develop the extraction industry; and (h) foreign companies were obligated to abide by Angolan law and comply with needs of the Angolan people, but at the same time were allowed the right to investment recovery and profits.[5]

The first Council of the General Directorate of the National Directorate of Geology and the Mining Industry met in August 1979 to make plans for the future. It was resolved to speed the reorganization of the diamond industry, to provide the National Enterprise for Ground Waters (HIDROMINA) with manpower and material for supplying the arid and semiarid regions of the country with water, to strengthen the National Gemstone Enterprise (ROREMINA), and to create favorable conditions for exploitation of ferrous metals. The national companies to exploit quartz and phosphate (the Angola State Phosphates Company) were also discussed, as was the establishment of a professional training center for geological and mining industry workers.[6]

Angola signed a number of economic, aid, and cooperation agreements during 1978 and 1979. These included additional cooperation agreements with the Soviet Union and Cuba. In 1976, Angola became the second African country to participate in the Soviet-led Council for Economic Mutual Assistance (COMECON), and a 23-year agreement was signed to broaden contacts with the U.S.S.R. at all levels. Soviet experts were to undertake research on Angola's mineral resources and were to make a geological map of Angola. Accords were also signed with Yugoslavia, Bulgaria, and Brazil for economic, scientific, and technical cooperation. Economic cooperation with Sweden was to be increased. East Germany made two economic agreements for the supply of German equipment. The European Economic Community was considering reconstruction aid for Angola. An agreement was reached with Romania for $74 million in technical and economic aid. The People's Republic of Congo discussed cooperation with Angola in the petroleum sector, and an agreement was signed in 1979. A special agreement pertaining to sending Cape Verdian workers to Angola was signed in May 1979 during the second session of the Joint Angola-Cape Verde Committee for Economic, Scientific and Technical Cooperation.

Following meetings in Lusaka, Zambia, in early 1979, it was agreed between Zambia, Zaire, and Angola that an effort must be made to reopen and improve the Benguela railroad. Refurbishing the railway was expected to be expensive, requiring about $106 million. The many technical problems included deterioration of the signaling system and maintenance and repair of rolling stock, which had not been used for more than 4 years. Angola was seeking $80 million for her share of a three- phase development plan for the railway. The phase in Angola was to include bridge reconstruction and purchase of 17 mainline locomotives, 10 shunting engines, 900 freight cars, and 26 passenger coaches. About $27 million was promised from several sources for the first phase as a result of talks held in Belgium in June 1979. Of the total, $10.4 million each was to be provided by the European Economic Community (EEC) and the Arab Development Bank, and the rest was to be split between 10 Western nations. Later in the year, promises by Sweden and the Organization of Petroleum Exporting Countries (OPEC) raised the contributions to $35.8 million. Financing for the second stage, costing about $57 million, was to be considered in 1980. Stockholders in the railroad included Angola Government (10%), Chrewe Holdings Ltd. (9%), Darjeeling Developments Ltd. (9%), Everton Enterprises Ltd. (9%), Farnington Trading Ltd. (9%), Rocket Overseas Investment Ltd. (9%), Ticlio Investments Ltd. (9%), Yoxal Investment Ltd. (9%), and the operator, Tanganyika Concessions Ltd. (8.8%).[7]

Although the Benguela railway was operating wiithin Angola during 1978, functioning of the line for international traffic never progressed beyond the formal opening ceremony in November 1978. Dissidents fighting against the present Government interfered until April 1979, when the first train to carry Zairian manganese ore from Sisenge arrived safely in Lobito. Through most of 1979 the line was far from secure. The six to eight major bridges along the railroad were being heavily guarded to ward off attacks.

Other transportation improvements included a new road between Angola and Zambia. Costing about $80 million, the road would provide a short cut from Zambia to Angola's Benguela railroad and port of Lobito. Work began on the road in 1979. Angola's maritime ports were also being renovated. Fourteen cranes were ordered from the German Democratic Republic to equip ports in Luanda, Lobito, and Mocamedes. Experts from the East German company Ebersswalds were to train Angolans to operate and repair the cranes. Work on the new port of Cabinda also began in 1979 and was scheduled to last 2 years. Hidroportes, a national firm, was to be in charge of the construction. The port will have three mooring wharves.

PRODUCTION AND TRADE

Petroleum production increased during 1978 and 1979 as Government policies became more oriented towards mineral development. With renewed prospecting and opening of new wells, petroleum production was expected to double by 1985. Petroleum prices were also escalating as the Angolan Ministry of Petroleum increased the price from $21.04 to $23.23 (fob) per barrel on July 1, 1979. Payment terms were also shortened from 60 to 45 days. By January 1, 1980, the price per barrel of contract oil was $31.70. Diamond production also improved, and by 1979 had nearly doubled as corrective measures were taken to improve the mining environment. Iron ore mining was still not resumed since the mine closure of August 1975. The Empresa Nacional do Cimento do Lobito exported about 9,000 tons of cement to Nigeria in early 1979. This company reportedly produced more than 100,000 tons of cement in 1978.[8]

Total exports were valued at $1 billion in 1978; oil formed 72% and diamond 7.7% of the total.[9] New trade pacts included one between Brazil and Angola signed in 1979 that would insure Brazil of receiving between 15,000 and 20,000 barrels of Angolan oil per day, beginning in early 1980. In return, Brazil will furnish various manufactured goods and equipment such as gasoline storage tanks and other accessories for fuel distribution. Zambia will start buying Angolan oil and cement in 1981 in return for copper and zinc product sold to Angola as a result of recent trade discussions. A trade agreement was also signed with Portugal in early 1979 that was the first practical result of the general cooperation treaty signed in June 1978, which was to deal in the future with economic and financial differences between the two nations. Trade between Angola and Portugal had decreased since the high point of 1974, when Portugal consumed 27% of Angola's exports, to a low point in 1976, when Portugal received only 6% of Angola's exports . U.S. trade with Angola was valued at $202 million for the first 11 months of 1978; this compares with $312 million for the same

[1]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and broken stone) presumably is produced for local consumption, but information is inadequate to make reliable estimates of output levels.

[2]Revised to none.

1977 period and $264 million for the first 11 months of 1976.[10] A law was passed in 1978 establishing a state enterprise, Angolan Exportation Company (EXPORTANGUEE), which was to have the objective "of exporting products and carrying on business operations" for the Ministry of Foreign Trade.

The fourth meeting of the intergovernmental group for establishing a preferential trade zone in eastern and southern Africa was held in June 1979 in Luanda, Angola, with delegations from 16 nations participating. The conference was held under the auspices of the Economic Commission for Africa (ECA), a United Nations agency, and was attended by Angola, Botswana, Comoro Islands, Djibouti, Ethiopia, Kenya, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Seychelles, Somalia, Swaziland, Uganda, Tanzania and Zambia. According to ECA, this was a first step toward forming a subregional common market.

COMMODITY REVIEW

METALS

Cobalt.—The extended copperbelt (from Zambia) in Angola has seen extensive exploration for cobalt. Geological reports apparently have indicated significant mineralization, but concern about political stability in eastern Angola has prevented further studies and development.[11]

Iron Ore.—New reports indicated a contract had been signed in 1979 with Austromineral, a subsidiary of the Austrian company Voest-Alpine AG, to study the possibility of renewing mining at the Cassinga iron ore mine. Austromineral was also to draw up plans for a new iron ore mine in the vicinity of Cassala-Quitungo, which will be slated to produce approximately 2 million tons of iron ore pellets per year.[12]

NONMETALS

Building Stone.—A shipment of 500 tons of black granite was exported from the port of Mocamedes to Japan in the middle of July 1978. This was the first commercial shipment of this stone since 1975.[13]

Cement.—A decree published in September 1978 allowed for the nationalization of part of the Secil Ultramar Cement Company. Shares excepted from this move were held by the Cement Investment Inc., FLS Overseas Inc., F.L. Smidth and Co., Inc., Potagua Inc., Knud Hojaards Fond, Contractor Holdingselskab, Ejendomsaktieselskbet Biblioteksgaarden, and several private Danish individuals. Only the Portuguese participation in the company was nationalized, including 29% held by the Lisbon company Secil and another 10% held by private Portuguese shareholders.[14]

Diamond.—In 1978, the Portuguese Government, on behalf of the nationalized Companhia de Diamantes de Angola (DIAMANG) Portuguese shareholders, froze about $8 million in DIAMANG assets in an attempt to force the Angola Government to negotiate more favorable conditions for operating the diamond marketing and for payment of $90 billion claimed for the nationalized assets. Portugal was demanding to continue as middle man between Angola and the Central Selling Organization because it felt that diamond sorting could not be properly carried out in Luanda. They also asked that Angola sign a 30-year operating contract with DIAMANG, that it have the status of a foreign-operated firm, and that remuneration be paid to the operator as 40% of the firm's net profit. The Angolan Government felt that 85% of DIAMANG'S former assets were already amortized and that the sum demanded by the Portuguese was inflated. Angola claimed to have also financed $33 billion in 1976 and 1977 to enable DIAMANG to meet its local wage and supplier obligations.[15] Consequently, after a special stockholders meeting in late 1977, in which a new board of directors dominated by Angolans was elected, the Angolans took charge of management and conduct of all DIAMANG's operations. In an effort to increase production, wages were increased for local miners and the company began to recruit managerial expertise from outside the country. Mining experts and technicians were being actively recruited from Europe through the Technical Services (MATS) Company in the United Kingdom, and a Belgian firm was cooperating in financial operations. To help stop illicit trading, a law was passed making it an offense to buy, sell, or give away a diamond, whether it was cut or not. On December 11, 1979, a further 283,039 shares of DIAMANG stock belonging to Portuguese entities were nationalized, and the

Angolan Government's share in the company was increased to 77.21%.

Quartz.—Quartz crystal and fusing quartz was being mined 50 kilometers south of Gabela in the west central part of Angola. Production at this new (1975) mine ceased during the civil war and was revived in 1977. The Government nationalized the operating company, Icomi Angola Ltd., in June 1978. Output for 1978 was about 1,500 tons, of which 25 tons was Grade A crystal quartz, with the remainder Grade B fusing quartz. Both grades of quartz contain 99.9% silicon dioxide with trace amounts of alumina, calcium, iron, potassium, sodium, titanium, and lithium. A third quality, Grade C, has a similar composition to Grade B, but is milky rather than transparent. Shipments are made through Porto Amboim. O. Priess & Co. a West German-based trading company, was awarded the quartz.

MINERAL FUELS

Petroleum and Natural Gas.—At yearend 1978, Angola had proven petroleum reserves of 1.4 billion barrels, down 3% from the 1977 reserve estimate; natural gas reserves were estimated at 47 billion cubic meters.[16] Angola's crude production of about 130,000 barrels per day came from a total of 171 producing wells at yearend 1978. Six wells out of a total of 14 new wells drilled in 1978 encountered oil. Plans for gas reinjection to improve production were to be implemented by Gulf Oil Company in 1981. A new agreement was signed with Texaco Petroleos da Angola in 1979 to develop three additional oilfields, which will add a further 50,000 barrels per day. The cost of developing these three fields (Essungo, Etele, and Cuntala) was estimated at $250 million.

According to the Petrofina annual report for the financial year 1978, the company's share of crude production from fields in the Kwanza and Congo basins was 7.7 million barrels, a reduction of about 12% compared with the previous year. This reduction, which was appreciable in the first half of the year, was due to the application of a Government ruling. Petrofina also reported the discovery of a small oilfield in the Congo basin in the Cuntala structure. Besides being a majority holder in Petrangol, Petrofina also owned 56.98% of Fina Angola, a petroleum distribution company. Fina was nationalized and integrated into Sonangol by the Government on January 1, 1979.[17]

Angola hired the U.S.- based consulting firm Arthur D. Little to advise it on oil legislation. A new loan law providing for state ownership of all newly found oil deposits was promulgated, with an offering of production sharing to be made between the national oil company,Société Nationale des Combustibles (Sonangol), and the firm making the discovery. Under terms of a new contract, Gulf Oil Company will retain an undivided 49% interest in petroleum production, while title to the Cabinda offshore concession belongs to Sonangol. Gulf's production of about 80,000 barrels per day was still far below the 130,000 barrels per day that the company could produce before the 1975 revolution that effectively halted development and exploration drilling for a short period. The State took a 16% royalty and an income tax of 65.75%, based on realized prices for Gulf's 49% share of production.

Sonangol was negotiating with a number of major oil companies over exploration concessions, offering a production-sharing plan for successful finds. Part of the 1979 agreement signed with Texaco included expenditure of about $110 million on exploration Block 2 and covered an area of 4,000 square kilometers of the Congo River Basin. Texaco will act as operator and will take a 40% share in the partnership with Sonangol, which will reserve the right to assign part of its 60% share to other companies. Both parties will contribute their proportionate share of costs and will share the venture's "profit oil." The profit oil will be divided between Sonangol and the partnership on a sliding scale, with 70% to 95% accruing to the state and the balance to the partnership. Sonangol's share of profit oil could be a minimum of 88% and a maximum of 98%, if it retains a full 60% participation. The venture will be taxed at 50% of the value of profit oil, through an arrangement which is intended to avoid double taxation of Texaco's earnings.[18]

The French oil company Elf-Aquitaine was granted offshore exploration rights in an agreement that would involve $41 million invested over a 3-year period. The concession covered an area of 4,000 square kilometers known as Block 3 in the Soyo area. Elf will be the operating company and hold a 50% interest. The group will include other foreign companies, which had not been named. Sonangol will retain 15% of the oil production initially, rising to 95% later.[19]

A production-sharing agreement was also signed by Total Compagnie Africaine des Petroles (Total-CAP) and Sonangol to invest

$30 million over 5 years in offshore oil prospecting. Total-CAP will be operator in a 4,000-square-kilometer tract offshore of Luanda. An agreement signed with Brazil's state-run oil company Petrobras in early May 1979 was to increase Brazilian-Angolan cooperation in several areas. Angola was to purchase oil rigs, drills, and other materials from Brazil, and Petrobras' international branch, Braspetro, was also to train Angolans in various aspects of oil production. The arrangement also included the provision of petroleum to Brazil.

Under a cooperation agreement signed with the Soviet Union, Sonangol will receive aid in offshore drilling operations and assistance with construction of a refined petroleum product storage facility. The Soviet Union will also train Angolan technicians. Sonangol also signed a cooperation agreement with Petrogal, the Portuguese nationalized oil company, for an interchange of technical expertise and future contracts for processing for crude oil at Portugal's main refineries at Sines, south of Lisbon.

Angola reported domestic petroleum products consumption of 2 million barrels for 1976, 2.6 million barrels for 1977, and 3 million barrels for 1978. A 90% increase in domestic consumption of petroleum products was anticipated for 1979.[20] Efforts to improve petroleum product supply service between Luanda and Cabinda included the acquisition in 1979 of a new petroleum tanker, Ngoleo, from Portugal. The new tanker allowed for more economical connections between the Luanda refinery and Cabinda Province. New bulk fuel storage facilities were also commissioned in Cabinda, and a provincial agency for marketing fuel products through Sonangol was established to improve distribution of petroleum products in Cabinda. The tanker had a liquid capacity of 300 cubic meters and could carry about 4 tons of miscellaneous cargo on deck.

The Mineral Industry of Argentina

By Orlando Martino[1]

Argentina's gross domestic product (GDP) declined by 4% in real terms in 1978 and was valued at $61 billion[2] at current prices. The economic recession resulting from the Government's stabilization program did not reduce inflation. The rate of inflation in 1978 increased slightly to 170% and ranked among the highest in the world, but was estimated to moderate to about 110% in 1979. The economy rebounded in 1979 and preliminary data indicate growth of the GDP in real terms of 7.5%.

Although Argentina has high mineral potential, its mineral industry, not including mineral fuels—coal, petroleum, and natural gas—accounted for less than 1% of GDP. More than two-thirds of Argentina's limited mining output was related to nonmetallics and industrial minerals, including products for the construction industry. The economic recession in 1978 was reflected primarily in the manufacturing sector where production decreased 7% and resulted in a drop in the domestic demand for metallic minerals. Production drops of 24% and 78% in the automotive and tractor industries, respectively, enabled Argentina to increase exports of steel. The construction industry, on the other hand, increased 8% in activity and helped form the basis for Argentina's record output of cement.

Argentina continued as the third largest producer of crude petroleum in Latin America, after Venezuela and Mexico, with new discoveries providing the basis for increased estimates of petroleum reserves. Increased petroleum output, a historic high in 1978, enabled Argentina to improve its self-sufficiency status to 93%, among the highest of the industrialized countries. Argentina was also a leading producer of natural gas in Latin America with a self-sufficiency status of 79% and ranked third in the region in proved reserves. Yacimientos Petrolíferos Fiscales (YPF) and Gas del Estado, both State-owned, were actively engaged in investment programs with the purpose of gaining national self-sufficiency in crude oil and natural gas.

In addition to this reduction in dependency on foreign crude oil, another salient event in 1978 was Argentina's achievement of self-sufficiency in aluminum from the aluminum smelter at Puerto Madryn that started up in 1976. Output at full capacity expected in 1979 would enable Argentina to become an exporter of this metal for the first time.

In 1978, the Government announced a $20.5 billion national investment plan for the 1979-81 period that would place a positive demand on the mineral industry of Argentina. About half of the new foreign investment in 1978 related to imports of capital goods for petroleum and natural gas production, and were almost entirely of U.S. origin.

Concerning new legislation, the long-awaited Risk Contract Hydrocarbon Law No. 21,778 was made public in April 1978 by the Secretary of Energy. It was designed to encourage exploration and development by local and foreign companies. Implementing regulations, Decree 1885 of August 15, 1978, were issued regarding the Transfer of Technology Law promulgated in August 1977. The long-awaited Mining Promotion Law No. 22,095 that replaces Law 20,551 was approved by the Government in late 1979 and became effective November 7 of said year. Reforms to Argentina's Mining Code were expected in early 1980.

In December 1979 the Secretary of Mining made four loans involving private exploration projects for copper, lead, silver, gold, bentonite, and fluorite in the Provinces of Chubut, Mendoza, Salta, and San Juan.

Argentina was determined to use its sizable natural gas reserves to replace as much petroleum as possible. In 1978, Buenos Aires was ordered to convert heating systems to natural gas within 6 years. The Government gas company, Gas del Estado, was expected to begin construction of a $75 million expansion of its gas system in Buenos Aires with 225 kilometers of new pipelines.

The Government was embarked on a program of reducing its use of oil and gas for electrical energy generation, while increasing the use of hydroelectric and nuclear resources. The Government was planning to substitute oil for natural gas where possible to take advantage of the large gas reserves of Tierra del Fuego. In 1978, hydroelectric sources met 26% of total electrical energy demand, and nuclear power, 10%. Argentina's total installed electrical generating capacity increased 12.7% to 11,456 megawatts. The energy development plan for 1977-78 of $24.4 billion prepared by the Secretariat of Energy includes $12 billion for electrical energy development.

In 1978 the Inter-American Development Bank (IDB) approved a $210 million loan to Entidad Binacional Yacyretá (EBY), an institution created by a treaty between Argentina and Paraguay to help build the 2,700-megawatt multipurpose Yacyretá-Apipé hydroelectric complex on the Río Paraná. The cost of the complex on the border of the countries was estimated to exceed $4.5 billion. The complex is scheduled for completion in 1985.

By yearend the civil works were practically completed for the 1,890-megawatt Salto Grande hydroelectric complex on the Río Uruguay being executed by the Comisión Mixta de Salto Grande established by Argentina and Uruguay. Several of the 14 large turbines had arrived at the dam site for installation. In 1978 the 440-megawatt hydroelectric station of Futaleufú in Chubut Province was completed.

PRODUCTION

Data on Argentina's production of minerals and mineral fuels for 1978 and 1979 are given in table 1. The mineral industry of Argentina continued to be geared to the demands of the domestic market. The low production of strategic mineral commodities such as ores of copper and iron made it necessary to rely heavily on foreign supply. There was no output of bauxite to supply the expanding aluminum industry.

Aside from the mineral fuels such as coal, natural gas, and petroleum, mining output continued to be dominated by the nonmetallics and industrial minerals. In 1977, for example, mine production of metallic ores and concentrates represented only 15% of the total value of mining production. In contrast, mine production of metals in Brazil account for 30% of total value.

A salient event of 1978 was Argentina's achievement of self-sufficiency in aluminum production. Aluminum output reached a record high from increased utilization of capacity as more power became available from the Futaleufú dam. Output of primary iron, crude steel, and cement also reached historic high levels. Production of crude petroleum continued to rebound from the depressed level of 1975 and exceeded the peak output of 1972 up to record highs in 1978 and 1979. On the other hand, production of lead/zinc concentrate and natural gas in 1978 was lower than in 1977.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed, cadmium, lime, and perlite are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.
[2]Reported figure.
[3]Hot-rolled semimanufactures only; excludes castings and cold-rolled semimanufactures produced from imported hot-rolled semimanufactures.
[4]Includes plastic, semiplastic, and/or ferruginous clays used totally in the manufacture of portland cement.
[5]As reported; differentiation between this material and other calcareous stones reported is not apparent from the source publication.

TRADE

Argentina's favorable balance of trade showed further improvement in 1978 as the trade surplus widened to $2.40 billion compared with the $1.49 billion surplus of 1977. Total exports valued at $6.35 billion increased 12% while total imports of $3.94 billion decreased 5% in line with the generally depressed state of the economy. Mineral commodities were a very small part of Argentina's exports dominated by agricultural commodities such as grains, meat products, hides, and wool.

According to statistics published by the Secretaria de Estado de Mineria, exports of minerals, partially refined products and metals, not including steel or mineral fuels, reached an all time high of $34 million in 1978, a 64% increase over the $21 million exported in 1977 and almost triple the $12 million exported in 1975. Although mineral exports are insignificant in total trade, they indicate an increasing trend in the export of Argentina minerals. Diverse mineral products were exported to 30 countries, and 153 local companies were involved in international sales. The more important mineral exports ranked by value and their major markets are shown below for 1978:

Mineral exports	Value in thousand dollars	Major markets
Sodium borate	6,530	Brazil, United States.
Lead concentrate	6,093	Brazil, United States, Belgium.
Tin/silver concentrate	5,274	Great Britain.
Zinc ingot	3,770	Brazil, Uruguay, Holland.
Borate compounds	2,125	Brazil, Uruguay.
Granite blocks	1,175	Italy, Spain.
Salt	1,003	Paraguay, Nigeria.
Uranium concentrate	929	Great Britain.
Boric acid	847	Brazil, United States.
Perlite, expanded	693	Brazil, Chile.
Bentonite	623	Brazil, Chile, Bolivia.
Lead ingot	598	Uruguay, Japan.

Brazil (55%) was the major export market in 1978, followed by Great Britain (19%), the United States (5%), Italy (4%), Paraguay (4%), and Uruguay (3%). The countries of the Latin American Free Trade Association (LAFTA) purchased 63% of Argentina's mineral exports, and the European Economic Community, 22%. As for particular commodities, increased amounts of boric acid, clays, processed borates, sodium borates, zinc ingot, and dolomite were exported during 1978.

After a lapse of 10 years, Argentina in mid-1979 resumed mineral exports to the Soviet Union with a shipment of zinc concentrate from the El Aguilar mine valued at $1.8 million.

Argentina's exports of steel increased substantially in 1978 by $250 million, while imports decreased. For example, imports of pig iron decreased from 136,000 tons in 1977 to 50,000 tons in 1978 and semimanufactures decreased sharply from 851,000 in 1971 to 350,000 tons in 1978.

After a lapse of decades in 1979 Argentina resumed exports of gold and silver valued at $5 million. They were produced by Cerro Castillo S.A. operating mines in Chubut Province.

Imports of primary materials, semimanufactures, and fuel and lubricants represented 68% of Argentina's total imports in 1978. Imports of petroleum, valued at $218 million, decreased 3% relative to 1977 while imports of natural gas from Bolivia and Chile, valued at $108 million increased 15% to cover the decline in domestic output. The drastic reduction in aluminum imports from almost 73,000 tons in 1972 to zero in 1978 and 1979 reflected Argentina's success in achieving self-sufficiency in this important metal. Calcined alumina was imported mostly from Australia.

Imports from the United States in 1978 were 22% of Argentina's total, up from 18.5% in 1977, of which the most important mineral-related commodity continued to be metallurgical coal. The United States was Argentina's largest single trading partner overall.

COMMODITY REVIEW

METALS

Aluminum.—Argentina's first aluminum smelter, with a capacity of 140,000 tons per year, operated by Aluminio Argentino S.A.I.C. (ALUAR) was able to increase its production because of increased availability of electrical energy from the Futaleufú dam. With demand in 1980 projected at 80,000 tons and the plant operating at full capacity, 60,000 tons of aluminum would be available for export. However, since ALUAR contracted to supply 20,000 tons of aluminum in exchange for imported bauxite, this would leave only 40,000 tons for other foreign markets.

Beryllium.—Argentina continued as the third largest producer of beryl, a beryllium ore, after the U.S.S.R. and Brazil. (The United States is also a significant world producer of the ore and beryllium-copper alloys, but from the mineral bertrandite). Production of high-quality ore containing about 12% BeO has been from an extensive pegmatite zone in the Pampean Ranges. Beryl was mined primarily at the La Viquita deposit in the Province of San Luis and to a lesser extent at the Lux deposit in Córdoba Province. Some beryl-bearing pegmatites are found in the Provinces of Catamarca, La Rioja, San Juan, and farther south in Río Negro.

Copper.—The Compañía Minera Aguilar S.A. (CMA), a subsidiary of St. Joe Minerals Corp., continued development of the El Pachón copper deposit, principally through performing special studies at the tailings dam site and carrying out additional drilling at the mine. Definitive investment and financial plans for the $940 million project were expected to become finalized considering the approval in late 1979 of the new mining promotion law.

Fabricaciones Militares (FM), the Government agency responsible for identifying and exploring new ore deposits and for negotiating with foreign investors to develop them, was evaluating several prospects located in northwestern Argentina: Bajo La Alumbrera (copper, gold, molybdenum), Famatina mining district (copper, molybdenum), Cerro Mercedario (copper, molybdenum), and Basic Rock Area (copper, nickel). Bajo La Alumbrera, located southwest of San Miguel de Tucumán, appeared relatively promising. This deposit, with a copper equivalent grade of 0.85% copper, has reserves estimated at 300 million tons. The project as defined in the prefeasibility study was based on the output of 266,000 tons of concentrate per year containing 23% copper. Evaluation of the prefeasibility study by Kaiser Engineers was nearing completion. The other three projects mentioned were in the early exploration and drilling stage.

Since domestic production of copper is insignificant, Argentina depends on imports of some 45,000 tons per year of copper to meet demand. The development of the El Pachón deposit alone would satisfy internal demand and provide a surplus for export.

Iron Ore.—Argentina imported most of the iron ore required by its steel industry that in 1977 came primarily from Latin America: Brazil - 70%, Chile - 11%, Peru - 10%, and Venezuela - 5%. The remaining iron ore imports were supplied by Liberia, Sweden, and the Republic of South Africa. An experimental shipment of 3,300 tons was received from the El Mutun deposit in Bolivia. Imports of iron ore in 1978 increased because of the startup of Industria Argentina de Aceros, S.A.'s (ACINDAR) direct reduction steel plant and the new raw material mix at the Zapla steel plant.

Argentina's overseas dependency will change significantly with the availability of iron ore from the Sierra Grande underground mine. In 1978, sinking of a 23-foot diameter vertical production shaft to a depth of 1,575 feet was begun at the Sierra Grande Mine. After completion of the shaft a primary ore crusher was installed underground. In December 1978, startup tests were performed on the 12-kilometer ore concentrate slurry pipeline to the pellet plant at the Punta Colorado port. Startup of the pellet plant by Hierro Patagónico de Sierra Grande S.A. (HIPASAM) came after 10 years of effort. Initial shipment of pellets took place in September 1979. At full capacity, production will total 2.5 million tons of iron ore pellets per year.

Consumption of iron ore by the Argentina's steel industry amounted to 2,136,000 tons of which 45% was in pellet form in 1977.[3]

Iron and Steel.—Production of crude steel continued its upward trend in 1978 and 1979, following the drop in output in 1975. At yearend 1978 Argentina's steel capacity amounted to 3.1 million tons of which 2.3 million tons related to blast furnaces and the balance to direct reduction. The State-owned steel company's Sociedad Mixta Siderúrgia Argentina (SOMISA), accounted for 90% of the output from blast furnaces. Two companies, Dalmine Siderca S.A. I y C and ACINDAR had the only direct reduction facilities. During 1978 investments in the steel sector declined to $200 million from $250 million in 1977, but were expected to increase to $274 million in 1979.

SOMISA was in the process of revising its master plan under consultation with the Nippon Steel Corp., to increase steel capacity from 2 to 4.7 million tons per year. To accomplish this, Nippon Steel proposed the installation of a third blast furnace with a capacity of 3,600 tons per day. It was also proposed to increase the capacity of the hot-rolled mill from 1.0 to 1.5 million tons per year. The expanded operation was scheduled for 1984-85.

In August 1978, ACINDAR initiated operations of its 462,000-ton-per-year Midrex direct reduction plant. ACINDAR is totally integrated from iron ore to finished product and the leading steel company in the private sector. ACINDAR has a capacity for 1 million tons of rolled products including merchant bars, wire rod, reinforcing bars, and galvanized welded pipe.

Dalmine Siderca was planning to expand its direct reduction capacity from 320,000 to 700,000 tons per year of sponge iron and to increase its steel capacity to 585,000 tons per year.

In line with Argentina's drop in GDP in 1978, domestic demand for steel products declined an estimated 35%. On the other hand, exports of steel products, mostly to Latin American countries, increased sharply to a new historical record. Please refer to table 4 for pig iron and steel projections.

Table 4.—Argentina: Projection of steel production and consumption of coking coal

(Million metric tons)

	Crude steel	Pig iron[1]	Coking coal consumption		
			Total	Domestic	Imported
1980	4.2	1.9	1.7	0.2	1.5
1985	8.1	5.0	4.4	.4	4.0
1990	14.0	7.5	6.5	.6	5.8
2000	28.0	12.5	10.6	1.0	9.6

Source: Instituto Latinoamericano del Fierro y el Acero (ILAFA), Papers presented to ILAFA Congress in Bogotá, Colombia, Apr. 26–27, 1979, "Coal—79; Mining, Uses and Supply," p. XIII.

Lead, Silver, and Zinc.—Mine output by CMA, as reported in the 1978 annual report of the St. Joe Minerals Corp., declined 19% for lead/silver concentrate and was 14% lower for zinc concentrate. Because of the industrial recession in 1978, CMA shipped only 59,900 tons of zinc concentrate. Lead shipments were close to 1977 levels because of a shipment of 8,400 tons to Brazil.

CMA was planning to drive a new lower level access adit at its El Aguilar Mine to facilitate extraction of available argentiferous lead/zinc sulfide ore reserves and to provide access to areas of deeper mineralization. The Empresa Minera Pan de Azucar, S.R.L. was also a producer of lead, silver, and zinc at its Pan de Azucar Mine in the Province of Jujuy. In November 1979, NL Industries Inc. sold its three Argentine subsidiaries to a private investor in Argentina. The three subsidiaries - National Lead Co., Industries Deriplom S.A., and Corinda S.A. - sold smelt lead, fabricated lead products, and lead oxides.

Magnesium.—National and provincial authorities were cooperating in determining the volume of magnesium chloride at the La Amarga salt lake in the Puelches region of the Province of La Pampa. This zone has the basic infrastructure for the eventual installation of an industrial plant. Argentina consumes metallic magnesium in producing aluminum alloys. Demand of some 1,000 tons per year was met entirely by imports.

Consumption of magnesium compounds for the production of refractory brick amounted to 25,000 tons per year and was imported entirely from Brazil, Greece, and Israel.

Manganese.—The state mining company Yacimientos Mineros Aguas del Dionisio (YMAD) initiated production in August 1978 at its Farallón Negro Mine and plant in Catamarca Province located several kilometers from its copper deposit, Bajo La

Alumbrera. The 25,000 tons per year of manganese concentrate to be supplied by the Farallón Negro operation will partly meet Argentina's supply deficit and reduce imports which have been at the level of 77,000 tons per year. Ore reserves are adequate to permit mining over 25 years with a possible extension to 40 years. Gold and silver will be recovered at Farallón Negro as byproducts.

Titanium.—The commission for the development of Light Metals (Comision para el Desarrollo de Los Metales Livianos-COPEDESMEL) resumed prospecting work on the southern sands of the Province of Buenos Aires that had been initiated in 1961. Argentina is known to have important areas of titaniferous sands all along its Atlantic coastline.

NONMETALS

Cement.—A historic high in cement production was achieved in 1978. Output had been improving steadily since 1976 when cement plants obtained equipment replacements from overseas.

Cía. Sudamericana de Cemento Portland Minetti S.A. received a $9 million loan from the International Finance Corporation (IFC) to build a new 400,000-ton-per-year cement plant at Malagueño in the central Province of Córdoba. At the end of 1979, seven cement companies were operating 17 plants with an installed capacity of 8.65 million tons.

Fluorspar.—Argentina was the third most important producer of fluorspar in Latin America after Mexico and Brazil. About 75% of output came from the Grupo Leachosa deposit in Río Negro Province. The principal producer was the Sierra Grande S.A. In September 1979, the Secretary of Mining approved a private project to install a $10 million beneficiation plant for fluorspar at Puerto Madryn, Province of Chubut, by Minera Patagónica S.A. Completion date was scheduled for 1982.

Sulfur.—Argentina produced only 10% of total demand. Sulfur imports are expected to decrease when the copper projects mentioned above are in production. One of the largest producers was Establecimiento Azufrero Salta controlled by Fabricaciones Militares. The ore, averaging 25% sulfur is mined high in the Andes in Salta Province.

MINERAL FUELS

In mid-1979 the Government of Argentina agreed to undertake a comprehensive energy and resource assessment with the cooperation of the United States under its International Energy Development program. The Energy Coordinating Committee is to be chaired by the Secretariat of Planning in the office of the President. The assessment will be made over a period of 15 to 18 months and initially will focus on energy demand data collection and analysis.

A gasohol (Alconafta) pilot program was launched in July 1979 in Tucumán Province, in a sugar cane growing region.

Coal.—According to projections prepared by the Latin American Iron and Steel Institute (ILAFA) shown in table 4, Argentina is expected to remain heavily dependent on imports to meet the demand of its iron and steel industry for coal of coking quality. SOMISA operated a coking plant with a total of 165 ovens in its steel complex. The last two batteries of 40 ovens each were incorporated in 1973-74. Argentina's steel expansion plans would require additional coking capacity by 1985.

Argentina continued to import its coking coal from the United States (70%) and Poland (20%); the balance of its demand was met domestically from Río Turbio and petroleum coke. Demand for steam coal from Río Turbio was expected to increase with the construction of an important thermoelectric station at Bahia Blanca.

Natural Gas.—Although the amounts of marketed natural gas decreased for the first time in the recent past, after a period of steady growth, imports of natural gas continued to rise. In 1978 imports increased 9% to 79.53 billion cubic feet and were valued at $108 million, an increase of 15% over the 1977 value. Imports of natural gas (mostly from Bolivia) represented 21% of Argentina's total apparent consumption in 1978.

Gas del Estado, a Government agency, completed construction in December 1978 of the gas pipeline connecting the gasfields of Tierra del Fuego (San Sebastián, Cañadón Alfa, Cañadón Beta, and Cañadón Piedras) to the main southern (austral) truckline which leads northward 2,100 kilometers to Buenos Aires. The 205-kilometer pipeline included a 37-kilometer section under the Strait of Magellan from Cabo Espíritu Santo to Cabo Vírgenes. Natural gas from Tierra del Fuego began to flow in early 1979. Ultimate capacity of the pipeline is 212 million cubic feet per day. The National Territory of Tierra del Fuego contributed from existing operations 5.2% of Argentina's crude oil production and 5.3% of its total natural gas production. Gas reserves in the Argentina sector of Tierra del Fuego were estimated at 52 billion cubic meters or 1.8 trillion cubic feet.

The new gas processing plant in Campo Durán in the Province of Salta will permit YPF to recuperate 95% of the propane in the natural gas imported from Bolivia. Basic engineering and construction supervision was provided by Fish International Engineering Inc. of Houston, Tex. Construction and detailed engineering for the turboexpansion plant was accomplished by a consortium of Argentine companies.

New gas deposits were discovered in Loma de La Lata in Neuquén Province. At yearend, Argentina's proved natural gas reserves were estimated at 15.26 trillion cubic feet, a substantial increase.

In July 1978 Gas del Estado changed its status to that of an autonomous state enterprise, the status that YPF had obtained in April 1977.

Petroleum.—As a combined result of increased oil output and decreased apparent domestic consumption, Argentina's self-sufficiency improved to 93% in 1978 compared with the 88% status in 1977. For comparison, in 1965 self-sufficiency was at 78%, growing to 90% by 1970. YPF accounted for 68% of total crude oil production and contractors for 32% compared with the 76% and 24% breakdown, respectively, in 1977. Secondary recovery accounted for 12% of total output.

Much of the increased oil production was related to the renewed efforts of private industry. Amoco Argentina Oil Co. entered into an agreement in 1978 with the Government to invest $57 million in a program of secondary recovery using water injection in the oilfields of Cerro Dragón and Cañadón Grande in Chubut Province, the second most important oil producing area in southern Argentina. Amoco expected to increase total oil recovery by 27 million barrels.

During 1978 and 1979 oil exploration was intensified. Oil discoveries enabled YPF to add 460 million barrels to Argentina's reserves which at yearend 1979 were estimated at 2.4 billion barrels. In 1978 onshore oil discoveries in Mendoza Province included Agua Botada well located south of Malarque as well as Cajón de Los Caballos and Los Volcanes further south. In Neuquén Province still further south, a wildcat discovery was reported by YPF near the Llancanelo field. In Argentina's mountainous northwestern Province of Salta, YPF made an oil and natural gas discovery near Tartagal which required further evaluation. Offshore in 1978, YPF made its first discovery in the San Jorge basin, 17 kilometers east of Comodoro Rivadavia. The Tehuelche well in the continental shelf was the first of five wildcats planned.

In April 1978 the Secretary of Energy made public the long-awaited Risk Contract Hydrocarbon Law No. 21,778. The law authorizes State enterprises to conclude risk contracts for the exploration and development of hydrocarbons and provides the contractors with certain tax and import incentives. It was also announced that 19 areas throughout Argentina would be put up for bid under the new law beginning in the second half of 1978. Included in areas onshore are six in the north around Salta, five in the center west around Neuquén and two in the south in Santa Cruz Province; four areas are offshore: Three off of Tierra del Fuego and one in the Colorado basin opposite Buenos Aires.

Under the new law, the contractors must assume all risks of exploration and development and must bear all capital costs and other investments required in the contract area. The contractors will not acquire any mineral rights over the deposits discovered in the contract area nor over the hydrocarbon extracted. The contractors will be paid in cash per unit of production. Once the internal needs of the country are satisfied and an adequate margin of reserves are ensured, the contractors may be paid in gas or oil. The term for executing exploration contracts may not exceed 7 years offshore and 5 years onshore, although the period may be extended by 2 years to evaluate any discovery. The period for development of production may not exceed 25 years from the date it is determined that a deposit is commercially exploitable. Foreign investments for exploration and development of hydrocarbons will be excluded from the requirements of Foreign Investment Law No. 21282.

On July 3, 1978, YPF awarded a risk contract covering Tierra del Fuego Area I to a group headed by the Argentina company of Bridas S.A., and including ARFRANCO S.A., Deminex Deutsche Erdolver Sorgus Gessellshaft of West Germany, and Total Exploitation S.A. of France. In March 1979 YPF opened the bids for five exploration areas: Three onshore comprised of Acambuco (Salta), Picún Leufú (Neuquén) and Meseta del Guenguel (Chubut/Santa Cruz); and two offshore areas comprised of Río Gallegos and Magallanes (both in the Austral Basin). During the summer of 1979 the

Government approved the bid awards covering the Río Gallegos and Magallanes areas to the Shell Group headed by Shell Hydrocarbona BV and Shell Cía Argentina de Petroleo.

Uranium-Nuclear Energy.—The Comisión Nacional de Energía Atómica (CNEA), founded in 1950, was responsible for the exploration and development of uranium resources and the production of nuclear energy. Plants for processing uranium ore into yellow cake are located in Malargüe (Province of Buenos Aires), Don Otto (Province of Salta), and Los Adobes (Province of Chubut). The Empresa Nuclear Mendoza, a Government entity, was responsible for installing the uranium leaching operation for the Sierra Pintada uranium mining project of CNEA in Mendoza Province.

In 1977 the capacity of the Atucha I nuclear station, started up in 1974, was increased 8% to 367 megawatts. Work continued on the second nuclear station "Embalse" in the Province of Córdoba with a planned gross capacity of 644 megawatts and scheduled for completion by yearend 1980. In April 1979 Argentina received five foreign bids to build 600-megawatt Atucha II near Atucha I, based on natural uranium and heavy water. A contract was awarded for the construction of a heavy water pilot plant at Ezeiza in the Province of Buenos Aires. Bidding for the construction of a heavy water plant at Arroyito in Neuquén Province was scheduled for 1979.

Argentina continued to progress with its program of integrating its operations, from the mining of uranium to the manufacture of nuclear fuel pellets. In October, ACINDAR, carried out an industrial-scale forging of the first zircalloy ingot, a zirconium alloy of tin, chromium, and iron, at its plant in Villa Constitutión, Santa Fe Province. Zircalloy is used to manufacture the sheaths that contain the uranium fuel.

The Mineral Industry of Australia

By Charlie Wyche[1]

Although the overall upward trend in value of Australia's mineral production prevailed in 1978 and 1979, there were considerable variations in both production and exports of certain commodities. Although these variations were influenced mostly by world market conditions, they were also affected by some changes in the domestic mineral policy. Investment allowances, various tax concessions, and the establishment of import parity prices for crude oil assisted and encouraged many companies during 1978 and 1979. However, exporters and some importing countries were concerned when the Federal Government issued new guidelines for exporting iron ore, coal, bauxite, and alumina. These guidelines were widely criticized as an attempt by the Government to take over commercial negotiations. Permission to develop several major uranium mines was granted by the Federal Government in 1979, and Australia could become a significant world supplier of uranium by the mid-1980's. Exploration for diamond got underway in 1978, and continued at a rapid pace throughout 1979. Most of the activity was concentrated around the Kimberlite pipes in Western Australia.

In 1978, the value of mine and quarry production was a record $4.7 billion,[2] an increase of 4% compared with the $4.5 billion reported for 1977. This figure increased 8% to about $5.1 billion in 1979. The $6.1 billion value added by domestic smelting and other processing of mineral commodities credited the mineral industry with a total product valued of $11.2 billion. This figure represents 9.8% of the $114 billion adjusted gross national product (GNP) in 1979.

The Government granted authority to the States to raise loan funds for infrastructure in 1979. As a result, New South Wales was planning to spend $89 million on improving coal-loading facilities at Port Kembla and $200 million on the Eraring electric power station and associated coal mines. Queensland was planning to invest $210 million in improving coal-loading facilities and various electric powerplant extentions. Victoria was to spend $350 million on the Loy Yang brown coal powerplant and mine. Tasmania would invest $78 million on further hydroelectric works, and Western Australia was planning to borrow $420 million to construct a pipeline to carry North West Shelf gas to Perth and a further $110 million to integrate the electric power supply in the Pilbara iron mining area.

There were strong indications of a revival in domestic mineral exploration and development from the private sector in both 1978 and 1979. Local and overseas companies demonstrated confidence in the future of mining by investing about $810 million in 1978 and about $900 million in 1979. Investors were undoubtedly encouraged when the Government modified its foreign investment guidelines in early 1978. Now, companies with only 25% Australian ownership and an expressed intention of increasing this percentage would be regarded as Australian companies.

PRODUCTION

Mine output of most of the about 70 minerals produced in Australia in 1978 and 1979 was at or above the level for 1977. The main exceptions were iron ore, lead, zinc, nickel, copper, and bauxite in 1978, and titanium and tin in 1979. The decline in iron ore production reflected the continuing recession in the world steel industry. Although the industry did manage to raise deliveries to markets in Europe and to China, which only partially compensated for lower sales to Japan. For the first time since the Australian aluminum industry started to grow in the early 1960's, output of bauxite declined in 1978 but resumed the upward trend in 1979. Industrial disputes at Weipa, where production dropped 20%, was primarily the reason for the decline, but lower demand in exports markets was also a factor. The decline in production of nickel in ore and concentrates in both 1978 and 1979 reflected the closure of the Redross and Windarra mines, the output of which was only partially replaced by the startup of the Agnew Mine. Copper output declined slightly in 1978, but showed a significant gain in 1979. This industry has been severely affected by depressed conditions in the market in recent years. The decline in lead and zinc production in 1978 reflected low ore grades at Mount Isa and reduced output at the New Broken Hill Consolidated Mine.

Western Australia remained the country's largest mineral-producing State, accounting for 36% of the total value of mineral output in 1978 and about 38% in 1979. The value of minerals produced totaled $1.72 billion in 1978, an increase of 1.2% over that of 1977. The main factor in the overall mineral value increase was the quantity of gold produced, since the value of iron ore increased only slightly and value of nickel declined significantly. The value of iron ore production increased from $955 million in 1977 to $961 million in 1978. Alumina value increased by $2 million to $278 million, and nickel ore value dropped approximately $62 million to $186 million. The value of gold production increased $32 million to $74 million, and that of petroleum (crude oil and natural gas) by $34 million to $95 million.

The value of mineral production in Queensland in 1978, the second largest producing State (25% of total value), totaled $1.20 billion, compared with $1.25 billion in 1977; 1978 was the first year since 1964 that the value declined. Various factors such as industrial problems, prices for metals, and marketing arrangements had significant bearing on the value of production. Coal and copper, which earned $634 million and $174 million, respectively, were the principal contributors to the mineral value. Other significant minerals produced in Queensland were bauxite ($76 million), lead ($74 million), zinc ($58 million), silver ($57 million), and tin ($19 million).

New South Wales, with its base metal and coal industries, ranked third in 1978, accounting for 18% of the total national value. Victoria, with substantial brown coal output, was fourth with 13%. Tasmania, South Australia, and the Northern Territory, with a wide variety of minerals such as copper, tin, bauxite, and zinc, contributed the remainder.

Table 1.—Australia: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1976	1977	1978[p]	1979[e]

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]Reported figure.
[2]Exports (production not officially reported).
[3]Data are for years ending Nov. 30 of that stated for plants owned by The Broken Hill Pty. Co. Ltd.
[4]Western Australia only. Metal content of nickel ore.
[5]Excludes production from Western Australia.
[6]Data are for years ending June 30 of that stated.
[7]Excludes production from Northern Territory and Australian Capital Territory.
[8]Excludes production from Northern Territory, Australian Capital Territory, and Western Australia.
[9]Excludes natural gasoline and liquefied petroleum gas, which are produced on Barrow Island, off the Western Australia coast. An unspecified portion of the liquefied petroleum gas extracted is apparently marketed locally, but this quantity is limited. The bulk of the liquefied petroleum gas and all of the natural gasoline is blended with crude oil and presumably is counted with crude oil from that area. Gross production of liquefied petroleum gas on Barrow Island was as follows, in thousand barrels: 1976—22, 1977—31, 1978—29, and 1979—NA; and of natural gasoline: 1976—21, 1977—26, 1978—33, and 1979—NA. Natural gas liquids output from several gasfields in Western Australia is excluded for similar reasons. Condensate production from these fields was as follows, in thousand barrels: 1976—25, 1977—23, 1978—19, and 1979—NA.
[10]Residual fuel oil equivalent.

TRADE

Minerals and mineral products supplied about 38% of Australia's total export value in 1978 and 40% in 1979. Increased exports and higher prices of some minerals caused export income to increase by 7% to $5.0 billion in 1978. This figure represents a sharp decline when compared with the 30.4% average increase during the preceding 4 years. The reason for the small growth rate in exports was attributed to the depressed world economy that led, in general, to depressed prices. Coal remained Australia's largest export commodity. The value of Australia's exports of coal was $1.51 billion in 1978 and $1.60 billion in 1979, that of iron ore and pellets $921 million and $980, and alumina and bauxite $800 and $820 million; these three commodities represented 30%, 18%, and 16%, respectively, of the 1978 mineral export value. Other large export earners were copper, lead, zinc, mineral sands, gold, nickel, and tin. Collectively, these commodities accounted for 19% of the total export value in 1978.

The value of mineral imports was around $1 billion in 1978; crude oil accounted for about 80% of total value. The other principal import categories were phosphate rock, asbestos, and diamond.

Table 2.—Australia: Exports and reexports of mineral commodities[1] [2]

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal destinations, 1977

Other value, thousands	$1,232	$1,265	New Zealand $481; Indonesia $379; New Caledonia $165.
Nonrefractory do	$230	$344	Papua New Guinea $116; New Zealand $54; Fiji $44.
Diamond:			
Gem, not set or cut carats	12,182	13,597	Israel 3,471; Hong Kong 3,448; Belgium-Luxembourg 2,865.
Industrial do	256,218	297,018	Ireland 134,693; United States 90,597; Philippines 33,761.
Fertilizer materials:			
Crude	184,915	298,478	Japan 185,299; Republic of Korea 34,000; Philippines 24,150.
Manufactured:			
Nitrogenous	1,160	7,228	New Zealand 6,942; Papua New Guinea 90; Sweden 71.
Phosphatic (excluding basic slag)	169	249	Papua New Guinea 140; Indonesia 104.
Potassic	--	33	British Solomon Islands 30; Hong Kong 1; New Zealand 1.
Other, including mixed	349	787	Papua New Guinea 359; New Zealand 312; Western Samoa 100.
Ammonia value, thousands	$1,947	$170	New Zealand $144; Papua New Guinea $10; Fiji $9.
Gem stones, except diamond:			
Opal do	$22,974	$20,134	Hong Kong $9,287; United States $3,799; Japan $3,120.
Sapphire do	$3,646	$6,625	Thailand $4,389; Hong Kong $768; United Kingdom $508.
Other do	$1,537	$1,878	Hong Kong $592; New Zealand $221; Papua New Guinea $160.
Gypsum	209,083	193,750	New Zealand 94,165; Indonesia 40,672; Mozambique 24,491.
Lime: Quicklime, slaked lime, hydraulic lime	1,170	37	Papua New Guinea 34.
Magnesite	65	123	United Kingdom 71; New Zealand 44; Malaysia 4.

See footnotes at end of table.

Table 2.—Australia: Exports and reexports of mineral commodities[1 2] —Continued

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal destinations, 1977
NONMETALS —Continued			
Mica, worked value, thousands	$67	$89	New Zealand $66; Indonesia $19; Malaysia $3.
Pigments, mineral:			
Natural, crude	23	53	Singapore 18; Papua New Guinea 13; Malaysia 9.
Iron oxides, processed	32	28	Papua New Guinea 21; New Zealand 5.
Pyrite, unroasted, gross weight[8]	248	261	New Zealand 166; Malaysia 54; Papua New Guinea 40.
Salt and brines thousand tons	4,092	4,154	Japan 3,200; Taiwan 422; Republic of Korea 362.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	2,593	301	Indonesia 72; Fiji 71; New Zealand 63; Philippines 36.
Caustic potash	33	3	Papua New Guinea 2.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	757	193	Taiwan 141; Japan 36; New Zealand 11.
Worked value, thousands	$38	$120	New Zealand $97; Philippines $8.
Sand and gravel and crushed rock thousand tons	1,065	467	Japan 375; Republic of Korea 44; United States 31.
Sulfuric acid	225	120	Papua New Guinea 42; Sri Lanka 18; Bahrain 16.
Talc, steatite, soapstone, pyrophyllite	63,445	93,104	Japan 78,532; Netherlands 10,553; New Zealand 2,112.
Other:			
Crude:			
Quartz, mica, feldspar, fluorspar, cryolite	662	81	New Zealand 77.
Refractory materials, n.e.s	47	20,037	Taiwan 19,952; New Zealand 67.
Other value, thousands	$161	$521	West Germany $398; United States $96.
Oxides and hydroxides of magnesium, strontium, barium	155	8	Japan 3; Fiji 2; New Zealand 2.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s value, thousands	$4,484	$4,670	Canada $2,612; Iran $408; Singapore $397.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	31,988	42,799	Indonesia 13,808; Thailand 10,124; New Zealand 7,301.
Coal and peat, including briquets:			
Bituminous coal and briquets thereof thousand tons	34,441	45,163	Japan 26,427; Netherlands 1,957; France 1,763.
Lignite and peat and briquets thereof	24,497	29,049	Japan 27,432; Republic of Korea 1,519.
Coke and semicoke	188,794	149,435	Philippines 106,933; Belgium-Luxembourg 24,601; Vietnam 10,038.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	1,297	1,324	New Zealand 1,267; Singapore 57.
Refinery products:			
Gasoline do	1,758	2,114	New Zealand 1,607; Fiji 295; Singapore 101.
Jet fuel do	2,032	1,826	New Zealand 1,288; Fiji 509; Mozambique 23.
Kerosine do	242	364	New Zealand 244; Fiji 107.
Distillate fuel oil do	2,880	4,685	New Zealand 2,022; Japan 1,024; Singapore 630.
Residual fuel oil do	4,677	1,460	Singapore 708; United States 363; Japan 229.
Lubricants do	1,288	1,742	New Zealand 366; Indonesia 279; Singapore 262.
Other do	264	226	New Zealand 87; Bahrain 58; Taiwan 31; Singapore 28.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals value, thousands	$5,178	$1,713	Japan $1,000; Singapore $378; Philippines $173.

NA Not available.

[1]Data are for fiscal years beginning July 1 of that stated.

[2]Values are in Australian dollars.

[3]Australian Mineral Industry Quarterly. V. 30, No. 2 for quarters ending September and December 1976; and V. 31, No. 1 for quarters ending March and June 1977.

[4]Australian Mineral Industry Quarterly. V. 31, No. 2 for quarters ending September and December 1977; and V. 32, No. 1 for quarters ending March and June 1978.

[5]The value of an unreported amount of manganese ore is included in "Other ores and concentrates of base metals."

[6]Includes the value of an unreported amount of bauxite and manganese ore.

[7]Less than 1/2 unit.

[8]Includes elemental sulfur, other than colloidal.

Table 3.—Australia: Imports of mineral commodities[1] [2]

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal sources, 1977
METALS			
Aluminum:			
Oxide and hydroxide	6,335	4,626	Japan 2,353; United States 1,085; Austria 306.
Metal including alloys:			
Scrap	1,453	1,369	New Zealand 1,221; United Kingdom 133.
Unwrought	347	178	United Kingdom 176; France 1; New Zealand 1.
Semimanufactures	5,199	4,150	United States 1,961; United Kingdom 588; New Zealand 482.
Antimony metal including alloys, all forms	26	117	United Kingdom 60; China, mainland, 57.
Arsenic trioxide and pentoxide	1,220	908	United Kingdom 401; France 285; Sweden 144.
Beryllium metal including alloys, all forms value	$2,000	$38,000	United States $20,000; Japan $17,000.
Bismuth metal including alloys, all forms	17	18	West Germany 7; United Kingdom 6; Japan 3.
Chromium:			
Chromite	6,850	13,466	Philippines 10,759; Republic of South Africa 1,709; United States 500.
Oxide, hydroxide, trioxide	866	737	U.S.S.R. 311; United States 220; West Germany 195.
Metal including alloys, all forms	63	26	Mainly from Japan.
Cobalt:			
Oxide and hydroxide	6	7	Canada 5; United States 2.
Metal including alloys, all forms	32	48	United Kingdom 27; Belgium-Luxembourg 17; United States 3.
Copper:			
Ore and concentrate	3	355	Papua New Guinea 350; New Caledonia 5.
Copper sulfate	4,052	197	United Kingdom 155; New Zealand 39.
Metal including alloys:			
Scrap:			
Unalloyed	541	329	New Zealand 198; Papua New Guinea 59; Indonesia 16.
Alloyed	520	458	United Kingdom 200; New Zealand 163; Papua New Guinea 77.
Unwrought	517	204	Papua New Guinea 85; Belgium-Luxembourg 28; United Kingdom 23.
Semimanufacturesvalue, thousands	$12,538	$11,218	Japan $3,759; United Kingdom $3,250; United States $1,718.
Gold:			
Ore and concentrate do	$39	$25	Fiji $14; Papua New Guinea $11.
Metal:			
Crude bullion, Au content troy ounces	61,204	44,262	Fiji 38,991; Papua New Guinea 4,952.
Refined bullion do	3,523	7,319	Switzerland 6,023; Hong Kong 592.
Other, including waste and sweepings value, thousands	$1,818	$1,826	Papua New Guinea $952; Italy $265; New Zealand $164.
Iron and steel:			
Ore and concentrate, including roasted pyrite	30,154	27,590	Mainly from Canada.
Metal:			
Scrap	191	659	Papua New Guinea 466; New Zealand 190.
Sponge iron, powder, shot	6,362	6,620	Sweden 2,609; India 1,503; Japan 1,486.
Spiegeleisen	48	60	All from West Germany.
Ferroalloys:			
Powder:			
Ferromanganese	118	191	Japan 164; Brazil 17; France 10.
Other	260	84	Brazil 59; Japan 14; France 3; United Kingdom 3.
Shot:			
Ferrochromium	12,136	12,967	Republic of South Africa 8,950; Sweden 2,865; Japan 750.
Ferromanganese	5,518	966	Japan 935; France 21; West Germany 10.
Ferromolybdenum	170	201	United States 141; United Kingdom 30; Austria 27.
Ferrosilicon	7,664	5,188	Republic of South Africa 2,293; Philippines 1,000; Japan 669.
Ferronickel	24	19	All from New Caledonia.
Other	2,845	1,723	United Kingdom 882; Spain 256; France 193.
Steel, primary forms	671	672	Japan 350; Sweden 113; Philippines 85.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal sources, 1977
METALS —Continued			
Iron and steel —Continued			
Metal —Continued			
Semimanufactures:			
Bars, rods, angles, shapes, sections	71,844	65,521	Japan 52,077; United Kingdom 4,000; Sweden 2,793.
Universals, plates, sheets	208,403	311,292	Japan 254,005; Republic of Korea 36,759; West Germany 10,572.
Hoop and strip	37,027	22,224	Japan 16,809; United Kingdom 2,229; United States 1,172.
Rails and accessories	7,444	1,618	Japan 992; Belgium-Luxembourg 354; West Germany 236.
Wire	12,896	10,970	Japan 7,298; United Kingdom 1,244; France 1,011.
Tubes, pipes, fittings[3]	96,162	118,850	Japan 67,614; United Kingdom 5,925; Republic of Korea 5,349.
Castings and forgings, rough value, thousands	$397	$667	United States $443; United Kingdom $113; Taiwan $86.
Lead:			
Oxides	37	68	Mexico 36; United States 14; Republic of South Africa 10.
Metal, including alloys:			
Scrap	508	202	Singapore 122; United Kingdom 37; Papua New Guinea 23.
Unwrought and semimanufactures	173	254	New Zealand 184; United Kingdom 56; United States 13.
Magnesium metal including alloys, all forms	2,019	1,818	United States 1,196; Norway 512; Canada 83.
Manganese:			
Ore and concentrate:			
Battery grade	1,216	2,657	All from United States.
Metallurgical grade	81	--	
Oxides	1,070	1,456	Japan 1,090; United States 360.
Metal including alloys, all forms	1,308	899	Republic of South Africa 553; Japan 315; France 30.
Mercury 76-pound flasks	1,169	1,389	China, mainland, 790; Spain 340; Sweden 150.
Molybdenum:			
Ore and concentrate	252	314	Canada 148; West Germany 79; United States 49.
Metal including alloys, all forms:			
Wire	11	5	United States 4; United Kingdom 1.
Other value, thousands	$50	$258	West Germany $153; United States $71; Austria $24.
Nickel:			
Matte, speiss, similar materials	2,414	3,465	Canada 3,463; United Kingdom 2.
Metal including alloys:			
Scrap	17	5	All from United States.
Unwrought	1,525	2,352	Canada 2,301; United States 16; Finland 11.
Semimanufactures	989	1,296	United States 325; Japan 229; United Kingdom 169.
Platinum-group metals and silver:			
Ores and concentrates kilograms	434	1	All from Fiji.
Waste and sweepings value, thousands	$491	$656	Hong Kong $580; Singapore $34; New Zealand $29.
Metals including alloys:			
Platinum-group kilograms	23,330	25,124	West Germany 22,484; United Kingdom 1,858.
Silver do	3,261	3,331	France 716; United Kingdom 629; Fiji 387.
Silicon metal	3,876	2,006	Republic of South Africa 1,318; Sweden 317; Italy 96.
Tin:			
Oxides	15	5	United Kingdom 3; West Germany 1; Japan 1.
Metal including alloys:			
Scrap	3	19	All from New Zealand.
Unwrought	20	216	Malaysia 205; Brazil 5; West Germany 5.
Semimanufactures	12	16	United Kingdom 8; United States 7; Canada 1.
Tungsten metal including alloys, all forms	4	6	France 1; West Germany 1; United States 1.
Zinc:			
Ore and concentrate	--	13	All from West Germany.
Oxides	610	981	United States 283; Canada 273; West Germany 246.
Metal including alloys, all forms	803	99	New Zealand 70; United States 25.

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities[1] [2] —Continued

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal sources, 1977
METALS —Continued			
Other:			
Ores and concentrates:			
Of columbium, tantalum, titanium, vanadium, zirconium	19	38	Mainly from United Kingdom.
Of base metals, n.e.s	50	2,219	Philippines 2,000; Republic of South Africa 100; United Kingdom 58.
Ash and residue containing nonferrous metals	1,228	306	New Zealand 253; Fiji 26; United States 24.
Oxides, hydroxides, peroxides of metals n.e.s	718	836	Canada 165; United Kingdom 157; United States 141.
Metals including alloys, all forms:			
Metalloids	2,320	2,299	United Kingdom 917; Canada 883; United States 304.
Alkali, alkaline-earth, rare-earth metals	79	80	United Kingdom 31; West Germany 23; United States 16.
Base metals including alloys, all forms, n.e.s	46	70	United States 30; Japan 23; United Kingdom 10.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	743	630	United States 231; New Zealand 105; West Germany 90.
Grinding and polishing wheels and stones	1,426	1,124	Netherlands 228; Japan 192; United Kingdom 187.
Asbestos	70,731	55,265	Canada 46,839; Republic of South Africa 7,294; United States 923.
Barite and witherite, natural and ground	1,999	875	China, mainland, 753; Indonesia 67; West Germany 55.
Boron materials:			
Crude natural borates	21	6	United States 4.
Oxide and acid	3,572	3,061	United States 3,050; China, mainland, 10.
Cement[4]	49,043	28,729	Japan 13,819; United Kingdom 5,872; Singapore 3,135.
Chalk	8,314	5,091	United Kingdom 3,225; New Zealand 948; France 494; Japan 420.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite	11,751	19,403	United States 18,675; Singapore 661; Indonesia 46.
Fire clay and ball clay	3,260	1,875	United Kingdom 1,482; United States 190; Japan 175.
Andalusite, mullite, dinas earth, kyanite, sillimanite	1,346	539	United States 505; Republic of South Africa 28.
Kaolin (china clay)	2,188	11,075	United States 8,380; Japan 1,500; United Kingdom 1,195.
Other	31,298	24,985	United States 23,878; China, mainland, 502; United Kingdom 315.
Products:			
Refractory (including nonclay brick)[5]	25,582	31,362	Japan 16,829; United Kingdom 5,459; United States 4,088.
Nonrefractory value, thousands	$36,766	$39,654	Japan $18,195; Italy $12,513; United Kingdom $1,375.
Cryolite and chiolite	164	158	Denmark 142; Japan 16.
Diamond:			
Gem, not set or strung carats	91,336	80,990	Israel 26,509; Belgium-Luxembourg 23,755; India 13,357.
Industrial do	326,790	262,479	United Kingdom 171,549; Republic of South Africa 57,541.
Dust do	688,363	571,346	Ireland 264,194; United States 240,069; Republic of South Africa 39,591.
Diatomite and other infusorial earth	6,530	6,619	United States 6,248; Mexico 147; Japan 123.
Feldspar, leucite, nepheline	12,296	12,661	Canada 11,629; Norway 693; China, mainland, 185.
Fertilizer materials:			
Crude:			
Nitrogenous	1,545	2,219	Belgium-Luxembourg 2,074; West Germany 145.
Phosphatic thousand tons	1,329	1,610	Nauru 802; Christmas Island 487; Gilbert and Ellise Islands 279.
Manufactured:			
Nitrogenous	22,230	23,321	Indonesia 9,920; Italy 6,050; Japan 3,725.
Phosphatic, excluding slag	20,676	10,082	United States 10,008; Japan 72.
Potassic	165,471	161,897	Canada 92,849; United States 67,008.
Other, including mixed	49,964	24,995	United States 20,132; West Germany 3,264.

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities[1 2] —Continued

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal sources, 1977
NONMETALS —Continued			
Fertilizer materials —Continued			
Ammonia value	$6,000	$5,000	United States $4,000.
Fluorspar	36,861	26,132	China, mainland, 12,381; Republic of South Africa 11,301; Thailand 2,111.
Graphite, natural	1,330	2,073	Sri Lanka 1,074; China, mainland, 402; Republic of Korea 341.
Gypsum and plasters	1,113	11,745	Japan 10,561; United Kingdom 836; United States 215.
Iodine	18	26	Japan 14; United States 10; Canada 1; Indonesia 1.
Lime value, thousands	$24	$184	Japan $157; United Kingdom $13; Canada $11.
Magnesite	22	6,022	Japan 5,927; United States 66; India 20.
Mica:			
Crude, including splittings and waste	1,186	830	India 383; China, mainland 250; Republic of South Africa 168.
Worked, including agglomerated splittings value, thousands	$377	$318	United States $96; United Kingdom $78; West Germany $74.
Pigments, mineral:			
Natural, crude	1,642	933	United Kingdom 285; Austria 258; West Germany 211.
Iron oxides, processed	10,517	8,563	West Germany 6,664; Spain 778; United Kingdom 647.
Precious and semiprecious stones, except diamond:			
Natural value, thousands	$10,882	$6,812	Thailand $1,417; Hong Kong $806; West Germany $731.
Manufactured do	$340	$404	Switzerland $132; West Germany $108; Austria $56.
Salt	23,369	30,059	Mexico 22,511; United Kingdom 5,381; New Zealand 1,484.
Sodium and potassium compounds, n.e.s.:			
Caustic soda value, thousands	$48,297	$56,192	NA.
Caustic potash and sodic and potassic peroxides	2,486	2,406	Japan 1,316; India 380; West Germany 266.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	2,217	1,923	Italy 1,660; Yugoslavia 84; Portugal 75.
Slate	1,091	1,634	Republic of South Africa 1,128; Italy 296; India 87.
Other	1,862	1,658	Republic of South Africa 1,013; Finland 307; India 167.
Worked value, thousands	$1,887	$2,185	Italy $984; Taiwan $521; Spain $197; United Kingdom $150.
Dolomite	208	39	New Zealand 16; United States 16.
Gravel and crushed rock	13,453	916	Italy 643; United Kingdom 59; New Zealand 54.
Limestone, except dimension thousand tons	1,175	1,320	Japan 1,272; Philippines 48.
Quartz and quartzite	441	283	Sweden 158; West Germany 87.
Sand, excluding metal bearing	551	1,360	Republic of South Africa 514; Sweden 372; United States 253.
Sulfur:			
Elemental:			
Other than colloidal	315,432	475,708	Canada 448,965; Iran 26,399.
Colloidal	90	137	West Germany 53; Netherlands 38; Yugoslavia 22.
Sulfuric acid, including oleum	16	645	Japan 642; United States 2.
Talc, steatite, soapstone, pyrophyllite	265	444	China, mainland, 200; United States 172; Norway 41.
Vermiculite	4,786	1,571	Republic of South Africa 1,274; China, mainland, 282.
Other:			
Crude	583	441	West Germany 116; China, mainland, 90; Japan 88.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture	44	23	New Zealand 12; West Germany 8; Fiji 3.
Slag and ash, n.e.s	73	40	United Kingdom 29; Fiji 9.
Oxides and hydroxides of magnesium, strontium, barium	17,394	7,332	Japan 6,709; United States 473; United Kingdom 84.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s value, thousands	$957	$1,297	United Kingdom $572; United States $500; Japan $92.

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities[1] [2] —Continued

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal sources, 1977
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	787	946	United States 626; Trinidad and Tobago 263; United Kingdom 32.
Carbon black	714	789	United States 481; United Kingdom 157; West Germany 112.
Coal, all types, including briquets	11,733	12,910	Republic of South Africa 12,431; United States 217.
Coke and semicoke	3,753	3,373	All from United States.

COMMODITY REVIEW

METALS

Aluminum, Alumina, and Bauxite.—Australia's bauxite production declined for the first time in 15 years during 1978 but resumed the upward trend in 1979. The decline was attributed to industrial unrest at the mine of one major producer. For some years, Australia has been the world's leading producer of bauxite from mines located at Weipa, Queensland; Gove, Northern Territory; and the Darling Range, Western Australia. Production of alumina, however, increased slightly in both 1978 and 1979 as a result of greater utilization of capacity at three refineries. Full production capacity was reported by Alcoa of Australia Ltd. at Kwinana and Pinjarra, both located in Western Australia, and by Nabalco Pty. Ltd. at Gove. Aluminum production also increased as smelters at Point Henry, Victoria, and Kurri Kurri, New South Wales, operated at full capacity.

The market was buoyant throughout 1979, although some weakness in the demand for alumina was reported in the second half of 1979. The domestic demand for primary metal did not expand as expected, but the smelters were fully operational as export orders improved. Several price increases in 1979 helped producers to offset rising production costs, however, one company reported a drop in profits.

At Weipa, on Cape York Peninsula, Comalco Pty. Ltd. produced about 15% of the Western World's total bauxite output. At Comalco, which is owned 45% by Conzinc Riotinto of Australia Ltd., 45% by Kaiser Aluminum and Chemical Corp. and 10% by the Australian public, output was slightly above that of 1977. Both production of bauxite and shipments from Weipa in 1978 were below the level of 1977 owing to industrial dispute that restricted operations at the docks. In each year, 1978 and 1979, the company shipped about 9 million tons of bauxite to international markets, principally Japan and Europe. The largest single outlet was the Gladstone alumina refinery operated by Queensland Alumina Ltd. (QAL). Comalco supplied the total bauxite demand for QAL, which in 1978 totaled about 4.4 million tons and 5 million tons in 1979. All of Alcoa's bauxite output was converted to alumina at nearby refineries located at Pinjarra and Kwinana, which have a combined annual capacity of 3.4 million tons. Roughly half of Nabalco's bauxite was exported; the remainder was refined to alumina in an adjacent refinery at Gove that has an annual capacity slightly in excess of 1 million tons.

Australia's three aluminum smelters operated at near capacity levels throughout 1978 and 1979, and production increased slightly during both years. Production of primary aluminum by Comalco's smelter, located at Bell Bay, Tasmania, was appreciably higher than that of 1977. This increase resulted from the new potline commissioned in 1978. The annual rated capacities of the three plants were Comalco at Bell Bay, 112,000 tons; Alcoa at Point Henry, 45,000 tons; and Alcan at Kurri Kurri, 45,000 tons. Expansion work on the Alcan plant continued, and in 1979 its capacity increased to 67,900 tons annually.

Prospects for Australia to occupy a more prominent position in the world aluminum smelting industry continued to improve. Higher prices for crude petroleum have made some oil-fired power stations uneconomic as sources of energy for aluminum production. As a result, Australia's extensive coal resources were recognized as having valuable potential for thermal power generation. Consequently, a number of new aluminum smelting ventures, which would use power from coal-fired stations, were under consideration. In early 1978, Comalco decided to proceed with the construction of a 180,000-ton-per-year plant at Gladstone. The project will cost $500 million and was scheduled to be onstream in mid-1982. Nabalco began a feasibility study for a smelter to use alumina from Gove. Alumax Pty. Ltd. was also committed to a feasibility study for a smelter to be built near Newcastle, New South Wales. Alumax planned a production capacity of 200,000 tons annually, bigger than any Australian plant now operating. Alumax is controlled 50% by Alumax of the United States, 45% by Mitsubishi, and 5% by Nippon Steel.

Apart from the smelter developments, Alcoa planned to build a $200 million, 200,000-ton-per-year alumina plant at Wagerup, south of Perth. Nabalco was modifying its Gove alumina plant to produce sandy alumina, for which contracts have already been obtained. The company has also formed a subsidiary to make a study of the feasibility of establishing a smelter in the immediate vicinity of the alumina plant.

Australia has very large resources of bauxite, and production from Comalco's Weipa deposit supplies approximately 15% of the Western World's requirements. The company's proved, probable, and possible ore reserves at the beginning of 1978 comprised 3.1 billion tons, with recoverable bauxite content of 2.5 billion tons. The grade of recoverable bauxite in the 599 million tons of proved reserves ranged from 53% to 56% alumina. The alumina content in the probable reserves was in the range of 48% to 56% alumina.

Copper.—Improvement in copper demand in late 1978 and throughout 1979, coupled with lower than expected world copper production, caused existing and potential Australian producers to review plans for reopening old mines and developing new ones. The first project will probably involve Peko-Wallsend Ltd., which for some time has been examining the feasibility of rebuilding its Tennant Creek copper smelter. A decision to proceed with the $20 million project is expected early in 1980. Consolidated Gold Fields of Australia Ltd. (CGFA) was another producer that expected to resume production, together with Mitsubishi Development Pty. Ltd., at the Gunpowder Mine.

Although the Australian copper industry showed signs of improvement in late 1978 and throughout 1979, overall production in the various sectors during the 2 years was mixed. Mine output in 1978 declined from the 1977 level, but output in 1979 increased significantly above the levels for 1978 and also those of 1977. Both primary smelter production and primary refinery output for the years 1978 and 1979 declined from that of 1977. Mine production by Mount Isa Mines Ltd. (MIM) in Queensland, which supplies about 70% of Australia's output, increased in 1978 and 1979 from that of 1977. However, lower production was reported by Mount Lyell Mining & Railway Co. Ltd., in Tasmania, and Mount Morgan Ltd., in Queensland.

Lower output by both smelters and refineries was attributed to modernization of facilities, at which time operations were reduced and production declined. Production at MIM's refinery at Townsville, Queensland, was interrupted by the modernization of the tankhouse, the first part of which began operating in November 1978. The supply of concentrates to Electrolytic Refining and Smelting's refinery at Port Kembla, New South Wales, was reduced, and the smelter at Tennant Creek, Northern Territory, remained closed throughout 1978 and 1979.

At Mount Isa, the quantity of ore treated in 1978 was slightly above that of 1977. Copper ore production was mainly from the No. 1100 ore body in 1978 and 1979. An important feature was the increased recovery of ore from pillars left to maintain ground stability during initial mining. The success of the pillar recovery operations was attributed to the standing ability of the cement rock fill that was placed in previously mined areas. Approximately 40% of the copper ore extracted was from pillars in 1978, and 60% in 1979. The concentration on pillar mining in largely developed areas of the No. 1100 ore body resulted in a record level of productivity in the mine and the containment of mining costs. A new ore body (No. 1900) was ready for production at the end of 1979.

The Townsville copper refinery produced 139,950 tons of refined copper in 1978, compared with 139,140 in 1977. Output was marginally reduced in the latter half of the year to enable work associated with the $15 million tankhouse modernization program to proceed. Although from mid-1979 copper from Mount Isa was supplied as anode instead of blister, an anode-casting facility was still required at Townsville to enable anode scrap from the refining process to be melted.

Work at the new MIM Hilton Mine in 1978 and 1979 was confined to a continuation of the underground diamond drilling on the No. 10 level. The drilling completed so far indicates that the geological structure of the deposit was considerably more complicated than at Mount Isa. Primary ore reserves on June 30, 1979, were reported at 37 million tons containing 7.7% lead, 9.6% zinc, and 6 troy ounces of silver per ton.

Mount Lyell Mining & Railway Co. milled about 2.0 million tons of ore and produced 71,000 tons of copper concentrate at its Queenstown, Tasmania, plant in 1978. Ore output increased slightly over that of 1977, as production from the two principal sources, Prince Lyell and Cape Horn, increased. The company continued to operate at a loss and received financial assistance from Government sources. During 1978, Government subsidies to Mount Lyell totaled about $3.1 million.

Peko-Wallsend Ltd.'s copper operations at Tennant Creek, Northern Territory, remained closed throughout 1978 and 1979, but plans were being prepared for the recommissioning. The project was in a state of readiness and awaits firm indications of an improved trend in copper prices. One year would be required for recommissioning, as substantial changes were necessary to improve efficiency. However, 10,568 tons of copper concentrate was produced in 1978 and 15,478 in 1979, as a byproduct of mining gold-bismuth ore at Peko-Wallsend's Warrego Mine. The expanded gold ore treatment plant enabled a transfer of all milling and concentrate production to Warrego with consequently greater efficiency and lower cost per ton.

In 1978, Cobar Mines Pty. Ltd., in Cobar, New South Wales, owned by Broken Hill South Ltd. (BH South), treated 517,300 tons of copper ore (1977, 609,600 tons) to yield 29,000 tons of copper concentrate assaying 28.3% copper. The decrease in ore extracted in 1978 compared with 1977 was largely owing to delays in bringing a new open stope into production because of geological conditions that adversely influenced drilling and blasting. The average grade of copper ore treated was 1.7% copper, compared with 1.2% for 1977. The increased metallurgical recovery of copper from the previous year reflected the higher ore grade. The copper concentrate produced in 1978 and 1979, continued to be sold to Electrolytic Refining and Smelting Co.

Kanmantoo Mines Ltd., in Kanmantoo, South Australia, managed by BH South, remained closed throughout 1978 and 1979. Facilities have been maintained on a care-and-maintenance basis since its closure in 1976. Revenue from hire charges on equipment partly offset the cash costs of maintaining the mine site and facilities.

Although several old mines could be reopened in the early 1980's, the most significant copper production may involve new developments, in particular the Olympic Dam project in South Australia and the Benambra deposit in Victoria. Western Mining Corp. (WMC) continued diamond drilling at the Olympic Dam project near Roxby Downs, where about 10 vertical holes intersected an extensive zone of copper and uranium mineralization at about 350 meters below the surface, varying between 10 and 250 meters in thickness and with grades generally between 1.0% and 2.5% copper. The holes were spaced over an area of 1,500 meters by 400 meters. Also, a joint exploration venture by WMC-BP Australia Pty. Ltd. continued work on the massive copper-silver-lead-zinc deposit located near Benambra. The Benambra drill hole assays 3.2% copper, 6.8% lead, 6.5% zinc, and 150 grams of silver per ton. Considerably more drilling will be needed to determine whether the mineralization is part of an economic ore body or merely an isolated lens. If the discovery reaches the development stage, WMC will hold a 51% interest in the Benambra joint venture and BP Australia Pty. Ltd. the remainder.

Output of the principal copper producers in recent years is summarized in the following tabulation:

Table 4.—Australia: Major copper production, by company

(Metric tons)

Facility	Production[1]		
	1977	1978	1979
Mines:			
Mount Isa Mines Ltd	155,945	159,064	160,500
Mount Morgan Ltd	5,586	4,399	5,200
Cobar Mines Pty. Ltd.	5,640	8,153	8,100
Mount Lyell Mining & Railway Co. Ltd	20,394	18,444	18,500
Electrolytic Zinc Co. of Australia Ltd. (EZ Co.)	1,625	1,585	1,625
Peko-Wallsend Ltd	4,443	3,334	3,475
Smelters:[2]			
Mount Isa Mines Ltd	139,110	147,430	152,400
Mount Morgan Ltd	5,420	4,920	5,800
Electrolytic Refining and Smelting Co. of Australia Ltd[3]	14,898	15,721	17,100
Refineries:[4]			
Mount Isa Mines Ltd	139,143	139,948	141,800
Electrolytic Refining and Smelting Co. of Australia Ltd[3]	13,681	13,221	13,140

Gold.—The Australian gold industry improved dramatically during 1978 and 1979 in response to higher metal prices. As a result of the price increases, many companies began reexamining prospects, reopening mines that had closed when operations became uneconomic, and searching for new gold-bearing areas. The announcement by the Treasurer in the Budget speech that the tax exempt income on gold production would continue, was also of considerable assistance to Australia's gold producers.

The Telfer Mine in the Paterson Range in Western Australia operated throughout 1978 and 1979. The open pit project owned by Newmont Pyt. Ltd. and BHP, mined about 4.5 million tons of ore, averaging 0.28 troy ounce of gold per ton in 1979. The ore was completely oxidized, and the gold occurred as descrete particles of varying sizes but mostly as fine grain. The ore was partially free milling, and up to 40% of the gold was recoverable by a gravity process. The remainder was recovered by conventional cyanide leaching. The Telfer ranks as one of the most important gold producers in Australia.

Kalgoorlie Mining Associates (Kalgoorlie Lake View Pty. Ltd.-Homestake Gold Ltd.) continued to operate the Mount Charlotte Mine at Kalgoorlie. The company began a rehabilitation program involving repairs and additions to the treatment plant at Fimiston and the installation of a crushing section. Kalgoorlie Mining Associates expects to reduce the cost of producing gold by about $10 per ounce when the program is completed.

Central Norseman Gold Corp. Ltd., near Kalgoorlie, remained Australia's largest gold producer. The company produced approximately 123,000 troy ounces in 1979. Development work continued on the No. 4 and No. 5 levels of the North Royal Mine, which was the main source of the gold produced. The company was also producing gold from an open pit operation near the surface. Central Norseman encountered encouraging diamond-drill intersections in the program to extend its ore reserves at the mine. Ore reserves were estimated at 350,000 tons averaging 0.53 troy ounce of gold per ton in 1979.

The Warrego Mine (formerly a copper

mine), operated by Peko-Wallsend Ltd., was the only producing gold mine at Tennant Creek. The Warrego copper concentrator was modified to treat Warrego gold ore. During the year, 202,500 tons of gold ore was treated assaying 0.58 troy ounce per ton, with gold recoveries of 91.60%. This ore yielded 81,100 troy ounces of gold bullion in 1978. In 1979, the company treated 248,142 tons of ore yielding 108,906 troy ounces of gold.

Wattle Gully Gold Mines NL plans to reopen its Chewton gold mine near Castlemaine, Victoria. The company, which has been treating tailings at the mine for the past 12 months, has applied to the Victorian Department of Minerals and Energy for permission to reopen. When the mine closed it was treating 200 tons of ore per week and producing grades of over 1 troy ounce per ton.

Production of refined gold from all sources was some 650,000 troy ounces in 1979. Newly won gold of domestic origin accounted for 77% of the total, and refined gold produced from imported crude bullion and domestic and imported scrap accounted for the remainder. The Perth Mint, which refines crude gold bullion from gold mines in Western Australia and the Northern Territory, as well as some bullion and scrap of overseas origin, was the largest domestic refinery of gold. Other gold refiners were Matthey Garrett Ltd. in Sydney and Engelhard Industries Ltd. in Melbourne. Most of the crude bullion from Fiji and Papua New Guinea was refined by Matthey Garrett. Base metal refineries were the only other source of refined gold. In 1979, the Electrolytic Refining and Smelting Co. recovered some 11,200 troy ounces of gold from tankhouse sludges resulting from the electrolytic refining of copper at Port Kembla, and Broken Hill Associated Smelters Pty. Ltd. recovered about 6,400 troy ounces from lead concentrates refined at Port Pirie, South Australia.

The principal gold producers and quantities recovered during 1978 and 1979 were as follows:

Table 5.—Australia: Major gold production, by company

(Troy ounces)

Company	Production 1978	Production 1979
Central Norseman Gold Corporation NL	120,000	123,000
Kalgoorlie Lake View Pty. Ltd	102,600	105,000
Newmont Pty. Ltd	141,000	130,000
Peko-Wallsend Ltd	134,590	136,600

Iron and Steel.—Domestic production of iron ore decreased in 1978, compared with 1977, reflecting reduced world demand and considerable accumulation of stocks by both producers and consumers. Production in 1979 returned to the 1977 level but was below the record output of 1975. Demand for steel also remained depressed in both 1978 and 1979, but a slight improvement was reported in the domestic market. The continuing recession in the Japanese steel industry affected the demand for raw materials, and Australian producers of iron ore experienced difficulty in obtaining contracts. Negotiations between Australian producers and Japanese consumers over prices in some contracts were not concluded. However, European prices for 1978 and 1979 shipments on a c.i.f. basis were reported to have been fixed at between 10% and 16% below those of 1977.

As in recent years, most of the iron ore was produced in the Pilbara region in northwest Western Australia. In this area, five major companies produced about 90% of Australia's total iron ore output: Hamersley Iron Pty. Ltd. (Mount Tom Price and Paraburdoo), Mount Newman Iron Ore Pty. Ltd. (Whaleback Hill), Cliffs Western Australian Mining Co. Pty. Ltd. (Robe River), Goldsworthy Mining Ltd. (Mount Goldsworthy, Shay Gap, Sunrise Hill), and Dampier Mining Co. Ltd. (Koolan Island and Yampi Sound). In addition to the Pilbara region, iron ore was mined at Kollyanobbing by Dampier for use in the Kwinana blast furnace. In South Australia, Broken Hill Pty. Ltd. Co. (BHP) produced ore from the Middleback Ranges for steel plants in South Australia (Whyalla) and in New South Wales (Newcastle and Port Kembla). In a relatively small project, the iron ore at Savage River, Tasmania, was slurried and pumped to a pelletizing plant at Port Latta for shipment to Japan.

Production of iron ore by Hammersley in 1978 decreased some 17% from that of 1977. The decline was attributed to a drop in demand by Japanese steel producers and increased industrial disruption during 1978.

Again in 1979, operations at Hamersley's mines and Dampier port and processing facilities were suspended for several weeks as a result of strike action by eight unions over a series of workers' claims. Recovery of saleable ore from material mined at Mount Tom Price declined from 59% to 50% during 1978. Salable ore production at Mount Tom Price was 16 million tons compared with 21 million tons in 1977. Production consisted of 8.3 million tons of high-grade lump, 7.4 million tons of high-grade fines, and 400,000 tons of low-grade fines. Salable ore production at Paraburdoo in 1978 was 13.2 million tons compared with 13.7 million in 1977. Production consisted of 6.1 million tons of high-grade lump and 7.1 million tons of high-grade fines. Material mined totaled 26.4 million tons. Total material movement in the mine was 32.9 million tons in 1978. Progress was made during the lower levels of production to increase the proportion of Paraburdoo ore in total production from the 39% obtained in 1977 to 45% in 1978. This would extend the life of the Mount Tom Price ore body, which was less than the expected life for Paraburdoo. Also, Hamersley spent $350 million on a project in 1978 and 1979 to expand the beneficiation plant, which upgrades low-grade ore (about 59% Fe) to marketable high-grade ore (about 64% Fe). Production capacity was increased by 6 million tons per year to 46 million in late 1979.

Production in 1978 and 1979 by Mount Newman Consortium, a joint venture operated by Mount Newman Mining Co. Pty. Ltd., remained at about the same level as that of 1977. Sales for 1978 totaled 32 million tons and quantity of ore in the stockpile totaled 2 million tons. Mount Newman was constructing a heavy-media beneficiation plant which was completed in mid-1979. Total cost of the plant and associated infrastructure was about $100 million. The plant recovers ore from contaminated waste material and provides Mount Newman with greater flexibility to increase capacity at a later date.

Goldsworthy Mining Ltd. produced 3 million tons of iron ore in 1978, 50% less than that of 1977. Production in 1979 dropped to approximately 1.3 million tons. Production came from the company's mines at Shay Gap and Sunrise Hill, which are located 113 kilometers and 180 kilometers, respectively, east of Port Hedland in Western Australia. Goldsworthy plans to cease production in the Pilbara area by mid-1981. With no contract for its 700 million tons of Area C iron ore, Pilbara's Goldsworthy project will stop when its existing ore reserves and contracts run out. The company had only 13.3 million tons of iron ore reserves and contracted to supply 5.5 million tons annually for the next 2 years.

The principal Australian iron ore producers and their output in 1978 and 1979 were as follows, in thousand tons:

Table 6.—Australia: Major iron ore production, by company

Company	Location	Products	Output	
			1978	1979
Hammersley Iron Pty. Ltd	Western Australia	Lump and pellets	29,445	33,000
Mount Newman Mining Co. Pty. Ltd	do	Lump	29,160	35,000
Broken Hill Pty. Co. Ltd	South Australia	Lump and pellets	3,319	4,000
Do	Western Australia	Lump	1,684	2,000
Goldsworthy Mining Ltd	do	do	3,000	1,500

Australian reserves of iron ore were estimated at 35 billion tons, consisting of 25 billion tons of hematite, with 54% or more iron content, and 10 billion tons of limonite, with 50% or more iron content. Most of Australia's reserves occur in the Pilbara region, which accounted for over 90% of production in 1979. New mines in the region, however, are unlikely unless iron ore prices rise substantially, since none of the three planned projects was economically viable at present prices. The Japanese steel industry will not negotiate any contracts with new Western Australia iron ore companies until the early 1980's.

The BHP Co. remained the only steelproducer in Australia, with plants at Newcastle and Port Kembla in New South Wales, Whyalla in South Australia, and Kwinana in Western Australia. Production of raw steel in 1978 totaled 7.4 million tons compared with 7.5 million tons in 1977. Shipments of 3.7 million tons of steel to the domestic market in 1978 was slightly above that of 1977. Total capacity was about 9 million tons per year. Despite idle capacity, the company was expanding capacity to follow estimated future market requirements. Major work completed in 1978 at Newcastle included the No. 5 ore unloader. Projects still in progress in 1979 included the No. 5 coke ovens battery and modifications to the coal cleaning plant and steelmaking shop. At Port Kembla, work on the continuous slab caster with vacuum degasser, and modifications to the No. 5 blast furnace were in progress during 1979. These installations represent large investments in the steel industry and in each case provide the benefits of the latest technology, which should result in quality improvements. Work was also continuing on modifications of the basic oxygen steel making plant. At Whyalla, work was continuing on the construction of the coke ovens extensions, and relining of the No. 1 blast furnace was completed in 1979. Installation of the coil plate processing line adjacent to the new hot-strip mill of John Lysaght (Australia) Ltd. was continuing at Westernport, Victoria.

Conzinc Riotinto of Australia and Korf Stahl AG of West Germany were studying the feasibility of establishing a 200,000-ton steel mill at Geelong, Victoria. The mill would have two electric furnaces and use scrap metal as raw material.

Lead and Zinc.—In 1978, mine production of lead decreased from the 1977 level. Increased production at Broken Hill and the startup of the Woodlawn Mine were offset by declining output at Mount Isa owing to the mining of lower grade ores. In 1979, however, a further increase in output from the new Woodlawn Mine, an increase in production at Mount Isa, and recovery to a more normal level of output from mines at Broken Hill resulted in higher output for both lead and zinc. The sole domestic producer of primary refined lead, Broken Hill Associated Smelters (BHAS) at Port Pirie, operated at full capacity throughout the second half of the year, and primary production increased by 12%.

Mine production of zinc rose significantly in 1979, compared with that of the previous 2 years. Output by two Broken Hill mines and new production at Woodlawn more than offset lower output at the North Broken Hill Mine, where damages and industrial disputes led to a substantial decline in production. Output of primary refined zinc at all three refineries in 1978 and 1979 was higher than that of 1977. Contrary to worldwide trends, exports of refined zinc increased substantially as a result of increased sales in the South East Asian market.

MIM was Australia's largest single producer of lead and zinc. About 2.3 million tons of lead-zinc ore was mined in 1978 containing 6.4% lead and 6.5% zinc. Mining was concentrated between the 13 level (670 meters) and 15 level (730 meters). The Mount Isa mining methods of cut and fill and open stoping were modified to achieve greater ore recovery and better utilization of workers and equipment.

A major development in 1978 at Mount Isa was the completion of the 270-meter lead smelter stack, which would greatly reduce the need for curtailments and shutdowns to maintain air quality. Drilling of the lead-zinc mineralized area continued in the northern part of the Mount Isa Mine throughout 1979 and some drilling was done in the footwall region. The drilling in the latter area was quite deep, about 1,100 meters below the surface. As a result of the drilling, over 1 million tons of ore was added to the zinc and lead reserves.

Exploration and study of the McArthur River zinc-lead deposit in the Northern Territory by MIM continued. The work involved the operation of a 50-ton-per-day pilot plant and support facilities. The pilot plant results were being used in a major overall feasibility study, of which the pilot plant operation was a part. Also, geological and metallurgical investigations related to McArthur mineralization continued. Seventy people were employed at the site.

In 1979, mine output by Australian Mining and Smelting Ltd.'s (AM&S) two subsidiaries, Zinc Corp. Ltd. and New Broken Hill Consolidated Ltd. (NBHC), increased from the levels of 1977 and 1978. In 1978, lower output was attributed to labor problems, which resulted in two work stoppages. One, which lasted 8 days, was confined to a small group of tradespersons, and production continued on a reduced basis throughout the strike. The second involved a complete loss of production for 2 days. The NBHC haulage shaft was unavailable for 9 operating days in the second quarter following a mishap. These factors, coupled with the lower overall grades of ore mined in 1978, resulted in lower lead and zinc concentrate production. Both mines operated throughout 1979 without work stoppages.

A consortium, consisting of Conzinc Riotinto of Australia, St. Joe Minerals Corp., and Phelps Dodge Corp. of the United States, formally inaugurated the Woodlawn Mine project in December 1978. Following a commissioning period, the open pit mine, located at Woodlawn, New South Wales, attained planned production levels of copper, zinc, and lead concentrates in early 1979. When operating at capacity, the mill would produce about 120,000 tons of zinc concentrates, 40,000 tons of lead concentrates, and 35,000 tons of copper concentrates annually. Output would be divided among the three joint venture partners, each of which would arrange its own sales. Diamond drilling in 1979 revealed ore reserves of 10 million tons, averaging 12% zinc, 4.5% lead, 1.8% copper, and 1.8 troy ounces of silver per ton.

The BHAS lead plant operated at near capacity for most of 1978 and 1979, with increased lead output each year. The company continues to pursue new development programs and a Linde air separation plant was commissioned in June 1978 to supply oxygen to the blast furnaces. Acid plant modifications and extensions were completed in early 1979. Also, work commenced in 1979 on the extensions to the lead refinery and construction of a Kroll-Betterton debismuthizing plant for producing low-bismuth lead. The No. 2 blast furnace began operating in August 1978, and the use of oxygen in the furnace resulted in a significant increase in lead production. The company, in conjunction with the Commonwealth Scientific Industrial Research Organization (CSIRO), was also examining a reflux refining process for lead. Construction of a 1-ton-per-hour pilot plant was completed, which includes a reflux column, crystallizing chamber, and a process control computer.

EZ Industries Ltd. operated three mines, Rosebery, Hercules, and Farrell, all in Tasmania. The Rosebery and Hercules are zinc-lead-copper deposits in association with gold, silver, and pyrite. The Farrell Mine is a silver, lead, and zinc vein deposit. The combined output of ore mined totaled some 610,000 tons in 1978, slightly more than that in 1977. The Rosebery Mine, where substantial improvements were made in 1977, was the main reason for the rise in production. The average grade of ore production from all mines was 12.3% zinc, 3.8% lead, and 5 troy ounces of silver per ton. Products of the concentrating mill were zinc, lead, copper, silver, gold, and pyrite concentrates, which were railed to the port of Burnie. There were 11 line-haul locomotives and 69 bulk wagons of 44-ton capacity on the railway. Traffic on the line exceeded 600,000 tons per year.

The principal lead and zinc companies and quantities produced during 1978 were as follows:

Table 7.—Australia: Lead-zinc production, by company

(Metric tons)

Mine	1977		1978		1979	
	Lead	Zinc	Lead	Zinc	Lead	Zinc
North Broken Hill Ltd	52,877	39,442	51,080	38,685	52,000	39,400
Zinc Corporation Ltd	86,240	56,700	79,400	61,000	80,000	63,000
New Broken Hill Consolidated Ltd	78,240	137,200	61,600	121,000	64,000	127,000
Mount Isa Mines Ltd	131,390	101,027	127,600	105,540	130,000	109,000
Electrolytic Zinc Co. of Australasia Ltd. (Read-Rosebery)	20,459	70,341	21,500	70,850	22,300	69,700

Manganese Ore.—Domestic production of manganese ore in 1978 and again in 1979 was less than that for 1977, in line with decreased steel output. Consumer stocks of manganese ore also rose substantially during both 1978 and 1979. More than 90% of the output was supplied by the Groote Eylandt Mining Co. Pty. Ltd. (GEMCO), a subsidiary of BHP.

GEMCO shipped 1.2 million tons of manganese ore from its operations in the Northern Territory in 1978. The largest tonnage (600,000 tons) went to Japan. About 230,000 tons was shipped to Europe, 110,000 tons to the United States, and 40,000 tons to the Republic of Korea. The remaining 220,000 tons was domestically consumed and processed by the Bell Bay plant, operated by Tasmanian Electro Metallurgical Co. Pty. Ltd. (TEMCO), a subsidiary of BHP. The plant produced some 103,000 tons of ferroalloys. Although this was 8% higher than last year, it was well below plant capacity owing to limited demand. Approximately 25,000 tons of ferroalloys was exported in 1978, compared with 37,000 tons in 1977. About 1.3 million tons of manganese ore was shipped in 1979, mostly to Japan, Europe, the United States, and the Republic of Korea.

Most ore for export was sold on a contract basis, and prices are negotiated annually between buyer and seller. Prices of high-grade lump ore from Groote Eylandt remained at $65.28 per ton f.o.b. during 1978 and 1979. Low-grade ore reportedly remained at the $1.28 per ton unit of contained manganese f.o.b. quoted for 1977.

Australian manganese reserves were estimated at about 889 million tons in 1979, the main part of which was on Groote Eylandt. The remainder was located principally in the east Pilbara and Peak Hill regions of Western Australia and at Pernatty Lagoon in South Australia. Known deposits in the Northern Territory were subeconomic. Large secondary enrichment deposits along the outcrop of the Marra Mamba iron formation in the Pilbara were being evaluated. These deposits were low in silica and consisted of about equal proportions of high-grade ore (40% manganese) and lower grade ores suitable for beneficiation.

Nickel.—The international market for nickel was seriously affected by a buildup of stock and instability of prices in 1978 and 1979, which led to some adjustments in the pattern of production in Australia. Although Australia remained the world's fourth largest producer of nickel, production declined significantly in both 1978 and 1979. Output from the new $100 million Agnew mine was not sufficient to offset the loss resulting from the closure of the Redross and Windarra mines in 1978. Sulfide-based mines in Western Australia accounted for 60% of total production, with the remainder coming from the Greenvale lateritic mine in Queensland.

At the end of 1979, the Kambalda Mine at Kalgoorlie was still the principal nickel producer, accounting for more than 50% of the Australian production. The Greenvale operation in Queensland was the next largest. The Nepian, Spargoville, and Agnew mines in Western Australia together produced less than 10% of the Australian total. Suspension of mining at Windarra and Redross during 1978 represented a loss of about 11,000 tons of nickel annually. It was announced that the Spargoville Mine would close in early 1980 unless there is a sustained upturn in market conditions.

In 1978, WMC treated 1.4 million tons of ore and produced 316,800 tons of concentrate containing 37,332 tons of nickel. Sources of nickel concentrate during the year were mining operations at Kambalda, Windarra, Scotia, and Carr Boyd. In February 1978, production from the open pit mine at South Windarra was suspended, and underground production at Mount Windarra ceased in June. At the beginning of 1979, WMC had seven production shafts and declines in operation. Deepening of four declines and several shaft sinkings continued throughout 1979. Declines were advanced on the Jan, Hunt, Ken, and Gellatly shoots. Jan shaft was completed to a depth of 620 meters, and underground development continued. Sinking of Long shaft continued to a depth of 863 meters. Work on Victor shaft was suspended in 1979. Total development, including raise drilling, during 1978 and 1979 was 25,000 meters.

In addition to operating the Kambalda and Scotia mines and managing the Windarra Mine, in which it has 50% interest, WMC owned the smelter at Kalgoorlie and the refinery at Kwinana. The company treated ore and concentrates from other mines on a toll basis and also smelted the half of Windarra production owned by the Shell Co. of Australia Ltd. Throughput for 1978 of 304,000 tons of concentrate was the highest to date. Expansion of the smelter capacity to 450,000 tons annually (concentrate) was completed in early 1979.

Construction of the Agnew nickel project, which was a joint venture of Western Selcast Pty. Ltd. and MIM Holding Ltd., was completed in June 1978. The plant, located near Leinster, Western Australia, was expected to produce 10,000 tons of nickel in concentrate annually. The concentrator commenced treatment of development ore in May 1979. The plant operated at reduced capacity until general stope production in the mine began in the first quarter of 1979. Production at capacity level was achieved during the fourth quarter of 1979. Sinking of the shaft to explore the major No. 2 ore body reached 221 meters below the surface by June 30. The total planned depth was 910 meters. The project contains a minimum of 46 million tons of sulfide ore averaging 2% nickel.

The Greenvale Mine in Queensland, owned equally by Metals Exploration Ltd. and Freeport of Australia Inc., was operated at about 70% of designed capacity during 1978 and 1979. The operation, which treats (acid leach) lateritic ore, has overcome most of the early technical problems, but serious financial difficulties persist. Operations have generated a positive cashflow, but this has been totally inadequate to meet the cost of servicing the development loans. Some relief was obtained when the financiers agreed to a deferment of interest payments, but the financial viability of the whole project remains in doubt.

Some exploration work for nickel was in progress, mainly in Western Australia. At Forrestania, Western Australia, Endeavor Oil Company N.L. continued exploration at its Digger Rocks prospect. Also, Anglo American, Australian Aquitaine Petroleum Pty. Ltd., BHP, and Kennecott Copper Corp. continued exploring in the Kimberley Range of Western Australia.

Silver.—Most silver was produced as a byproduct of lead-zinc mining with gold and gold-copper mining making a contribution. Total silver production in 1979 was slightly above the 1978 output but below that for 1977. More than 85% of the output came from mines in Mount Isa, and Broken Hill. Silver was also produced as a byproduct of copper mining at Tennant Creek, Mount Morgan, Cobar, Woodlawn, and Mount Lyell.

MIM remained Australia's largest producer of silver. In 1978, about 2.3 million tons of lead-zinc ore, averaging 6.9 troy ounces of silver per ton, was treated to produce 10.3 million troy ounces of silver in concentrates. Mount Isa's output increased slightly to 10.4 million troy ounces in 1979. About 87% of the silver was recovered from lead concentrates and the remainder from zinc and copper concentrates. The lead concentrates were smelted to lead bullion at Mount Isa and exported to the company's lead refinery at Northfleet, United Kingdom, where the silver metal was recovered. Over 70% of the zinc concentrate was exported; the remaining 25% was shipped to the zinc refinery at Risdon, Tasmania. Silver in copper and lead residues from the electrolytic tankhouse slimes from the Townsville copper refinery were either recovered by Electrolytic Refining and Smelting Co. or exported.

The Broken Hill area remained Australia's second largest source of silver in 1978 and 1979. Production of silver from the lead-zinc concentrates in 1978 by several companies declined because of strikes, the need for plant repairs, and a lower overall grade of ore mined. With the absence of strikes in the lead-zinc industry during 1979, output of silver advanced. More ore was mined from the zinc-rich lodes, which contained about 3 troy ounces of silver per ton, compared with 7 troy ounces per ton in the lead-rich ore bodies. Most of the silver produced at Broken Hill was contained in lead concentrates which were treated at the BHAS's smelting and refining plant at Port Pirie.

At Mount Morgan, Queensland, silver was recovered in blister copper produced from open pit copper-gold ore. In 1978, production totaled 35,123 troy ounces, to which the Warrego Mine at Tennant Creek contributed 12,210 troy ounces.

EZ Co. produced silver as a byproduct of copper-lead-zinc mining at Rosebery. In 1978, the company treated about 550,000 tons of Rosebery ore, 66,000 tons of Hercules ore, and 13,500 tons of dump material. The average silver grade of the complex copper-lead-silver-gold ore treated was 4 troy ounces per ton, the same as the grade in 1977. The ore yielded 132,000 tons of zinc concentrate containing 481,000 troy ounces of silver, 14,000 tons of lead concentrate containing 400,000 troy ounces of silver, and 27,000 tons of copper concentrate containing 1.6 million troy ounces of silver.

Silver produced by EZ Co. has been stable in recent years, and output in 1979 was virtually the same as that in previous years. Lead and copper concentrates were exported, and the silver in the zinc concentrate, which was treated at the Risdon refinery, was recovered in copper-lead-zinc residues.

About 80% of all silver exported in 1978 and 1979 was contained in lead bullion, lead, zinc, and copper concentrates, blister copper, and various slags, mattes, and residues. The remainder was exported as refined silver and mint bullion.

Principal producers of silver and output, in thousand troy ounces, during 1977, 1978, and 1979, were as follows:

Table 8.—Australia: Major silver production, by company

Company	1977	1978	1979
Electrolytic Zinc Co. of Australasia Ltd	2,466	2,481	2,470
Mount Isa Mines Ltd	10,434	10,283	10,400
New Broken Hill Consolidated Ltd	1,820	2,163	2,200
North Broken Hill Ltd	2,700	2,168	2,400
Zinc Corporation Ltd	1,740	1,155	1,300

Tin.—Decontrol of the tin market in 1976 by the International Tin Council resulted in a rapid escalation of prices that existed throughout 1978 and 1979. These conditions encouraged the Abminico NL group (Aberfoyle Tin NL, Cleveland Tin NL, and Ardlethan Tin NL mines) and Renison Ltd. to significantly increase production in 1978 and 1979. Although the continuing strength of world tin prices in 1978 and 1979 brought prosperity to Australian tin miners, the Australian Tin Producers' Association (ATPA) expressed concern that high prices and shortage of supplies could encourage technical developments to reduce the use of tin. ATPA indicated that an immediate solution would be the release of tin from the U.S. stockpile. The Association stated that shortages must be met for tin prices to remain at a level at which large-scale substitution would not occur.

Renison Ltd., located in Renison, Tasmania, was Australia's principal tin producer and remained the world's largest tin producer from a hard-rock underground mining operation. Ore produced from Renison's mining operations in 1978 increased 9% to 597,700 tons compared with that of 1977. The concentrator operations were satisfactory throughout the year. Ore throughput was increased by 35,400 tons (6%), and tin in concentrate was 580 tons (12%) higher than in the previous year. The leaching plant, commissioned in late 1977 to treat acid-soluable gangue minerals from low-grade flotation concentrate, also operated throughout 1978 and 1979. The commissioning of the leaching plant permitted the closure of the Vanner section of the gravity plant, and tin formerly recovered in that section was recovered by flotation. Renison announced plans in 1979 to spend $22 million on a major mine expansion program. Mine production would be increased 42% from 600,000 to 850,000 tons annually. Work began in March 1979 and would be finished by the end of 1980. The production increase would precede construction of a smelter to handle ore from the Bell Hill Mine in northwestern Tasmania. Australia had one tin smelter in 1979, which was operated at Alexandria, New South Wales, by Associated Tin Smelters Pty. Ltd. (ATS). The Renison Mine provided over 50% of the plant's raw material. Renison recently renegotiated a new contract with ATS that would expire at the end of the production expansion phase. Renison's combined proved and probable reserves increased 15% to over 1.2 billion tons in 1979, but the grade dropped from 1.19% tin to 1.14% tin. The increase in tonnage and reduction in grade was largely a result of the addition of 2.1 million tons of ore averaging 1.06% tin added to reserves during 1979.

The Abminico NL group increased production approximately 15% compared with that of 1977, but performance of individual mines varied. The Ardlethan Mine, in New South Wales, produced 1,715 tons of concentrate in 1978, up from 1,110 tons in 1977. Output by Cleveland Mine, at Luina, Tasmania, dropped to 1,238 tons from 1,386 tons in 1977, and output at the Aberfoyle and Storeys Creek mines dropped from 120 tons to 107 tons in 1978.

The Cleveland Mine continued to suffer throughout 1978 and 1979, as it did in the last half of 1977, from excessive wallrock dilution and multiple faulting. Tin metal in concentrates produced in 1979 was 11% lower than in 1977. Mill throughput in 1979 was also marginally lower, but metal recoveries improved significantly. The Ardlethan Mine improvement began in the last half of 1977, and continued throughout 1978 and 1979. Production of tin in concentrates increased by 54% in 1978 over the 1977 level. Head grade and metallurgical recovery were both significantly improved over the previous year's figures. The Aberfoyle and Storeys Creek mining operations in 1978 and 1979 continued to be heavily dependent on the extraction of remnant ore blocks at both mines. Mill throughput at 36,600 tons in 1978 was 10% lower than in 1977 owing to limited availability of ore and a 3-week industrial stoppage.

ATS, operating at Alexandria, New South Wales, was the only domestic producer of primary refined tin. Production in 1978 was 5,129 tons, about 6% less than in 1977. The smelter is a joint venture of O. T. Lempriere and Co. Ltd. and Australian Iron and Steel Pty. Ltd. Production capacity of the smelter was originally rated at 15,000 tons annually of concentrates, equivalent to about 10,000 tons of tin metal per year, but the low average grade of concentrates available to the smelter reduced its effective capacity to about 7,000 tons per year.

Titanium and Zirconium.—In 1978 and 1979, the world market for mineral sands concentrates was generally weak, prices low, and production erratic. Ilmenite production increased slightly in 1978 but declined in 1979. Production of rutile rose in 1978 and 1979, but zirconium declined in 1978 and rose in 1979. Demand for rare-earth oxides in the United States and Europe enabled the upward trend in monazite concentrates production to continue in 1978 and 1979. Virtually all the rutile, zircon, and monazite output was exported, along with about 50% of the ilmenite. The remainder of ilmenite was consumed within Australia for the production of titanium dioxide pigments and for the production of synthetic rutile. The principal destinations for the products were Western Europe, Japan, and the United States.

Australia produces over 90% of the world's natural rutile, about 80% of the zircon, 70% of the monazite, and over 25% of the world's ilmenite. The industry was divided, generally, into three groups, the east coast producers of rutile and zircon, the west coast producers of ilmenite and zircon, and the new west coast producer of rutile, zircon, and ilmenite. On the east coast, four main groups (Associated Minerals Consolidated Ltd., Consolidated Rutile Ltd., Mineral Deposits Ltd., and Rutile & Zircon Mines Ltd.) accounted for most of the output. In 1978, Associated Minerals Consolidated Ltd. produced about 100,000 tons of rutile and 80,000 tons of zircon from plants in New South Wales and Queensland. Consolidate Rutile Ltd. produced approximately 25,000 tons of rutile in 1978 but has expanded plant facilities and expects to produce about 60,000 tons of rutile and 45,000 tons of zircon in 1979. Production by Mineral Deposits Ltd. totaled roughly 45,000 tons each for both rutile and zircon. Combined production by two plants operated by Rutile & Zircon Mines Ltd. totaled 58,000 tons of zircon and 45,000 tons of rutile in 1978.

On the west coast, five producers (Western Titanium Ltd., Allied Eneabba Pty. Ltd., Jennings Mining Ltd., Westralian Sands Ltd., and Cable Sands Ltd.) supplied most of the output of mineral sands in 1978 and 1979. Westralian Sands produced approximately 350,000 tons of sulfide-grade ilmenite. The other main products were 40,000 tons of zircon, 15,000 tons of leucoxene, and 3,000 tons of monazite. Cable Sands output consisted of 140,000 tons of ilmenite, 5,000 tons of leucoxene, 16,000 tons of zircon, and around 1,000 tons of monazite. Small quantities of xenotime and garnet were also produced. Western Titanium Ltd.'s main product continued to be ilmenite. Production totaled about 250,000 tons in 1978. Other products included 25,000 tons of zircon, 5,000 tons of leucoxene, and about 1,000 tons of monazite. At Allied Eneabba Pty. Ltd., ilmenite, zircon, and rutile, totaling 250,000 tons, 120,000 tons, and 50,000 tons, respectively, was produced. Production at Jennings was reduced considerably to suit the difficult market conditions. The company's yearly output for 1978 and 1979 totaled about 10,000 tons of rutile, 10,000 tons of zircon, and 45,000 tons of ilmenite.

One reason for the involvement of so few companies in Australia's mineral sands operations was attributed to the declining grade of ore reserves. The high-grade deposits have been mined out, and the mining companies have moved toward lower grade reserves, which require larger and more expensive processing facilities. Also, large areas containing known reserves of rutile and zircon have been precluded from mining by their being incorporated into new national parks. Australia's Bureau of Mineral Resources estimates that over 40% of identifiable economic resources of zircon and rutile on the east coast was unavailable for mining because of environmental considerations.

At yearend 1979, proven and probable reserves of heavy mineral sands totaled about 68 million tons in western Australia, 20 million tons in Queensland, and 20 million tons in New South Wales. The content of heavy minerals ranged from 1% near Newcastle, New South Wales, to 80% at Eneabba, Western Australia. Most producers continued exploration in 1978 and 1979, and most of the activity was in Western Australia.

NONMETALS

Phosphate Rock.—Australia's first company to produce and export phosphate rock ceased operations in June 1978. The decision by BH South Ltd. to close down the operation of its subsidiary, Queensland Phosphate Ltd. at Duchess, came after both the Australian Government and the Queensland State government refused financial assistance to the company. When Duchess came into production in 1975, it was unable to establish long-term export sales contracts so essential to its economic viability and consistently operated well below its design capacity of 2 million tons annually. The country most likely to benefit most from the mine closure is Nauru, the dominant supplier to the Australian market. The Australian fertilizer industry consumes about 2.4 million tons of phosphate rock annually.

Domestically, Queensland Phosphate had to compete with rock imported from British Phosphate Commission's operations in Nauru, Banaba, and Christmas Islands. Characteristics of rock from these three different sources were different, and require slightly different processing methods. The Queensland Phosphate rock had a high silica content, was difficult to grind, and caused adverse chemical reactions in domestic manufacturing plants. The Australian fertilizer manufacturers were unwilling to undertake the necessary capital expenditure in changing from their established source of supply to the Queensland material.

In 1978, Queensland Phosphate produced 250,000 tons of phosphate rock averaging 32.17% P_2O_5. Production came mainly from the southern area where thicker sections of direct-shipping-grade rock gave a more favorable waste-to-ore ratio. A heavier than usual rainfall during the wet season caused a reduction in mine output in January. Haul road washouts and local flooding occurred, but pit flood protection systems prevented runoff water from entering the pits. The performance of the treatment plant steadily improved as operating techniques were refined and minor technical improvements were made. The Townsville facilities processed about 252,000 tons of phosphate rock through the dryer. Shipments during the year totaled roughly 275,000 tons. A total of 200,000 tons was taken by south and east Asian markets, and 60,000 tons was shipped to Australian ports. The major share of export sales was to Japan, Korea, and Malaysia, and deliveries will be made from stockpiles to those markets in 1979. Sales to Australia were mainly for production testing purposes.

A small quantity of phosphate rock, an estimated 11,000 tons in 1978 and 1979, was produced in South Australia. The material was not suitable for superphosphate manufacture because of its high iron and aluminum content and was used directly as fertilizer.

Salt.—In 1978 and 1979, both production and export of salt decreased owing to depressed demand resulting from the downturn in world economy. Five major companies, Texada Mines Ltd., Dampier Salt Ltd., Leslie Salt Co., Lefroy Salt Pty. Ltd., and Shark Bay Salt Pty. Ltd. (all based in Western Australia) produced about 80% of the total domestic output. Producers in South Australia, Victoria, and Queensland supplied the remainder. Production was by solar evaporation from sea water, saline lake water, and underground brines, and salt was also harvested from dry lake beds. Virtually the entire Western Australian output was exported, mainly to Japan; salt produced in Queensland, Victoria, and South Australia was generally for local consumption. Less than 2% of Australia's total output was consumed as table salt.

In Western Australia, production in 1978 and again in 1979 totaled 4.0 million tons of salt, and shipments totaled 3.6 million tons, valued at about $26.2 million in each of the 2 years. Texada Mines Pty. Ltd. was the principal producer, contributing over 1.5 million tons of salt to the State's output.

BHP, through its subsidiary Dampier Mining Co. Ltd., had a 76% interest in Texada Mines Pty. Ltd., with C. Itoh and Co. holding the remaining 14%. BHP's purchase of Texada in 1978 made it the first major salt exporter to have a majority Australian ownership. Texada Mines Pty. Ltd. output in 1978 and 1979 came from evaporation pans at Lake McLeod, north of Carnarvon, where extensive reserves of evaporites occur in brines over a 225,000-hectare area. The strata below the lake consisted of a layer of impure gypsum approximately 2 meters thick, underlain by halite (rock salt) to a depth of 15 meters. The amount of halite was estimated to exceed 3 million tons.

The halite was impregnated with saturated brine that contained about 21% sodium chloride. The brine was extracted from the halite bed by large capacity pumps and flowed to the crystallizing pan area. Roughly 25 crystallizer pans, covering an area of 800 hectares, were used for production. Each pan, with salt deposited about 300 millimeters thick, was harvested once a year. Harvesting proceeded throughout 1978 and 1979 as various pans were cleared in sequence and then refilled with brine.

Leslie Salt at Port Hedland, sold all its interests to Cargille Inc. of Minneapolis, U.S.A., in 1978. The company produced about 1.0 million tons of salt in 1978, well below its design capacity. Although production declined slightly, the crystallizer capacity was increased by approximately 20%. The company shipped to markets in the Philippines, the Republic of South Africa, Japan, Korea, New Zealand, and Taiwan.

In 1978, Lefroy Salt produced 200,000 tons from its operations on Lake Lefroy, where reserves were estimated at several hundred million tons. Four new crystallizers were completed in late 1978, but only one was used during 1979. A fourth washline was added during the year.

Responding to increased domestic requirements, South Australia's salt output in 1978 and 1979 was significantly above that for 1977. The State's major producers were Imperial Chemical Industries of Australia and New Zealand Ltd. (ICIANZ), Waratah Gypsum Pty. Ltd., Ocean Salt Pty. Ltd., and BHP. ICIANZ produced a combined total of 600,000 tons from sea water by solar evaporation at Dry Creek in 1978 and 1979. Waratah Gypsum Pty. Ltd. produced around 85,000 tons of salt from Lake MacDonnell, and BHP produced about 60,000 tons at Whyalla. These three companies accounted for about 75% of the State's total output.

Queensland's principal producer was ICIANZ, which operated a solar evaporation project near Rockhampton, utilizing underground brine. Production capacity was about 150,000 tons annually. In Victoria, virtually all the State's output was produced by Cheetham Salt Ltd. The company operated solar evaporation pans near Laverton on Port Phillip Bay, at Lara and Geelong on Corio Bay, and at Sea Lake near Lake Tyrrel. For each of the 2 years, 1978 and 1979, the company produced approximately 115,000 tons of salt.

Sulfur.—There were no known deposits of native sulfur in Australia, but pyrite was mined for its sulfur content at several locations, and four oil companies have sulfur recovery units. Sulfur was consumed mainly (93%) in the form of sulfuric acid to produce fertilizer, particularly superphosphate. Approximately 70% of sulfuric acid production was from imported brimstone and 30% from indigenous raw materials, principally zinc concentrates, pyrite concentrates, and lead concentrates.

Sulfur was also obtained from petroleum by Petroleum Refineries (Australia) Pty. Ltd. at Altona, Victoria, and Hallett's Cove, South Australia; Shell Refining (Australia) Pty. Ltd. at Clyde, New South Wales, and Geelong, Victoria; Australian Oil Refining Pty. Ltd. at Kernell, New South Wales; and Amoco (Australia) Pty. Ltd. at Bulwer Island, Queensland. The combined capacity of the plants was up to 52,000 tons per year, but the total output from petroleum in 1978 and 1979 was about 13,000 tons.

Only Electrolytic Zinc Co. of Australia Ltd. at Rosebery and the Mount Lyell Mining and Railway Co. Ltd. produced pyrite for acid production as a byproduct of base metal mining. Acid from this pyrite was produced at Burnie, Tasmania, by North-West Acid Pty. Ltd. in which the mining companies each have a half interest. The production by North-West Acid totaled about 320,000 tons of sulfuric acid in 1978 and 335,000 tons in 1979, compared with 318,100 tons in 1977.

Exploration work continued on pyrite black slate occurrences near Port Sorell and at Dial Range, both located in Tasmania. Tin deposits at Mount Bischoff and Renison Bell, also in Tasmania, are associated with enormous deposits of pyrite and pyrrhotite and were being investigated.

MINERAL FUELS

Coal.—Responding to a relatively firm demand, Australia's production, consumption, and export of black coal continued to grow during 1978 and 1979. Increased production from the largest coal-producing State (New South Wales), more than offset the slight decrease in Queensland in 1978 and 1979. Production increased in Western Australia and Tasmania, but output in South Australia remained at about the 1977 level. Though sales increased during 1978 and 1979, stocks continued to rise and at yearend were higher than at the end of 1977; the excess of production over sales was mainly coking coal.

The increase in domestic coal consumption in 1978 and 1979 was owing to electricity and steel demand, and the 8% increase in 1978 exports was owing to demand from the United States and Europe, resulting from the U.S. coal miners' strike. The value of black coal produced in 1978 and 1979 was higher than that of any other mineral commodity and so was the value of exports. The proportion of coal won by open pit mines remained at about 50% in 1978 and 1979.

The influence of two factors on the Australian coal industry became more apparent during 1978 and 1979. Both factors were associated with the continuing recession in the steel industry worldwide, particularly in Japan. The recession depressed the demand for coking coal, and some producers in Queensland and New South Wales successfully negotiated contracts for steaming coal in order to maintain or even increase the total amount of coal exported. This, in turn, directed attention to large deposits of good steaming coal that previously aroused little interest for export. The second factor was the increasing emphasis on diversifying the export destinations so that companies were less dependent on any one market such as the Japanese steel industry. This policy led to contractual sales to Israel, Brazil, the Republic of South Korea, Romania, the United Kingdom, and others.

New South Wales currently produces 55% of all coal mined in Australia. Production in 1978 and 1979 was about 51 million tons, mainly because of a substantial increase in output in the South Coast district and the Singleton North West district. The industry was preparing for large-scale expansion to serve markets both at home and abroad, but in the short-term growth in the market for New South Wales coal was being adversely affected by the worldwide recession in the steel industry. Nevertheless, development of the coal industry was proceeding. In 1978 and 1979, 10 major mines were under development, and a number of other mines were being planned or under investigation. These included a number of large surface mines in the Singleton district and proposals by the Electricity Commission for the establishment of new underground mines near Lithgow and Wakefield. The total planned production capacity for these new mines was 12 million tons of coal annually. A significant proportion of this new capacity would serve to replace declining output from existing mines. All these projects were scheduled to be in production by mid-1980.

Output in Queensland, which accounted for 36% of Australia's coal production, declined slightly in 1978 and 1979, mainly because of industrial problems. However, with the development of new mines in Central Queensland, such as Norwich Park, German Creek, Oakey Creek, and Gregory, coal production was expected to expand considerably within the next few years. In 1979, 20 underground and 23 surface mines were operating in the State. The upsurge in surface mining began in Queensland in the early 1970's when Utah Development Co. (owned 89.2% by Utah International Inc. of the United States and 10.8% by Utah Mining Australia Ltd.) started coal production. The company operated three open pit coal mines on the western side of the Bowen Basin, at Goonyella, Peak Downs, and Saraji in the Mackay coal mining district, producing over 50% of Queensland's total coal output; most of which was exported. Development work in a fourth open pit mine at Norwich Park, near Saraji began in 1979.

Another Queensland coal producer, Thiess Dampier Mitsui Coal Pty. Ltd., was considering a $25 million expansion program to boost output at its Moura-Kianga surface mine from 3 million tons to 5 million tons by 1985. The company also planned to develop two new underground mines in addition to its two existing underground mines. The company has exported coal only to Japan but was examining the prospects in other markets, including the Republic of South Korea, Taiwan, Europe, the United Kingdom, and the Pacific Basin. Houston Oil and Mineral Australia Inc. plans to complete its Oakey Creek open pit coal operation in Queensland by late 1980. At present, 200 people are employed at the mine site. A large bulk test open pit has been developed and samples sent to 20 countries.

Black coal reserves in Australia were estimated at 229 billion tons at yearend 1979, of this total 35 billion tons was indicated and 194 billion tons inferred. Indicated reserves were located in New South Wales (16 billion tons), Queensland (15.6 billion tons), Western Australia (1.8 billion tons), South Australia (730 million tons), and Tasmania (140 million tons). Substantial deposits of coal have also been delineated in areas not being mined, notably in the Surat Basin (Queensland), at Lake Phillipson in the Arckaringa Basin (South Australia), and in the Corrabin-Oaklands Basin (New South Wales).

Lignite.—Victoria was the only State that produced lignite in 1978 and 1979. The major deposits in Victoria were in the Latrobe Valley, 130 to 200 kilometers southwest of Melbourne, where the State Electricity Commission at Yallourn and Morwell produced more than 95% of the State's total output. The remainder was produced by privately owned mines at Anglesea and Bacchus Marsh. Coal was won by large dredges with an excavating capacity of 2,000 tons per hour. The Yallourn open pit produced at a rate of 13 million tons annually. Traditionally, production from Yallourn has been used to produce a high-grade solid fuel in the form of briquets for domestic and industrial use. However, briquet was also used as a basis for the production of high-grade char, gas, liquid fuel products, and other chemical industry feedstocks.

Research into production of oil from coal was being sponsored by several governments and private companies. Japanese interests were reported to be willing to establish a demonstration plant for conversion of Victorian lignite into solvent-refined coal suitable for steelmaking. Establishment of a full-scale plant was proposed if the demonstration proves successful.

In 1979, brown coal reserves were estimated at 122 billion tons (67 billion tons indicated and 55 billion tons inferred). Victoria has 66.7 billion tons of indicated reserves (12.2 billion tons saleable), and the remainder was in the Saint Vincent Basin of South Australia.

Petroleum and Natural Gas.—Australia's production of natural gas increased significantly in 1978, but crude petroleum output was only marginally higher. Of the total, about 145 million barrels was from the Gippsland Basin (Bass Strait) Victoria's offshore fields, 12 million barrels from the Barrow Island field in Western Australia, and the balance from the declining Moonie and Alton fields in the Surat Basin in Queensland. Production in 1979 was comparable, with the Bass Strait the principle source. Production represented about 65% of current domestic requirements, but with recent small discoveries and revised estimates of reserves, this degree of self-sufficiency could be maintained until the mid-1980's.

Input of crude oil and other feedstock to Australian refineries totaled about 300 million barrels in 1978. Indigenous crude oil comprised about 65% of this total; the balance was imported, mainly from the Middle East.

The Commonwealth Government dropped the price fixing arrangement under which domestic crude was sold at a price unrelated to world parity, and most Australian crude was sold at import parity prices. This has provided an incentive to intensify the search for new resources, and expenditures in 1979 were estimated at $130 million. The number of exploration wells rose to 52, and a minimum of 83 were planned for 1980. An additional bonus for the oil industry was the opening up of the high potential offshore Exmouth Plateau for petroleum exploration. In water depths up to 700 meters, the costs and technical problems will exceed those encountered in most other Australian projects.

The biggest news in development, however, remains the North West Shelf Natural Gas Development Project in Western Australia. A consortium comprising the BHP Co., Shell Oil Co., Woodside Petroleum Co., British Petroleum, and California Asiatic Oil Co. was continuing a feasibility study that could lead to production by 1984. The aim of the North West Shelf project is to produce gas and condensate from the North Rankin field, pipe it to shore, and process it into pipeline-quality gas, liquefied natural gas (LNG), and condensate suitable for markets in Australia and abroad. In 1979, the Federal Government approved the export of 55% of the current estimated reserves from the project. Approximately 6.5 million tons of LNG could thus be exported annually over a 20-year period. A contract has been signed between the consortium and the Western Australian State Energy Commission for the sale of up to 10.5 million cubic meters of gas per day over a 20-year period. This would be delivered to customers in the southwest of the State through a 1,300-kilometer-long pipeline from Dampier.

Uranium.—Australia is expected to become a major force in the world uranium market within the next few years, when production is initiated in the Northern Territory. After long delays owing to a ban on uranium mining by the former Government, pressures from environmentalists, and problems with aboriginal claims, a number of projects were moving ahead. However, the Mary Kathleen Mine in Queensland was the only one in production in 1978 and 1979.

Mary Kathleen Uranium Ltd. (MKU) produced 608 tons of U_3O_8 in 1978 and 800 tons in 1979. Those figures were significantly above the 1977 total of 420 tons. The rising production levels indicate that most of the difficulties that beset the company in 1977 and early 1978 have been resolved. The installation of new equipment in 1979 and the completion of $6 million worth of modifications could lift the production rate even higher. MKU is an open pit mine in which ore was mined by conventional drilling, blasting, loading, and hauling equipment. The mine consisted of a series of benches cut into the hill slope to a height of 105 meters above the valley floor and extended to 60 meters below. The ore was processed on site, and high-grade yellow cake was railed from the mine to Brisbane and shipped to the United States, the Federal Republic of Germany and Japan.

In 1977, the Federal Government accepted the findings of an extensive public inquiry and gave approval for uranium mining to proceed under stringent conditions relating to export controls and safeguards. This decision aroused vehement opposition, but the main cause of the delay was negotiations required by provisions of the Aboriginal Land Right Act. Under this act, the aborigines have the right to claim royalties and compensation for the use of tribal lands, and each developer must conclude an agreement with the Northern Land Council before any mining can proceed. Negotiations in 1978 led to an agreement that allows development of the Ranger project.

In addition to Ranger Uranium Mines Pty. Ltd., Queensland Mines Ltd. (Nabarlek) entered the construction stage of development in 1979. Also, WMC's environmental impact statement, a prerequisite for development of the Yeelirrie uranium project, was approved by the Western Australia State Government and the Federal Government in 1979. The company plans to construct a metallurgical research plant in Kalgoorlie.

Measured reserves in four large deposits in the Northern Territory total 297,000 tons U_3O_8 comprising Jabiluka, 127,000 tons; Ranger, 100,000 tons; Koongarra, 15,000 tons; and Nabarlek, 10,000 tons. The planned initial rate of production was 9,000 tons per year.

The Yeelirrie deposit in Western Australia has measured reserves of 46,000 tons U_3O_8, the Beverley and Mount Painter deposits in South Australia have 16,000 tons, and remaining reserves at Mary Kathleen totaled about 7,500 tons. The combined total of 366,500 tons U_3O_8 in seven deposits was considered available for immediate development. Numerous other prospects were under investigation throughout the country.

The Mineral Industry of Austria

By William F. Keyes[1]

Austria's economic performance during 1978 and 1979 was generally satisfactory. One of the strongest areas of the economy during this period was export sales. The Austrian schilling (AS) which is generally linked with the West German mark, remained firm, and the current account deficit decreased from AS49 billion[2] in 1977 to AS30 billion in 1978.

The country was nevertheless threatened by economic stagnation after a quarter century of annual growth at a rate of 4% to 5%, although conditions improved somewhat late in 1979. The Government reacted by introducing a three-phase program aimed at countering persistent budget and external payments deficits. The objectives of this program were 1) to cut consumption through a credit squeeze, 2) to apply a policy that would restrict wage settlements, and 3) to provide investment incentives. This last policy was instituted in the State-owned steel industry, which had no plans to expand production, but which continued to invest in more modern and efficient equipment. Under the program, purchases of new equipment were to be largely financed by the Government.

The minerals and metals industry of Austria was only a small factor in the economy. Iron ore, petroleum, natural gas, and coal (lignite) were produced in amounts that were less than sufficient for the domestic economy, but the country was self-sufficient in or had an export surplus of magnesite and steel. There was a small amount of domestic mine production of a number of nonferrous and nonmetallic minerals. Employment in the mining industry totaled 13,500 workers at the beginning of 1979, reflecting a decline of 7% since 1978 and about 15% since 1976.

PRODUCTION

Production of minerals in Austria is suffering a long-term decline, with no apparent relief in sight, since most mines have been known and exploited for many decades, or even centuries. Table 1 reports minerals production for each of the past four years.

TRADE

Austria imports most of its requirements for crude minerals and finished metals. Exports of a few domestically produced nonmetallic minerals are of some importance in world trade; these include magnesite, graphite, cement, talc, and kaolin. Exports and imports in 1977 and 1978 are shown in tables 2 and 3, respectively.

Trade with the United States in minerals and metals consists primarily of U.S. exports to Austria of phosphate rock, radioactive materials, and ammonia, and U.S. imports from Austria of aluminum, iron and steel semimanufactures, and ferroalloys.

Waste and sweepings of precious metals kilograms	29,743	38,168	West Germany 37,650; United Kingdom 332.
Oxides, hydroxides, peroxides of metals	1,125	1,582	West Germany 820; Italy 707.
Base metals including alloys, all forms	1,564	4,719	United Kingdom 2,578; United States 1,075; Italy 906.
NONMETALS			
Abrasives:			
Natural: Pumice, emery, natural corundum, other	39	17	NA.

See footnotes at end of table.

Table 2.—Austria: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Abrasives —Continued			
Grinding and polishing wheels and stones	13,106	12,934	West Germany 1,735; Romania 1,360; Poland 1,227.
Asbestos	102	80	East Germany 68.
Cement	71,288	29,242	Yugoslavia 13,856; West Germany 10,854; Hungary 3,541.
Chalk	3,432	5,980	West Germany 3,082; Hungary 1,654; Yugoslavia 596.
Clays and clay products (including all refractory brick):			
Crude:			
Kaolin (china clay)	13,404	21,271	Italy 11,611; Hungary 6,258; Yugoslavia 2,533.
Other	329	199	Hungary 90; Czechoslovakia 58.
Products:			
Refractory (including nonclay brick)	157,682	168,117	France 27,880; West Germany 27,351; Sweden 10,288.
Nonrefractory	18,563	26,280	West Germany 22,964; Switzerland 2,197.
Diamond:			
Industrial value	$65,408	$6,680	NA.
Other, worked do	NA	$136,896	West Germany $86,076; Belgium-Luxembourg $50,544.
Diatomite and other infusorial earth	1,058	1,027	Yugoslavia 846; Romania 85; West Germany 54.
Feldspar	23	NA.	
Fertilizer materials:			
Crude, unspecified	4	NA.	
Manufactured, phosphatic	28,749	38,511	Czechoslovakia 28,079; Hungary 10,432.
Fluorspar	2	NA.	
Graphite, natural	16,859	17,787	Poland 7,959; West Germany 6,547; Italy 1,098.
Gypsum and plasters	165,801	189,752	West Germany 169,315; Italy 14,256; Hungary 6,134.
Lime	1,738	1,955	West Germany 1,566; Hungary 173; Switzerland 135.
Magnesite	103,045	109,536	West Germany 15,871; Poland 14,538; Hungary 8,576.
Mica, all forms	71	156	Yugoslavia 30; West Germany 18; Czechoslovakia 17.
Pigments, mineral, including processed iron oxides	6,213	6,905	West Germany 2,085; United Kingdom 1,310; Netherlands 980.
Precious and semiprecious stones, including diamond:			
Natural kilograms	960	2,306	West Germany 1,179; United Kingdom 287; Switzerland 198.
Manufactured do	2,135	2,164	United States 528; West Germany 394; Yugoslavia 103.
Pyrite	--	44	NA.
Salt	54	48	NA.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous including marble and limestone	69,205	76,671	West Germany 61,355; Switzerland 15,229.
Slate	7	37	NA.
Other	47,229	70,863	West Germany 70,428.
Worked:			
Paving and flagstone	7,954	13,114	West Germany 7,777; Switzerland 5,264.
Slate	33	27	NA.
Other	1,651	2,942	West Germany 2,322; United States 159.
Dolomite	12,912	8,508	West Germany 5,021; France 1,094; Yugoslavia 792.
Gravel and crushed rock	373,133	430,665	Switzerland 245,640; West Germany 179,068.
Limestone	4	30	NA.
Quartz and quartzite	440	134	NA.
Sand, excluding metal bearing	110,640	126,716	West Germany 64,985; Switzerland 48,067; Hungary 7,961.
Sulfuric acid, oleum	4,740	8,111	West Germany 3,474; Italy 2,441; Yugoslavia 1,117.
Talc, steatite, soapstone, pyrophyllite	87,811	87,097	West Germany 45,147; Italy 11,938; Switzerland 6,472.

See footnotes at end of table.

Table 2.—Austria: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Other:			
Crude	4,805	4,028	West Germany 3,664; Netherlands 109.
Slag, dross, and similar waste, not metal bearing	27,275	34,648	West Germany 28,328; Italy 6,064.
Oxides and hydroxides of magnesium, strontium, barium	63	(1)	NA.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	6	15	NA.
Carbon black and gas carbon	63	10	NA.
Coal:			
Anthracite and bituminous, including briquets	6	28	NA.
Lignite and lignite briquets	8,429	5,433	West Germany 5,429.
Coke and semicoke	68,654	63,805	Romania 62,033; West Germany 586; Italy 527.
Gas, manufactured	26,806	34,412	Italy 25,749; Czechoslovakia 6,664; Yugoslavia 1,993.
Hydrogen, helium, rare gases thousand cubic feet	53,664	54,089	Hungary 30,134; West Germany 11,671; Czechoslovakia 9,510.
Peat, including peat briquets and litter	10	3	NA.
Petroleum refinery products:			
Gasoline, aviation and motor thousand 42-gallon barrels	(1)	52	Yugoslavia 50.
Kerosine and jet fuel do	--	(1)	NA.
Distillate fuel oil do	1	1	All to Czechoslovakia.
Residual fuel oil do	345	239	Czechoslovakia 198; Poland 40.
Lubricants do	r629	642	Czechoslovakia 284; Poland 119; Yugoslavia 103.
Other do	582	50	NA.
Total do	1,557	984	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	16,702	14,526	West Germany 7,635; Yugoslavia 4,645; Italy 979.

rRevised. NA Not available.
1Less than 1/2 unit.

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite	34,233	40,226	NA.
Oxide and hydroxide	210,243	217,583	West Germany 13,072; France 3,138.
Metal including alloys:			
Scrap	55,838	47,061	NA.
Unwrought	19,246	14,891	Norway 7,680; West Germany 3,870; Hungary 1,149.
Semimanufactures	28,455	29,235	West Germany 14,790; Switzerland 4,435; Hungary 1,794.
Antimony:			
Ore and concentrate	202	125	Canada 100; China, Mainland, 25.
Metal including alloys, all forms	92	52	Belgium-Luxembourg 50.
Arsenic trioxide, pentoxide, acids	26	24	NA.
Cadmium metal including alloys, all forms	6	4	West Germany 3.
Chromium:			
Chromite	85,492	61,947	Republic of South Africa 26,784; Iran 13,352; Turkey 7,140.
Oxide and hydroxide	328	321	West Germany 219; U.S.S.R. 72; Poland 10.
Cobalt oxide and hydroxide kilograms	4,700	6,100	West Germany 3,700; Belgium-Luxembourg 2,000.
Columbium and tantalum: Tantalum metal including alloys, all forms do	18,600	15,100	West Germany 6,100; United States 5,900; Belgium-Luxembourg 2,100.
Copper:			
Ore and concentrate	4	8	NA.
Copper sulfate	322	349	France 134; Italy 113; Belgium-Luxembourg 50.
Metal including alloys:			
Scrap	12,115	15,601	West Germany 7,371; Hungary 4,316; Switzerland 2,142.
Unwrought	22,416	21,378	Republic of South Africa 7,781; West Germany 7,234; Albania 2,534.
Semimanufactures	39,072	43,490	West Germany 24,391; United Kingdom 8,269; Sweden 3,409.
Gold metal, unworked or partly worked thousand troy ounces	328	263	Republic of South Africa 111; Switzerland 64; West Germany 56.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	2,611	2,619	Brazil 1,332; U.S.S.R. 752; Liberia 297.
Roasted pyrite do	113	54	West Germany 42; Italy 9; Yugoslavia 3.
Metal:			
Scrap do	79	116	West Germany 65; Czechoslovakia 20; U.S.S.R. 11.
Pig iron, cast iron, similar materials[1] do	96	144	U.S.S.R. 40; Romania 33; East Germany 17.
Ferroalloys:			
Ferromanganese do	18	20	Norway 12; West Germany 4; Yugoslavia 2.
Other do	r50	56	U.S.S.R. 9; Yugoslavia 8; Norway 6; Sweden 5.
Steel, primary forms do	r193	330	West Germany 86; Romania 82; Czechoslovakia 48.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	199	200	West Germany 83; Italy 70; Switzerland 20.
Universals, plates, sheets do	197	164	West Germany 86; France 20; Italy 20.
Hoop and strip do	52	51	West Germany 34; Switzerland 6; Italy 3.
Rails and accessories do	3	4	West Germany 2; Switzerland 1.
Wire do	r19	23	West Germany 7; Belgium-Luxembourg 4; France 3.
Tubes, pipes, fittings do	148	205	West Germany 108; France 39; Italy 20.
Castings and forgings, rough do	10	9	West Germany 7.
Lead:			
Ore and concentrate	7,822	4,258	All from Italy.
Oxide	738	810	Italy 653; West Germany 80; France 35.
Metal including alloys:			
Scrap	2,114	1,203	Switzerland 1,080; West Germany 120.
Unwrought	23,198	24,510	West Germany 7,712; Yugoslavia 7,293; Denmark 2,751.
Semimanufactures	736	821	West Germany 803.
Magnesium metal including alloys, all forms	2,179	1,908	Norway 1,222; West Germany 248; United States 153.

See footnotes at end of table.

Table 3.—Austria: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Manganese:			
Ore and concentrate	643	520	Morocco 174; Netherlands 173; West Germany 130.
Oxide	167	149	West Germany 120.
Mercury ... 76-pound flasks	380	415	Italy 148; Sweden 99.
Molybdenum:			
Oxide	1,489	1,375	NA.
Metal including alloys, all forms	44	87	West Germany 56; Netherlands 15; Canada 10.
Nickel:			
Matte, speiss, similar materials	1,278	1,362	Cuba 665; United States 320; Netherlands 248.
Metal including alloys:			
Scrap	2,767	263	West Germany 159; Netherlands 83; Hungary 11.
Unwrought	2,288	2,400	United States 546; Republic of South Africa 392; United Kingdom 282.
Semimanufactures	1,263	627	West Germany 221; United States 209; United Kingdom 110.
Platinum-group and silver metals including alloys, all forms:			
Platinum-group ... troy ounces	54,045	75,200	West Germany 70,667; United Kingdom 2,090; Switzerland 1,222.
Silver:			
Bullion ... thousand troy ounces	9,983	7,256	France 2,160; Switzerland 1,572; United Kingdom 1,346.
Other (powder) ... do	9	51	All from West Germany.
Semimanufactures ... do	4,575	4,318	West Germany 3,604; United Kingdom 511; Switzerland 177.
Tin metal including alloys, all forms	574	574	West Germany 237; Thailand 169; Netherlands 45.
Titanium oxide	8,621	10,349	West Germany 6,178; France 1,123; Italy 1,032.
Tungsten:			
Ore and concentrate	2,205	4,533	NA.
Oxide and hydroxide	238	131	NA.
Metal including alloys, all forms	744	492	United States 131; West Germany 109; Belgium-Luxembourg 72.
Zinc:			
Ore and concentrate	2,200	1	NA.
Oxide	799	740	West Germany 627; France 45; United Kingdom 41.
Metal including alloys:			
Scrap and blue powder	398	1,166	Belgium-Luxembourg 528; Hungary 322; United Kingdom 138.
Unwrought	7,896	4,080	West Germany 2,961; Zambia 603; Netherlands 168.
Semimanufactures	1,414	1,982	West Germany 1,717; Yugoslavia 101; Poland 60.
Other:			
Ores and concentrates	10,361	10,207	United States 3,899; Australia 1,642; Netherlands 1,334.
Ash and residue containing nonferrous metals	97,369	102,681	U.S.S.R. 50,224; Hungary 15,272; East Germany 14,038.
Waste and sweepings of precious metals ... kilograms	513	2,966	Yugoslavia 2,957; Denmark 5; West Germany 4.
Oxides, hydroxides, peroxides of metals	2,690	3,804	Republic of South Africa 3,223; West Germany 358; Belgium-Luxembourg 93.
Base metals including alloys, all forms	6,240	2,622	U.S.S.R. 1,513; Republic of South Africa 321; Belgium-Luxembourg 271.
NONMETALS			
Abrasives:			
Natural: Pumice, emery, natural corundum, other	668	266	Italy 132; West Germany 55.
Dust and powder of precious and semiprecious stones (including diamond) ... kilograms	98	144	United States 123; Switzerland 15.
Grinding and polishing wheels and stones	936	935	West Germany 541; Italy 134; Yugoslavia 58.
Asbestos	39,074	30,807	Canada 13,078; U.S.S.R. 8,038; Republic of South Africa 5,393.
Barite and witherite	3,785	6,976	West Germany 3,622; Ireland 1,494; Czechoslovakia 1,147.
Boron materials:			
Crude natural borates	15,425	16,421	Turkey 9,137; United States 6,140; Italy 1,096.
Oxide and acid	758	851	France 769; West Germany 42; United Kingdom 11.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—At its Ranshofen smelter near Braunau-am-Inn, Vereinigte Metallwerke Ranshofen-Berndorf AG put a new aluminum scrap melting plant into operation. The plant was expected to save in energy costs, and it created 50 new jobs.

Iron Ore.—About 40% (by iron content) of the iron ore used by the Government-owned steel company, Vöest-Alpine Montan AG (VAM), was supplied from domestic mines, and the remainder was imported from overseas. In terms of gross weight, domestic ore production declined almost 20% from 1977 to 1978, to about 2.8 million tons containing 31% iron. Economic conditions were given as the cause. All domestic ore was supplied by three Vöest-Alpine mines; the Erzberg mine in Styria contributed about 85%; the Radmer mine near Erzberg contributed about 11%; and the declining Huettenberg mine, 70 kilometers southwest of Erzberg, contributed 4%.

Iron and Steel.—The financial condition of the Austrian steel industry, which consisted principally of VAM, the only primary steel producer, showed no significant improvement since 1977, which was the worst year for the industry since the end of World War II. VAM lost almost AS700 million (about $40 million) in 1978, compared with a loss of AS700 million to AS800 million in 1977. The forecast for 1979 was for a much smaller deficit, however. Crude steel production reached 4.8 million tons in 1978, reflecting an increase of 12% over that of 1977, and increased further to about 5.4 million tons in 1979.

VAM had no plans to increase output in the near future. However, a decision was made to build a second continuous caster at Donawitz that was expected to be ready for operation in 1980. The first continuous caster was commissioned in 1979, with a capacity of 800,000 tons per year, at a final cost of AS450 million. About 40% of Austrian steel was continuously cast in 1979, compared with 21% in 1975. Oxygen blown steel accounted for more than 80% of the total. Donawitz was also expected to get a new wire rod mill at a cost of AS1.4 billion as part of the investment program announced in 1977.

In September 1978, the newly appointed director general of the Österreichische Industrieverwaltungs AG (OIAG), the state holding company for VAM and other nationalized industries, called for financial assistance for the steel industry. A AS500 million bond issue was floated during 1978, but the director general noted that VAM was unable to internally generate the 75% of its investment needs that was called for by Government policy.

The transport of liquid pig iron between VAM's two plants at Donawitz and Linz, a distance of 215 kilometers, started in 1978. The iron, at a temperature of 1,380°C, is tapped from a blast furnace at Donawitz and run into torpedo ladles with capacities of 150 tons each. Two trains, each with two insulated ladles, make the journey to Linz in 5 1/2 hours, with a temperature loss of only 7°C per hour.

Lead-Zinc.—In 1978, expansion of the country's only zinc refinery at Gailitz (Arnoldstein), Carinthia, was completed, and production at the Bleiberg and Kreuth mines nearby was increased to about 39,000 tons of concentrate (or 22,000 tons of zinc) annually from the former level of 35,000 tons (17,000 tons zinc). These mines and the refinery were operated by Bleiberger Bergwerksunion AG, which is owned by the Austrian Government.

NONMETALS

Kaolin.—Production of marketable kaolin declined because of several years of low demand and competition from imports.

Two producers of kaolin operated three mines during the 1978-79 period. The Österreichische Kaolin-und Montanindustrie AG Nfg. KG (KAMIG) operated the Kriechbaum mine north of Schwertberg, 20 kilometers east of Linz, as well as the Weinzierl open pit mine east of Schwertberg. About 70% of KAMIG's crude kaolin came from Kriechbaum, and about 30% came from Weinzierl. A modernization program was completed, including an 8-kilometer pipeline from Kriechbaum to KAMIG's plant at Aisthofen, which was expanded. About a third of total Austrian kaolin production came from the Aspang surface mine of the Aspanger Kaolin und Steinwerke AG, located between Aspang and Zoberg, south of Vienna. Both KAMIG and Aspanger also produced byproduct quartz sand.

Magnesite.—The capacity of the Austrian magnesite industry was reported as 550,000 tons per year of dead-burned product and 145,000 tons per year of caustic calcined magnesite. Actual production of each of these products was at about 75% and 85% of capacity, respectively, from nearly 1 million tons of crude magnesite. The two basic refractory producers in the country were Österreichisch-Amerikanische Magnesit AG (OAMAG), which is controlled by General Refractories of the United States, and Veitscher Magnesitwerke AG, a subsidiary of Magnesia AG of Switzerland. Both are large producers, and both have been long established in the industry. Both produced a range of basic refractory bricks and monolithics based on their own production of raw materials plus imports of chromite and low-iron magnesite. Austria does not produce low-iron magnesite; it imported this material from the eastern Mediterranean region. OAMAG's capacity was reported to have reached 180,000 tons per year of magnesite and chrome-magnesite brick and 45,000 tons per year of monolithics.

Refractories.—The principal producer of non-basic refractories in Austria was Didier Werke GmbH, a subsidiary of Didier Werke AG of Wiesbaden, West Germany. The company, which produces mainly fire clay bricks, increased sales to eastern Europe as domestic demand weakened.

Talc.—About 90% of Austrian talc production came from the three mines operated by Talkumwerke Naintsch GmbH, a subsidiary of Talcs de Luzenac SA of France. These were Rabenwald-Krughof, northeast of Graz near Weiz; Lassing, near Liezen; and Weisskirchen, near Knittelfeld, which reportedly also produced a mixture of chlorite, mica, and quartz. Ore from Rabenwald was processed mainly at Anger, Oberfeistritz, and Stubenberg, principally for ceramics.

MINERAL FUELS

Coal.—Removal of overburden continued at the new open pit at the Oberdorf lignite mine operated by Graz-Köflacher Eisenbahn und Bergbaugesellschaft (GKB) near Barnbach (Voitsberg), Styria. The Wolfsegg-Traunthaler Kohlenwerk AG (WTK) was successful in introducing protective hoods in its underground hydraulic mines near Ampflwang, Upper Austria. At the Trimmelkam (Upper Austria) mine of Salzach Kohlenbergbau GmbH (SK), the old vertical shaft was replaced with an inclined shaft that notably increased output.

Test drilling northeast of the Trimmelkam mine located an apparently mineable coalfield, and full information on the field's reserves was expected to be developed by 1980. It was anticipated that the field could be used as the fuel source for an additional 150-megawatt generator at the Riedersbach power station, which already gets much of its fuel from Trimmelkam.

The Fohnsdorf (Styria) mine of GKB, producer of the harder grade of lignite known as glanzkohle, was closed by the company during 1978. As a result, total domestic production of coal declined slightly, to just over 3 million tons. About six lignite mines remained in operation; three were operated by GKB in Styria, two were operated by WTK in Upper Austria, and SK also operated a mine in Upper Austria.

Austria and Poland concluded an agreement late in 1979 for the sale of 1 million tons per year of Polish coal for 20 years. An option to take another 500,000 tons annually was reportedly not being considered by the Austrian Government because of a desire to broaden its base of supply by obtaining coal from other sources, such as the Republic of South Africa. A coal-based powerplant comprised of a 320-megawatt unit and a 380-megawatt unit was planned to be built at Duernrohr in Lower Austria, 3 miles from the site of the Zwentendorf nuclear powerplant; the latter failed to gain approval for operation in a popular referendum in 1978. The Duernrohr plant was expected to become a principal consumer of Polish coal.

Petroleum.—Two Austrian companies continued their exploration and exploitation drilling programs at the same levels as in 1977; some 13 rigs were reported at work. The State oil company, Österreichische Mineralölverwaltungs AG (OMV), drilled in the Vienna basin (northeast of Vienna), where four wells reached their ultimate depths, between 1,454 meters and 3,460 meters, with shows of oil. Three other wells in the basin were still being drilled, including the Zistersdorf UT-1, which was targeted at 7,500 meters and had reached 6,825 meters. Drilling was unproductive elsewhere in the basin, as well as in central Austria, and in the southwest on the Yugoslav border.

Rohoel-Aufsuchungs GmbH (RAG), a joint subsidiary of Shell and Mobil, drilled and abandoned the Oberminathal-5 well in central Austria and was preparing to begin drilling two other wells elsewhere.

A summit meeting of Government members and Socialist Party leaders was scheduled for early 1980 to obtain agreement on new legislation to replace the Energy Management Law of 1976, which expires in June 1980. In view of Austria's high dependence (68%) on imported energy, chiefly in the forms of oil and gas, it was expected that the new legislation would be aimed at giving the Government powers to decree energy conservation and control before—rather than after—a crisis develops.

The Mineral Industry of Belgium-Luxembourg

By William F. Keyes[1]

BELGIUM

Little improvement in the Belgium economy was in evidence during most of 1978, although by yearend a change for the better was noted, and the upturn continued through 1979. It was estimated that the economy grew in real terms about 2.5% in 1978 to a gross national product (GNP) of U.S. $96 billion[2] and 3.5% in 1979 to $103 billion. The value in U.S. currency was inflated by the declining value of the U.S. dollar. Unemployment, at about 7% each year, was high, but this was mitigated by generous unemployment benefits. Wages also were surpassed in Europe only by those paid in Sweden and the Netherlands. The Belgian minerals industry, consisting largely of the processing of imported minerals and metals was, like the economy, at a low ebb, except that steel production recovered slightly from the record low it reached in 1977.

The major event of the period 1978-1979 in the mineral and metal industries was the working out of agreements on restructuring of the Belgian steel industry by the Government, the operators, and the labor unions. Efforts to help the similarly ailing fuels industry included studies of in situ gasification, the closing of one petroleum refinery as uneconomic, and the continued investigation of uranium occurrences. In Luxembourg the steel industry participated in a restructuring similar to that of the Belgian industry and continued modernization and rationalization.

The Belgian-Luxembourg steel industry was of significant world importance. Processing of nonferrous ores was also of major significance, but all other mineral production and processing, including coal, was chiefly of domestic importance.

PRODUCTION

The industrial production index increased from 117 to 120, but the general index of the extractive industries declined from 63.5 in 1977 to 57.9 in 1978 (1970=100). Both sectors declined during that period, coal from 49.9 to 45.0 and other minerals from 117.8 to 110.9. In the metallurgical industries the picture was mixed: The steel production index rose from 89.2 to 100.4 in 1978, and continued to rise somewhat in 1979, but the nonferrous metals production index declined from 149.8 to 144.8 from 1977 to 1979.

Production of minerals and metals in Belgium in the period 1976-1979 is given in table 1.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed individually, Belgium produces a number of other metals for which only aggregate output figures are available. These aggregates are included under "Other nonferrous metals."
[2]Reported figure.
[3]Known to include gold and silver and may include platinum-group metals.
[4]Derived by subtracting aluminum data from a reported total for unspecified base metals.

TRADE

Belgium is overall the eighth-largest trading partner of the United States. The major part of minerals and metals trade between the two countries consisted of U.S. exports of coal, petroleum coke and lubricants, and nonferrous ores to Belgium, and U.S. imports of diamonds, semifabricated steel products, and aluminum and other base metals. The balance of trade in minerals favored Belgium: U.S. imports from Belgium were valued at $830 million, while U.S. exports to Belgium were $354 million in 1977.

Selenium, elemental kilograms	r166,500	157,200	West Germany 78,400; Netherlands 21,800; United States 18,400.
Silver metal including alloys thousand troy ounces	25,051	20,994	United Kingdom 7,297; West Germany 3,174; France 2,887.
Tin:			
Ore and concentrate	--	56	Portugal 35.
Oxides	r1	--	
Metal including alloys:			
Scrap	98	149	NA.
Unwrought	2,615	2,417	France 1,177; Netherlands 248; West Germany 224.
Semimanufactures	39	71	Netherlands 25; Switzerland 5; United Kingdom 2.
Titanium:			
Ore and concentrate	31	3	NA.
Oxides	29,087	28,457	West Germany 8,345; France 5,752; United States 2,478.
Metal including alloys, all forms	109	164	Italy 35; France 29; West Germany 25.
Tungsten:			
Ore and concentrate	49	45	France 21; Netherlands 10; United Kingdom 8; United States 6.
Metal including alloys, all forms	230	215	West Germany 87; Netherlands 83; United Kingdom 21.
Uranium and titanium ores and concentrates	533	547	France 547.
Vanadium oxides	167	105	Japan 35; West Germany 30; United Kingdom 17.
Zinc:			
Ore and concentrate	27,585	11,676	France 6,612; West Germany 3,003; Netherlands 2,061.
Oxides	5,267	4,862	France 1,118; Hungary 1,040; West Germany 694.
Ash and residue containing zinc	56,533	42,685	France 12,742; West Germany 9,575.
Metal including alloys:			
Scrap	3,948	4,147	France 2,249; Netherlands 1,338.
Blue powder (dust)	16,585	18,405	West Germany 10,556; France 2,694; Netherlands 1,551.
Unwrought	188,824	187,102	West Germany 69,894; France 48,668; United States 19,968.
Semimanufactures	r6,583	9,108	West Germany 5,086; Netherlands 2,035; France 560.
Other:			
Ores and concentrates:			
Of niobium, tantalum, vanadium, zirconium	62	51	NA.
Of precious metals kilograms	--	200	NA.
Of base metals, n.e.s	r5	72	NA.
Ash and residue containing nonferrous metals	r26,581	43,969	Netherlands 30,801; France 4,935; West Germany 4,389.
Waste and sweepings of precious metals value, thousands	$5,540	$7,421	United Kingdom $4,908; West Germany $2,093.
Oxides, hydroxides, peroxides of metals	2,335	2,486	Netherlands 1,007; West Germany 444; United States 241.
Metals including alloys, all forms:			
Metalloids:			
Tellurium and arsenic	1	24	West Germany 6; United States 5; France 4.

See footnotes at end of table.

Commodity	1977	1978	Principal destinations, 1978
METALS —Continued			
Other —Continued			
Metals including alloys, all forms —Continued			
Metalloids —Continued			
Other	r127,114	119,636	Netherlands 102,652.
Alkali, alkaline earth, rare-earth metals	13	69	NA.
Pyrophoric alloys	--	1	NA.
Base metals including alloys, all forms, n.e.s	r299	293	Austria 142; West Germany 59; Finland 21.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	21,415	245	NA.
Dust and powder of precious and semiprecious stones, natural and manufactured kilograms	1,108	958	United States 262; Israel 132; United Kingdom 82.
Grinding and polishing wheels and stones	3,111	2,381	France 1,375; West Germany 400; United Kingdom 222.
Asbestos	225	221	Spain 75; Netherlands 48.
Barite and witherite	315	408	NA.
Boron materials:			
Crude natural borates	10,980	9,503	Netherlands 4,459; West Germany 4,419.
Oxides and acid	103	423	West Germany 158; United States 82; Canada 36.
Bromine	--	138	NA.
Cement thousand tons	2,399	2,762	Netherlands 1,616; West Germany 367; France 271.
Chalk	54,129	64,813	Netherlands 12,630; West Germany 12,105; Saudi Arabia 9,571.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite	7,845	8,273	France 4,541; West Germany 1,307; Italy 899.
Kaolin	6,187	3,175	Netherlands 1,782; West Germany 375; France 193.
Other	4,383	3,663	NA.
Products:			
Refractory (including nonclay brick)	r86,306	96,215	France 51,283; West Germany 15,308; Italy 4,852.
Nonrefractory value, thousands	$40,172	$53,459	Netherlands $24,967; West Germany $12,576; France $7,224.
Cryolite and chiolite kilograms	500	15,700	NA.
Diamond:			
Gem:			
Unworked thousand carats	22,317	24,564	India 11,780; United Kingdom 8,755; Israel 1,304.
Worked do	3,143	3,077	United States 901; West Germany 345; Hong Kong 343.
Industrial:			
Unworked do	9,096	8,641	United States 2,697; Ireland 2,236; United Kingdom 1,593.
Worked do	r11	9	Switzerland 2; United Kingdom 2; Canada 1; United States 1.
Diatomite and other infusorial earth	4,103	3,567	NA.
Feldspar, leucite, nepheline, nepheline syenite	6,975	8,543	Netherlands 8,489.
Fertilizer materials:			
Crude:			
Nitrogenous	13,723	9,816	Italy 4,286; West Germany 3,850; France 1,097.
Phosphatic	r11,553	14,203	France 6,248; Netherlands 4,963; West Germany 1,833.
Potassic, K_2O content	r63	138	NA.
Manufactured:			
Nitrogenous, N_2 content thousand tons	481	516	France 166; West Germany 116; India 21.
Phosphatic, P_2O_5 content do	265	280	France 134; West Germany 104.
Potassic, K_2O content do	245	283	France 67; Norway 47; Japan 41; Netherlands 23.
Other, including mixed do	1,431	1,641	France 867; West Germany 232; Venezuela 80.
Ammonia do	111	85	France 83.
Fluorspar	1,439	4,540	West Germany 4,074.
Graphite, natural	68	68	NA.
Gypsum and plasters	38,420	54,905	Netherlands 49,016; West Germany 3,664.
Lime thousand tons	616	590	Netherlands 505; France 6; Ivory Coast 3.
Magnesite	3,318	3,594	France 2,418; West Germany 541; Sweden 152.

Other	11,346	10,251	Netherlands 3,107; West Germany 2,850; France 2,415.
Dolomite, chiefly refractory grade thousand tons	1,469	1,602	Netherlands 785; West Germany 615; France 40.
Gravel and crushed rock do	10,615	12,284	Netherlands 3,646; France 3,754; West Germany 132.
Limestone (except dimension) do	651	536	Netherlands 343; France 187.
Quartz and quartzite do	10	10	West Germany 5; Netherlands 1; Austria 1.
Sand, excluding metal bearing do	3,580	2,975	Netherlands 971; France 806; Italy 271.
Sulfur:			
Elemental, all forms	17,353	10,661	Netherlands 2,491; France 1,606; West Germany 1,292.
Sulfur dioxide	71	NA	
Sulfuric acid	116,981	125,624	France 102,179.
Talc, steatite, soapstone, pyrophyllite	19,857	18,286	West Germany 5,847; United Kingdom 2,979; Sweden 2,049.
Other:			
Crude:			
Lithium minerals	61	--	
Vermiculite, perlite, chlorite	912	1,134	NA.
Other thousand tons	261	152	Netherlands 128; France 18.
Slag, dross, and similar waste, not metal bearing do	2,068	2,185	Netherlands 784; West Germany 781; France 527.
Oxides and hydroxides of magnesium, strontium, barium	600	194	NA.
Iodine and fluorine	127	8	NA.
Building materials of asphalt, asbestos, and fibercement, and unfired nonmetals, n.e.s thousand tons	372	1,370	Netherlands 435; United Kingdom 281; France 230.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	539	4,465	NA.
Carbon black and gas carbon:			
Carbon black	655	947	Netherlands 127; West Germany 99; Morocco 47.
Gas carbon	78	NA	
Coal and briquets:			
Anthracite and bituminous coal thousand tons	357	246	West Germany 92; France 90; Spain 18; Norway 11.
Briquets of anthracite and bituminous coal	9,682	25,622	France 19,199; West Germany 3,059; Spain 1,000.
Lignite and lignite briquets	59	8	NA.

See footnotes at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
MINERAL FUELS AND RELATED MATERIALS —Continued			
Coke and semicoke ------ thousand tons--	150	196	France 111; United States 24; West Germany 23.
Gas, natural -------- million cubic feet--	r87,111	1,596	United States 1,505.
Hydrogen, argon, rare gases -----------	31,799	39,981	France 25,908; West Germany 8,339; Netherlands 367.
Peat, including peat briquets and litter ----	595	1,984	NA.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels--	r(1)	591	Netherlands 564.
Refinery products:			
Gasoline and white spirit ---do----	r3,794	3,451	West Germany 1,151; Netherlands 568; United Kingdom 425.
Kerosine -------------do----	1,058	826	West Germany 251; United Kingdom 66; Netherlands 63.
Distillate fuel oil --------do----	r2,603	2,148	West Germany 1,171; Denmark 272; United Kingdom 91.
Residual fuel oil---------do----	r47,108	36,615	United Kingdom 9,820; Netherlands 5,700; West Germany 4,709.
Lubricants------------do----	2,441	2,265	Netherlands 703; West Germany 270; Switzerland 137.
Other:			
Liquefied petroleum gas -do----	r2,906	2,628	Netherlands 1,055; United States 584; France 206.
Mineral jelly and wax --do----	r29	40	France 14; West Germany 5; Italy 3.
Nonlubricating oils, n.e.s-do----	r56	67	Netherlands 30; Saudi Arabia 15; Lebanon 4; Syria 4.
Bitumen and other residues do----	r1,236	1,296	Netherlands 537; Sweden 236; Norway 231.
Bituminous mixtures, n.e.s do----	115	98	Netherlands 33; France 29; West Germany 13.
Pitch, pitch coke, petroleum coke do----	r328	375	Netherlands 184; France 109; West Germany 79.
Unspecified---------do----	93	68	West Germany 17; Netherlands 4; Denmark 3.
Total ----------do----	r61,767	49,877	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons--	228	276	West Germany 99; Netherlands 90; France 38.

rRevised. NA Not available.
1Less than 1/2 unit.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities

COMMODITY REVIEW

Metals.—*Cobalt.*—In 1978, Metallurgie Hoboken-Overpelt SA brought an expanded plant into operation for the production of cobalt oxides at Olen, but the shortage of supplies from Zaire, the former Belgian Congo, caused it to continue operating well below capacity. A start was made by the company on the erection of an ultrafine-cobalt-powder plant at Laurinburg, N.C. After June 1979, that portion of Zaire cobalt destined for the United States and Japan was routed there directly, without the repackaging formerly done at Olen. The 20% of Zaire cobalt refined at Olen was not affected.

Iron and Steel.—Belgium's last iron ore mine, between Halanzy and Musson on the French-Luxembourg border, which was operated by Metallurgique & Minière de Rodange-Athus, was closed permanently at the end of November 1978. Production had declined to less than 50,000 tons per year.

The ailing Belgian steel industry was in a turmoil during the 2 years, after suffering heavy losses for 3 previous years. Production, although increasing, was only somewhat over 12 million tons in 1978 and 13 million tons in 1979, that is, only about 70% of capacity.

In May 1978, a tripartite conference of Government, industry, and labor representatives agreed on the basic form of reorganization of the industry. The chief elements included minority state equity in the steel firms; encouragement of closer ties with neighboring country steelmakers; state-controlled investment in modernization but not in new capacity; elimination of 8,500 jobs, with expensive Government-subsidized workers' benefits; and further extension of existing credit lines to the firms.

In the following November, lengthy discussions pursuant to the tripartite conference resulted in general agreement on a plan for restructuring the industry. The plan, called the "Claes Plan" after the Minister of Economic Affairs, envisaged the reorganization of the Belgian steel industry into three cores: (1) ARBED, including plants in Luxembourg and the Saar, and ARBED's subsidiary Sidmar, near Ghent, Flanders; Charleroi, consisting of the Triangle plants of three steelmakers, Hainaut-Sambre (HS), Thy-Marcinelle et Monceau (TMM), and Laminoirs du Ruau; and the Marchienne plant, formerly belonging to Cockerill; (2) Cockerill itself around Liege; and (3) the smaller independent steelmakers, Usines Gustave Boel SA, SA Fabrique de Fer de Charleroi, and SA Forges de Clabecq. Cockerill, which was seeking an alliance with Estel, the Dutch-German steelmaker, was assured, as were the independents, that its capacity would not suffer vis-a-vis the ARBED giant.

The Government (50% national, 50% regional) would take a large equity in HS (30.9%), TMM (42.3%), and Cockerill (28.9%), as well as in Sidmar, and a more limited participation in Clabecq. Additional participation in Cockerill would be 19.3% held by the Société General de Belgique and Fibelpar (including Cobepa, Bruxelles-Lambert, and Financiere du Ruau) and 51.8% held by small shareholders. In HS, 20.6% would be held by Financiere du Ruau and 48.5% by others. Some 28.2% of TMM would be held by Financiere du Ruau and 29.5% by others. The State would also assume at least two-thirds of the firms' debts. Estimates were that the annual cost to the Government would be about BF4.5 billion or roughly US$150 million. The Government will be represented on the firms' boards of directors on a 50-50 basis, half being through the Société Nationale d'Investissements and the other (regional) half through the Société Regionale d'Investissements.

New investments and disinvestments were to be coordinated by a planning section of a National Commission for Planning and Control (CNPC), with national Government and private sector representation. The planning section would define investment priorities and restructuring, promote common purchasing, and increase productivity, all implying decreased production and employment.

In January 1978, a BF44 billion (US$1.5 billion) program of investments was approved by the CNPC; all investments were to be financed 50-50 by the Government and industry investors (banks and holding companies). Total capacity of the industry would be increased to some 20 million tons per year, from the present level of 17 million tons; misgivings were voiced about this increase in a potentially declining market. However, potential increases in productivity would hopefully range from 22% in nonflat products (287 tons per year per worker to 350 tons) to 28% in rolled products (430 tons to 550 tons).

Nearly 5,000 workers and 1,850 salaried employees were to be separated in the entire steel industry, about two-thirds at Cockerill, but a fund would be created, on the basis of BF500,000 per job lost, to assist workers to convert to new employment. Since the funds would be spent largely in the French-speaking Walloon region, where the bulk of the steel industry is located, the cooperation of Flemish (Dutch speaking) regions was assured by including the textile and shipbuilding sectors in the fund.

Lead-Zinc.—An environmental problem came to public notice in 1978 at the Hoboken copper-lead operations of Metallurgie Hoboken-Overpelt SA, near Antwerp, when cases of lead poisoning were discovered among Hoboken schoolchildren. The mayor of Hoboken threatened to close the plant but relented later; the company responded by detailing the antipollution measures it has taken since 1973, amounting to $1.5 million annually since then, and reaching $4 million by 1979.

Annual zinc production was reduced to about 240,000 tons, a decrease of 15%, in response to indications from the International Lead and Zinc Study Group that demand was falling behind production; lead production remained stable at 124,000 tons. After suffering losses in 1977, two of Belgium's three electrolytic zinc producers received some relief as prices rose late in 1978. Worst hit by the depression in metal prices was the largest producer, Ste. des Mines et Fonderies de Zinc de la Vieille Montagne SA, with a plant (170,000 tons per year capacity) at Balen, which had few other products to depend on. The third-largest producer, Ste. de Prayon, et Ehein, near Liege (60,000 tons per year), was also a producer of chemicals. The second-largest producer, Hoboken-Overpelt, with a zinc plant at Overpelt (100,000 tons per year), continued in the black, owing largely to its production of copper and other metals, but a reduction of the work force at Overpelt was necessary.

During 1979, producers continued to announce production cuts in response to unprofitable prices. Vielle Montagne cut its production rate by about 20,000 tons per year at the end of 1979, and Prayon, after announcing a 15% cutback, shut down for the entire month of October.

Minor Metals.—Metallurgie Hoboken-Overpelt was constructing a new plant to recover indium and tellurium, as well as antimony oxide, from lead refinery byproducts. The new unit was to employ about 30 persons.

Molybdenum.—Continued supply of molybdenum to the European market from Noranda in Canada and Codelco in Chile was assured when the labor contract was extended, with a small increase in wages, at the Ghent plant of Sodacem SA. The plant roasts concentrates with a content of 5,000 tons per month of molybdenum.

Nonmetals.—*Barite.*—Belgium, although an important producer and exporter of nonmetallic minerals, such as sand and gravel, has not produced barite since before World War II, when the Fleurus mine was operated near Charleroi. During 1978, an American-controlled firm, NL-Baroid Minerals Inc., acquired a barite property and was planning to commence operations early in 1979.

Mineral Fuels.—*Coal.*—After preliminary testing, drilling began on July 1, 1978, on a 1,000-meter-deep in situ coal gasification site at Thulin, west of Mons; the work was a cooperative project financed by the Belgian Institut National des Industries Extractives, at Liege, a division of the Mines Administration (51%) and Kernforschungsanlagen Julich GmbH (49%) of Federal Republic of Germany. The project, interesting because of its great depth, was part of the Government's plan to maintain the Belgian coal mining industry, and particularly to foster utilization of reserves not currently minable. These reserves reportedly comprise some 2 billion tons of bituminous coal at a depth of 1,000 to 2,000 meters in the Center and Borinage coalfields around Mons, and over 20 billion tons north of the Kempen (Campine) field in the northeast Belgian province of Limburg. A BF200 million (US$7 million) installation to test in situ gasification was decided on late in 1979 and was to begin operations at Hensies nearby late in 1981.

Another move to help the coal industry was the agreement reached late in 1978 between Belgian coal and steel producers under which the steel producers will purchase all coking coal produced by Kempense Steenkolenmijnen, the Limburg producer, at least until 1990. The agreement will be at a price to be reviewed twice a year by the Government; the initial price was BF1,934 (about US$60) per ton.

Natural Gas.—A contract to construct the liquefied natural gas (LNG) terminal at Zeebrugge was awarded in 1978 by Distrigas SA and its consulting engineers, Tractebel Zeebrugge, to Pullman Kellogg Ltd., London, covering engineering, procurement, and advisory services. The terminal, with a capacity of 600 million cubic feet per day (6.2 billion cubic meters per year) will receive 5 billion cubic meters per year from an Arzew, Algeria, facility, which is also being constructed by Pullman Kellogg.

Petroleum.—The unprofitable Antwerp refinery, Raffinerie Belge des Petroles SA (RBP), also known as Belgisch Petroleum Raffinaderij NV, with distillation capacity of about 100,000 barrels per day, was closed by the controlling company, Occidental Petroleum Inc. of the United States, in September 1978. The action was followed by a 3-week strike by all petroleum workers in Belgium, in an attempt to save the jobs of the 256 workers. The strike was settled with increased benefits and a preferential hiring concession in the industry as a whole for the jobless. Management was particularly chary of guaranteeing displaced workers employment elsewhere in the depressed industry, which the union interpreted as being required under the 1959-60 petroleum sector agreement.

Seven Belgian refineries were active at the end of 1979, although at only about 65% of capacity, after closure of RBP. These had an approximate total distilling capacity of 1 million barrels per day. The largest, with one-third of the industry capacity, was Société Industrielle Belge des Petroles SA, at Antwerp, controlled 50-50 by BP and Petrofina; the SA Esso NV refinery at Antwerp had a capacity of about 225,000 barrels per day. Other large refineries were Texaco Belgium at Ghent (180,000), SA Chevron Belgium NB at Feluy (140,000), and the Albatros BNV refinery at Antwerp (100,000). Two small refineries completed the roster. Domestic consumption in Belgium was only about one-half the total capacity of the remaining plants, and the outlook for increased exports was bleak.

Uranium.—Under the uranium exploration project financed by the European Economic Community (EEC), Union Miniere, acting for the Belgian Mines Administration, was awarded BF20 million in 1979 for the examination of radioactive anomalies south of the Sambre-Meuse depression and in a 10-kilometer-wide strip north of it. Preliminary prospecting and soil sampling were planned. Total cost of the project was estimated at BF36.6 million, of which the EEC contribution was 55%; Union Minière was contributing 10% and the Belgian Government the remainder.

Northwest of Mons, values of uranium as high as 80 parts per million have been found in the transition beds between Dinantian and Namurian sediments, in a canal cut between Blaton and Nimy. In a quarry near Cuesmes, south of Mons, analyses as high as 53 parts per million were encountered in the Maastricht formation.[3]

LUXEMBOURG

Acieries Reunies de Burbach-Eich-Dudelange SA (ARBED) acquired 25.09% of Metallurgique et Miniere de Rodange-Athus SA (MMRA) in 1978, in a move to salvage the latter, a 1-million-ton-per-year producer. This was in line with the interim settlement announced in 1977 by the Belgian Government, which closed almost all the Athus plant on the Belgian side of the border and reduced the labor force at Rodange in Luxembourg. A new MMRA company was now set up, with the non-ARBED capital (Lux F1.275 billion[4]). The new firm is held by Cockerill and Ruau (20% each); the Luxembourg Government's Société Nationale de Credit a l'Industrie, the Cie. Bruxelles-Lambert, and Luxembourg banks (15.69% each); and the Belgian Government's Société Belge Industrielle (7.84%). MMRA's production program was to be integrated into ARBED's nearby Differdange works.

The McKinsey report on the Belgium-Luxembourg steel industry classified ARBED's installations as Class I (viable), Class II (doubtfully viable), and Class III (not viable). Among the Class I installations were Esch-Belval's A, B, and (the new) C blast furnaces, the two sinter plants, and the steelmaking plant along with the Differdange steelmaking plant. Class II installations included the Differdange blast furnace and sinter plant and the Esch-Schifflange steelmaking plant. The entire Dudelange plant was classed intermediate between Classes II and III, and the Rodange plant (formerly MMRA) was put in Class III.

ARBED's plans for modernizing and rationalizing its production, announced in 1977, were detailed in its semiannual report in October 1978. A 4-year Lux F18.5 billion (about US$600 billion) investment program would include improvements at all four major production sites. At Esch-Belval (where the new 4,000-ton-per-day blast furnace was inaugurated in November 1979), Lux F9.5 billion would go chiefly for new torpedo ladles to transport hot metal to Differdange and Esch-Schifflange, for a continuous bloom casting strand and a new 50,000-ton-per-month medium mill. At Esch-Schifflange, two new continuous bloom casting strands, rolling mill improvements, and melting shop improvements would cost Lux F4.1 billion; Lux F1.2 billion would enlarge capacity of the Grey section mill to 7,500 tons per month, and increase melting shop capacity at Differdange to 7,500 tons per day. Finally, at the Dudelange flat products works, about Lux F4 billion would extend cold rolling strip production. A loan of Lux F4 billion was granted late in 1979 by the European Coal and Steel Community to aid the improvements at the Esch-Belval, Esch-Schifflange, and Dudelange works.

ARBED managed to improve its steelmaking productivity during 1978 by 6%

from 6.9 to 6.5 man hours per ton, largely through a 17% cut in labor, improving its position but not yet eliminating its losses; the company has been operating in the red since 1974. In 1978, losses were Lux F1.9 billion, which it hoped to cut to Lux F500 million in 1979.

Only one Luxembourg mine was operated by ARBED during 1978 (plus three nearby in France). This was the underground Differdange mine, which produced 566,700 tons, compared with almost double that the year before in the same mine.

[1]Supervisory physical scientist, Branch of Foreign Data.
[2]Values have been converted from Belgian francs (BF) at the average rate of BF31.0=US$1.00 for 1978 and BF29.5=US$1.00 for 1979.
[3]Annales des Mines de Belgique. No. 5, May 1977, p. 251.
[4]The Luxembourg franc (Lux F) is equal in value to the Belgian franc.

[1]In addition to the commodities listed, Luxembourg also produces refractory clays and manufactured phosphatic fertilizers other than Thomas slag, but data are not published and information is inadequate to make reliable estimates of output levels.

The Mineral Industry of Bolivia

By Orlando Martino[1]

The downtrend in the rate of economic growth experienced by Bolivia in 1977 continued in 1978 and 1979, which had growth rates of 3.1% and 2.0%, respectively, compared with the high rate of 6.4% in 1976. The performance of the economy has fallen below the 7% growth rate targeted in the 5-year development plan that ends in 1980. The gross domestic product (GDP) grew to the equivalent[2] of $4.2 billion in current dollars in 1978 and to $4.9 billion in 1979.

Bolivia's mining industry contributed 7.1% of the country's GDP in 1978; its share has been declining since 1970 when the contribution was 9.2%. In 1978, the mining sector's contributions represented 23% of the Government's revenues. Bolivia's economy remained dominated by its export-oriented mineral industry, which was responsible for over 70% of the country's foreign exchange earnings. Bolivia's mineral production and exports continued to decline in most cases in 1978 and 1979, but rising world prices especially in silver and tin offset decreased output.

The value of exports of mineral commodities, not including petroleum and natural gas, increased 5% in 1978 to $516 million and 9% in 1979 to $565 million. Bolivia exported gasoline in 1979 but ceased to export crude petroleum in late 1978 because of domestic needs. As a result, the value of petroleum exports continued to decline, decreasing 37% in 1978 and 13% in 1979.

In 1978, a major milestone was reached in Bolivia's mineral history when more than 50% of the country's tin production was processed into refined tin. Since the revolution of the early 1950's, Bolivia had sought to install and expand its tin smelter capacity in order to gain the economic benefits of exporting refined tin instead of only tin ore and concentrate. In 1978, the Empresa Nacional de Fundiciones (ENAF), the major State-owned smelter, produced almost 16,000 tons of refined tin compared with 6,800 tons in 1971, its first year of operation.

In late 1979, Bolivia and the World Bank were in consultation regarding a multiyear assistance program. The proposed program would provide financing for the state mining company, Corporacíon Minera de Bolivia (COMIBOL), for mineral exploration and new mining equipment to improve productivity. The state petroleum company, Yacimientos Petroliferos Fiscales Bolivianos (YPFB), would receive financing for exploration and oilfield development as well as for the proposed natural gas pipeline between Bolivia and Brazil, provided that studies confirm the existence of adequate gas reserves.

Productivity of Bolivia's mineral industries has been hampered by the lack of investment by COMIBOL and the private mining companies in exploration to provide against the declining grade in ore deposits. To help solve this problem, the International Development Association (IDA)—the World Bank's affiliate for concessionary lending—approved a $7.5 million credit to provide financial, management, and technical support to the Fondo Nacional de Exploracion Minera (FNEM) established in 1977. The credit will assist the operations program of the exploration fund for the period 1979-82, estimated to cost $17 million.

FNEM will initially concentrate on financing exploration projects of privately owned small and medium mining enterprises as well as COMIBOL. FNEM was expected to finance general survey works for about 40 mining projects, about 25 preliminary studies and sampling, about 8 detailed reserve evaluation works, and 5 feasibility studies. Additional financing for FNEM will be provided through bilateral grants from the Bureau de Recherches Géologiques et Minières of France ($0.5 million) and from the Gesellschaft fur Technische Zusammenarbeit of the Federal Republic of Germany ($3.8 million).

Cognizant of Bolivia's unexploited mineral potential and recognizing Bolivia's lack of financial resources and necessary technology, in April 1979 COMIBOL announced its interest in entering into joint ventures to explore and develop the country's mineral deposits. COMIBOL was in the process of elaborating the basic conditions for such joint ventures with foreign mining firms on a nondiscriminatory basis. In late 1979, the head of COMIBOL became the new Minister of Mining and Metallurgy.

It has been long considered that the major impediment to increasing investment in Bolivian mining is the tax system for the sector. The Government was considering revising the tax system applied to COMIBOL and the private mining enterprises, but not reforming it. The revision would remove the 7.5% special export levy and raise the income tax to 53%. However, the 53% tax would still be imposed on the selling price minus a Government-set presumptive cost. Thus, it would not be a true profits tax, nor would it encourage exploration and development expenditures since these are not considered tax deductible "business expenses."

In February 1979, the Minister for Overseas Development announced in Parliament that the United Kingdom would resume its aid program to the Bolivian mining industry that had been suspended in 1977 on human rights grounds. The United Kingdom loan, equivalent to $40 million, was granted to the Government but designed to assist COMIBOL in reequipping a number of its mines.

PRODUCTION

Bolivia's decline in mineral production in the last 2 years was caused by persistent long-term factors and the sharply lower mine and smelter output in November and December 1979. The November slump was a result of the Natusch coup. The long-term weakening in production derived from: exhaustion of reserves, increases in production costs, declining mill recovery, deteriorating capital stock, and the continuing lack of investment in plant and exploration by COMIBOL and the private mining companies.

Mineral production in 1978 was generally at a lower level than that of 1977 with the notable exception of gold and silver. The downtrend continued for most commodities in 1979 except again for gold, which responded to higher world prices. Bolivia's output of tin, lead, and zinc suffered decreases in both 1978 and 1979, and bismuth had a severe decline in 1979. The drop in lead in 1978 is attributed to COMIBOL's operations despite the very favorable results of the medium miners.

Production of tin by COMIBOL, the main producer, is shown below in tons of fine metal:

Year	Quantity
1976	20,540
1977	23,251
1978	21,471
1979	19,000

In 1979, COMIBOL's output of lead decreased 25% to 9,526 tons, and zinc in concentrate decreased 29% to 27,413 tons.

The National Association of Medium Miners, established in 1939 and comprised of 25 companies, reported a sharp increase in lead (51%) and a small gain in tungsten (5%). Output by the medium miners in 1978 decreased.

While production of natural gas continued to increase, 4% in 1978 and about 2% in 1979, output of crude petroleum remained in its serious downtrend since the peak year of 1973.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the commodities listed, salt and a variety of crude construction materials (clays, crushed, broken, and dimension stone, and sand and gravel) are produced, but available information is inadequate to make reliable estimates of output levels.

[2]Unless otherwise specified, data represent actual production by COMIBOL and small- and medium-scale mines.

[3]Reported figure.

[4]Data represent exports and are regarded as being virtually equal to production.

[5]Cadmium contained in zinc concentrates produced by COMIBOL. (Cadmium is not recovered in elemental form in Bolivia.)

[6]COMIBOL output plus sales by placer mines. (Small- and medium-scale mines cannot legally export gold).

TRADE

Bolivia's exports of mineral commodities in 1977 and 1978 are given in table 2. Official data on imports of minerals and mineral fuels have not been available from Government sources on a regular basis since 1969. The import data for that year may be found in the Bolivia Chapter of Volume III of the 1972 Minerals Yearbook. The import data shown in table 3 covering 1971, 1972, and 1975 are the most recent data available.

The volume of exports of most leading mineral commodities decreased in 1978 and 1979 with the notable exception of antimony concentrate, which increased sharply in 1979.

Preliminary data on Bolivia's most important mineral exports in 1979 are given below in tons of fine metal content except as indicated:

Commodity	Volume	Value (million U.S. dollars)
Tin (refined, concentrate)	26,484	396
Natural gas million cubic feet	60,961	105
Silver thousand troy ounces	5,832	58
Zinc	53,923	43
Petroleum products thousand barrels	1,245	37
Tungsten	2,647	35
Antimony	13,266	22
Lead	15,633	18

The contributors to Bolivia's foreign exchange earnings in the minerals sector are as follows:

Entity	Export value (million U.S. dollars)	
	1978	1979
COMIBOL	193.0	169.9
Smelters (ENAF)	209.7	244.0
Medium miners	68.0	81.2
Small miners	42.2	61.8
Other exporters	2.9	8.1
Subtotal	515.8	565.0
YPFB:		
Natural gas	78.5	104.9
Petroleum	42.3	36.7
Subtotal	120.8	141.6
Total	636.6	706.6

In late 1978, COMIBOL temporarily suspended shipments of concentrate of tin, lead, and tungsten through the rail line to Antofagasta, Chile, to protest the rise in rail freight rates. The Antofagasta and Bolivia Railway company is British owned.

For the first time in 1978, the value of natural gas exported exceeded the value of petroleum exports, making natural gas Bolivia's second most important mineral export commodity after tin.

Exports of natural gas, all to Argentina, decreased in 1978 and then rebounded to a historic high in 1979 of almost 61 billion cubic feet. The 34% increase in export value in 1979 also benefited from an increase in renegotiated gas prices. Exports of crude petroleum continued to decline since the peak year of 1973 when almost 12 million barrels were exported. In October 1978, exports of crude petroleum were cut off to meet domestic demand. Petroleum exports in 1979 were primarily gasoline.

COMMODITY REVIEW

METALS

Antimony.—In 1978 and 1979, Bolivia ranked in second place after China as a world producer of antimony. Production of antimony metal remained below the full capacity of ENAF's antimony smelter rated at 4,270 tons per year.

In 1978, a National Committee of Antimony Producers was formed to promote the interests of the private miners (the major producers) and to work towards establishing an international antimony council.

Gold.—In response to high world prices, the gold-producing cooperatives and small miners produced 21,604 troy ounces in 1979 and accounted for 71% of Bolivia's output compared with the 55% share in 1977.

Iron Ore.—There were no new developments in Bolivia's plans to exploit the Mutún iron ore deposits near Santa Cruz. Project costs and lack of available financing as well as logistical problems obviated moving ahead at this time.

Iron and Steel.—The national steel plan submitted by the Empresa Siderúrgica Boliviana S/A (SIDERSA) was under review by the Ministerio de Coordinación y Planeamiento (CONEPLAN). SIDERSA's plan, centered on the Mutún iron ore deposit, was based on a feasibility study by Arthur McKee completed in September 1977. During the meeting of the World Bank consultative group in Paris, the Bolivian delegates were seeking foreign financing for the first phase of the plan involving 450,000 tons of steel per year.

Lead.—The mine operated by Quioma S.A., incorporated into the Medium Miners Association in 1977, was chiefly responsible for the sharp increase in lead output by this group in 1978. Quioma increased its output by more than 1,000 tons from 1977.

After delays caused by the austerity policies of the Government, construction of the lead-silver smelter at Karachi Pampa near Potosí, a joint venture of COMIBOL and ENAF, was expected to begin in early 1980 instead of March 1979 as originally scheduled. There was concern that Bolivia would not have sufficient lead reserves to feed the smelter designed to produce 24,000 tons of lead per year.

Tin.—In 1978, Bolivia for the first time succeeded in refining more than 50% of the tin concentrate produced. ENAF's smelter output at Vinto, however, was below its rated capacity of 20,000 tons per year and did not reach the output target for 1979. The 10,000-ton-per-year low-grade smelter that was originally scheduled for completion at Vinto in early 1979 was expected to be completed and tested in early 1980. Since this smelter was designed during a period of lower silver prices, it will not have the capacity to separate the silver contained in the feed, a potential financial loss to ENAF.

Construction of COMIBOL's tin volatilization plant at La Palca, near Potosí, by Soviet Machinoexport, was hampered by landslides that destroyed a considerable part of the plant. It was feared from the damage that the revised startup date of September 1979 would be moved to early 1981. There were no plans to convert the La Palca plant from fuel oil (in short supply in Bolivia) to use the country's abundant natural gas reserves until the plant is in operation.

Production and export of tin by COMIBOL and the medium miners were in a downtrend during 1978 and 1979. As a consequence, Bolivia lost to Thailand her long-held second place as a free world producer of tin. Loss of production in 1979 resulted from widespread strike action by the country's miners in the aftermath of the November political coup. Of the 25 private companies in the National Association of Medium Miners, 17 were involved in tin mining, producing 6,626 tons in 1978 and 5,937 tons in 1979 in terms of metal.

COMIBOL's tin reserve situation was expected to change if results of a prefeasibility study at its Catavi mine were substantiated by drilling. It is proposed to convert Catavi to mining by open pit, which could possibly begin in 1983 if justified economically. The drilling program was expected to be completed in mid-1979 on the deposit, estimated to contain 80 million tons of ore grading 0.3% tin.

Another step away from underground tin mining is the proposal to dredge the Playa Verde alluvial deposits at the Huanuni mine site downstream from Catavi. COMIBOL was being assisted by the Malaysian Mining Corp (another state entity) in assessing the viability of a project to produce 2,000 tons per year of tin.

The British Institute of Geological Sciences was cooperating with the Servicio Geológico de Bolivia (GEOBOL) in exploring tin deposits in the Departments of Beni and Santa Cruz. The first phase of the study initiated in early 1976 established the presence of alluvial deposits of tin, cobalt, and nickel. The second phase of the study is scheduled to end in 1981.

World tin prices continued in an upward trend, averaging $5.87 per pound in 1978 and $7.05 per pound in 1979 compared with $4.99 per pound in 1977. At the meeting of the International Tin Council in January 1979, Bolivia requested an upward revision of the buffer stock price levels. The fifth International Tin Agreement will expire in June 1981.

Tin sales from the strategic stockpile managed by the General Services Administration (GSA) of the U.S. Government were authorized by legislation signed by the President on December 29, 1979. The proposed sales had been strongly and persistently opposed by Boliva. The 35,000 tons authorized to be sold represents 17% of the 203,698 tons in the U.S. stockpile and were to be sold at biweekly auctions at the rate of 10,000 tons per year beginning in July 1980. Yearly sales by GSA would equal about 20% of 1978 U.S. tin imports, which were mostly from Malaysia and Thailand. In the period 1975-78, only 6% of U.S. tin imports were from Bolivia.

The GSA stated that it consulted with the International Tin Council before announcing the terms of the excess tin sales. The legislation signed also provided for a donation of 5,000 tons from the U.S. stockpile to the buffer stock of the ITC. GSA tin sales totaled 148,214 tons between 1962 and mid-1978 when GSA suspended commercial offerings. The peak year was 1964 when 31,147 tons were sold.

Tungsten.—Production of tungsten concentrate by COMIBOL, chiefly by its cooperatives of Kami and Bolsa Negra, increased 28% to 1,340 tons in 1979, while output by the medium miners (the most important producers) and the small miners decreased. Although the volume of exports decreased in 1979 to 2,647 tons, tungsten concentrate continued as Bolivia's fourth most valuable export commodity.

In March 1979, Bolivia hosted a gathering of tungsten producers in Santa Cruz, similar to the one held in La Paz in 1975, to consider the creation of a producer's organization with possibly some participation by interested consumer nations. At the meeting, attended by Australia, Bolivia, Brazil, Mainland China, Mexico, Peru, Portugal, and Thailand, it was agreed by Bolivia to delay plans for a possible producers' agreement until after the next two United Nations meetings on tungsten under UNCTAD.

Zinc.—Production of zinc concentrate was in a downward trend such that by the end of 1979 it was 28% below the peak level of 1977. COMIBOL's output increased in 1978, then dropped in 1979 to 27,413 tons. The subsidiary mining companies of Matilde, Quechisla, and Colquiri accounted for the bulk of COMIBOL's zinc production.

The significant decrease in zinc production by the medium miners was attributed to the closing down of Caballo Blanco S.A. of Potosí in September 1978 because of Government intervention. Output by this group of 20,975 tons in 1978 declined further to 16,728 tons in 1979.

NONMETALS

Boron.—Although production of boron minerals has been limited, apparently large resources of mostly ulexite (sodium-calium borate) provide potential for future exploitation. Production and export data have not been available since departure of an English mining company in 1952, when recovery of borates in southwest Bolivia was discontinued. Upon specific requests from COMIBOL and ENAF, small mining cooperatives have produced limited amounts of borates to meet the needs of the Telamayu bismuth smelter and refinery and the Vinto tin smelter. Currently the only state entity interested in borates is Cossmil (the Armed Forces Social Security Agency) with several borate concessions, including the large Salar de Challviri deposit.

Bolivia has a number of known deposits of borates in the southwest near Chile, and several have been evaluated in detail. Cossmil has evaluated the Rio Grande, Challviri, and Laguani borate deposits, while the deposits located in the salars of Capina, Pastos Grandes, and Laguna Colorado remain to be evaluated. Borate reserves are estimated at 65 million tons, of which 7 million tons are measured reserves.

MINERAL FUELS

Natural Gas.—For the first time in Bolivia's fuels history, the value of exports of natural gas exceeded the value of petroleum exports, as indicated below in million U.S. dollars:

	1976	1977	1978	1979
Natural gas	54.6	66.8	78.5	104.9
Petroleum	112.6	67.4	42.3	36.7
Total	167.2	134.2	120.8	141.6

After declining in 1978, exports increased to a new high in 1979 of 60,961 million cubic feet, an increase of 9.2%, valued at almost $105 million. All exports continued to go to Argentina. In 1979, gas exports represented 12% of Bolivia's total exports, compared with 8% in 1975.

The price of natural gas was renegotiated to $1.10 per 1,000 cubic feet effective January 1, 1978, increasing to $1.20 per 1,000 cubic feet for the period April-June 1978. During the second half of 1978 the price of $1.20 per 1,000 cubic feet was maintained. The rates agreed upon by Bolivia and Argentina for 1979 were $1.43 per 1,000 cubic feet effective January 1, 1979, and $1.54 per 1,000 cubic feet effective July 1, 1979. Another price revision took place in December 1979, effective as follows: $2.15 per 1,000 cubic feet on January 1, 1980, $2.42 per 1,000 cubic feet on May 1, 1980, and $2.51 per 1,000 cubic feet on June 1, 1980.

Bolivia and Argentina signed a second contract to increase the current volume of natural gas sold to Argentina to 220 million cubic feet per day.

Another notable event in 1978 was the startup of production at the Tita and La Vertiente Gasfields by the operations contractors, Occidental Boliviana Inc. and Tesoro Bolivia Petroleum Co., respectively. Also in 1978, Occidental discovered a new gas-condensate field, Porvenir No. 1, on the Chaco block northeast of Tarija in southern Bolivia. Occidental said its Porvenir Well has a potential of 17.6 million cubic feet per day of natural gas and 1,500 barrels per day of crude oil. By the end of 1978, the Tita

Field, discovered in 1976, was producing 50 million cubic feet per day of natural gas and 3,200 barrels per day of oil. The new Tita Field in 1978 became Bolivia's third most important gas producer, after the Rio Grande and Colpa Fields. Occidental's net share of production is 50% after payment of Bolivian taxes and royalties and is sold to YPFB in the field at the connections to YPFB's export pipeline system. During 1979, Occidental drilled a second gas-condensate well in the Porvenir Field, confirming significant reserves of gas and condensate.

In 1978 YPFB confirmed the discovery of a small gasfield, Rio Seco in the Department of Santa Cruz, and the discovery of Vuelta Grande in the Department of Chuquisaca, with promising reserves of natural gas and condensate.

In October 1978, Bolivia and Brazil signed a letter of intent covering future gas sales to São Paulo, Brazil, via a planned gas pipeline from Santa Cruz to supply 400 million cubic feet per day. The amount of gas reserves needed to implement the final contract will be determined with loans from the World Bank and the Inter-American Development Bank. Bolivia's largest gas reserves are located north and northwest of Santa Cruz, an area being held in reserve to supply the planned gasline to Brazil. At the end of 1978, Bolivia's proved reserves of natural gas were estimated at 5.99 trillion cubic feet. At current rates of consumption, proved gas reserves would last 60 years.

Petroleum.—During 1978 and 1979, the downward trend in the production of crude petroleum continued since the peak year of 1973 when 17.3 million barrels were produced. In October 1978, for the first time in 25 years, Bolivia discontinued exports of crude petroleum destined primarily for Argentina. This resulted from the decrease in oil production coupled with increases in domestic consumption of 5.4% in 1978 and 11.5% in 1979. Bolivia's crude oil output by field is given in table 4 and includes output from the new oilfields of Vuelta Grande, Tita, Porvenir, and La Vertiente.

Table 4.—Bolivia: Production of crude oil and condensate by YPFB and contractors,[1] by field

(Thousand 42-gallon barrels)

Field	1975	1976	1977	1978	1979	Percent change 1978-79
Rio Grande	4,578	5,412	5,080	4,660	4,233	-9

Other fields	[2]108	[3]50	[4]155	[5]61	[6]27	-56
Total	14,732	14,856	12,676	11,844	10,169	-14

[1]In 1978, Occidental produced from the Tita Field and Tesoro from the new La Vertiente; in 1979 Occidental's Porvenir Field entered production.
[2]Includes output from Los Monos, Buena Vista, and Tigre.
[3]Includes output from Los Monos, Buena Vista, Tigre, and Montecristo.
[4]Includes output from Los Monos, Buena Vista, Montecristo, and Espejos.
[5]Includes output from Buena Vista and Espejos and a small amount from Tigre. Los Monos was shut down.
[6]Includes output from Vuelta Grande, Buena Vista, Espino, and Porvenir.

The prospect that Bolivia would soon become a net importer of crude oil to meet domestic needs, especially for diesel oil, fuel oil, and kerosine, has been avoided by the possibility of increasing production from the new La Vertiente Field. Output from La Vertiente, under operations contract with Tesoro, can possibly be increased to 10,000 to 12,000 barrels per day, or one-half of domestic consumption.

The prices for most refined petroleum products were among the lowest in South America. Prices for refined products were raised in November 1979, but to a level well below that indicated by world oil prices. The low prices have encouraged a high level of petroleum product contraband to Paraguay and Brazil. The refining and sale of hydrocarbon products in Bolivia was performed exclusively by YPFB, the state oil company. YPFB operated six refineries with a total capacity of 84,600 barrels per day, compared with current refinery production of 26,000 barrels per day. This capacity includes the expansion of the Valle Hermoso (Cochabamba) refinery completed by A.G. McKee in November 1978 and the Palmasola (Santa Cruz) refinery. The new refinery capacity places Bolivia in a position to be able to increase exports of petroleum products.

In 1978 YPFB signed only one operations contract with Tesoro Bolivia Petroleum Co. covering an area in the Department of Tarija. This brought to 20 the total of contracts signed by YPFB with foreign oil companies since 1973, of which only 6 were active as of the end of 1978. By yearend 1978, the contractors had invested $199 million in the same period. YPFB invested $110 million in exploration and development. During 1978 and 1979, the total of 11,240 meters drilled in exploratory wells was the highest ever.

As of December 1979, estimated reserves of crude oil were 170 million barrels, including new discoveries. At 1979 rates of production, the country's proved reserves would last about 16 years.

Uranium (Nuclear Fuels).—In February 1979, the Government and the Compagnie Générale des Matières Nucleaires (COGEMA) of France executed a letter of intent covering a $10 million exploration program in eastern Bolivia for commercially exploitable uranium. The Bolivian Nuclear Commission (COBOEM) will act for the Government in contracting with COGEMA.

The COGEMA venture represents the second major attempt to find uranium in Bolivia. During 1974-78 AGIP, a subsidiary of the Italian Government, spent about $7 million prospecting in the Bolivian altiplano and in the South. Although radiometric sensing of the exploration area showed encouraging anomalies, the deposits proved too shallow to exploit commercially.

The Mineral Industry of Botswana

By Janice L. W. Jolly[1]

Botswana's mineral industry was the fastest growing sector of the economy in 1978 and 1979, providing a major portion of foreign exchange earnings and a substantial share of Government revenue. Diamond earnings nearly doubled during 1978, accounting for 58% of the total 1978 mineral production value of approximately $160 million[2] and 68% of the total 1979 mineral production value of $296 million. Although nickel-copper matte production increased by 28%, lower prices for the contained metals resulted in receipts that were similar to those of 1976 and 1977. Expansion at the Orapa and Letlhakane diamond mines continued, and a final agreement for development of the new Jwaneng mine was signed. Despite major financial restructuring and other cost-containment exercises, the debt of BCL Ltd. (formerly Bamangwato Concessions Ltd.) increased again. Planned expansions at Pikwe and Selibe continued, funded by the principal shareholders.

Mineral exploration for coal, uranium, asbestos, and base metals was underway in various parts of the country. The final report of the airborne magnetic survey conducted by the Canadian International Development Agency (CIDA) and the Botswana Geological Survey Department was released. The report indicated a positive potential for many minerals under the Kalahari sands, which cover nearly 80% of the country. The magnetic data outlined the most favorable areas for mineral occurrences and also showed the thickness of Kalahari sediment cover. A thick sedimentary basin was outlined in southwestern Botswana, holding a potential for petroleum exploration. An extensive follow-up program that was expected to include drilling was being planned by the Geological Survey. Also, a record number of 69 maps was completed for the Botswana Government for the year ending March 31, 1978, according to the British Directorate of Overseas Survey (DOS), which was doing the surveys. Covering the Okavango and Boteli Rivers and much of the country's northeastern area along the Botswana-Zambia Highway, the maps were made on a scale of 1:50,000, and these maps were expected to assist in mineral exploration. The Botswana Government was negotiating with Japanese, West German, and Canadian delegations for technical and financial assistance in mineral exploration. Falconbridge Mines of Canada held several prospecting licenses and was actively exploring for precious stones, copper, nickel, gold, silver and radioactive minerals.

A new mining policy (Act 30, 1976, S.I. 175, 1976) was announced that was designed to promote foreign investments and bring the law into line with requirements of an expanding mineral industry. Under the policy, the award of a mining lease to the holder of a prospecting license was to be fully guaranteed, providing the economic potential of the mineral discovery was demonstrated.[3]

At the Southern African Development Coordination Conference held at Arusha, Tanzania, in July, 1979, Botswana urged an economic integration of the 10 states in southern Africa outside of the Republic of South Africa. Specifically, a trans-Kagalagadi railway line and a road from Francistown to Namibia and Angola were recommended to encourage trade and communications between the three countries. This would frustrate current recommendations by the Republic of South Africa for a "Constellation of Southern African States" and lessen dependence on southern transport routes.[4]

PRODUCTION AND TRADE

In 1978, the mineral production of Botswana consisted of coal, valued at $2.8 million; nickel-copper matte, valued at $62 million; diamond, valued at $92 million; semiprecious stones, valued at $3,600; and talc, crushed stone, sand and gravel, valued at $1.3 million. By 1979, Botswana had become the world's fourth largest producer of diamond, with revenues from diamond estimated at over $200 million and its share of world output was expected to increase as a result of anticipated new production. World demand for diamonds remained buoyant in 1979, and the high prices realized in 1978 were maintained. Although operating costs for BCL Ltd. were contained during 1978, the benefits of increased production were offset by lower nickel prices (which averaged $1.97 per pound in 1978, compared with $2.19 per pound in 1977).

Total exports, valued at $221 million in 1978 and $325.7 million for the first three quarters of 1979, reflected increased earnings from diamond, following substantial price increases for the three consecutive years. Diamond exports accounted for 41% of Botswana's total exports in 1978 and for 46% in 1979.[5] Prices for cobalt more than doubled, following a period of unrest in Zaire. Total imports rose sharply to $353 million, partly due to the influx of capital equipment and other materials for the new Jwaneng diamond mine. Copper-nickel matte exports were valued at $61 million in 1978 and $56 million for the first three quarters of 1979. The demand for nickel did not improve in 1979, but prices for copper continued to rise.

In 1976, Botswana became eligible for the United States General Selected Preferences (GSP) Trade Act benefits. However, the country's copper-nickel matte was imported into the United States under the import classification for copper matte. Because BCL's copper matte imports into the United States accounted for 89% of total U.S. copper matte imports for 1976, Botswana lost GSP eligibility. The GSP Act stipulates that a material imported for consumption must not exceed the competitive need limit for an import category. In 1978, AMAX Refining requested that the material be reclassified under a more appropriate category, such as nickel-copper matte, since the matte contained more nickel than copper, as well as the strategic material cobalt. Nickel, copper, and some cobalt were being sold to the Federal Republic of Germany, after processing at the AMAX Port Nickel refinery in Louisiana. During 1979, BCL was temporarily forced to cease exports to the United States because of a strike that led to a temporary closure of the Port Nickel plant.

The Botswana pula was revalued by 5% against the U.S. dollar on September 16, 1979, so that one pula was equal to 1.2679 U.S. dollars. The revaluation was aimed at reducing the cost of imported goods.

Botswana was seeking a maritime entry on the southwest African Coast. A proposal for building a railroad between Botswana and the Atlantic Ocean, across the Kalahari Desert, was being studied. The Commonwealth Technical Cooperation Fund was expected to participate in the study. The Government was also taking steps toward taking over that part of the Rhodesian-owned railroad which runs through Botswana to South African ports, with a view towards a complete takeover. The railroad, still operated by Rhodesia Railways, has been termed the economic lifeline of Botswana, since it carries most of the territory's mineral exports and imports. Botswana took delivery of its first South African-built railroad cars in May 1978.

Table 1.—Botswana: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]

COMMODITY REVIEW

METALS

Copper-Nickel-Cobalt.— Selebi-Pikwe started production in February, 1974, 33 months after initial construction started. BCL Ltd. operated the concession and was owned 15% by the Government and 85% by the Botswana RST (BRST). The name of BRST's subsidiary, Bamangwato Concessions Ltd., was changed officially in 1977 to BCL LTD. BRST was owned 11.75% by Zambia Consolidated Investments (ZCI), 29.8% by AMAX, 30% by Anglo American/Charter Consolidated, and the remainder by the public. German involvement, including the West German Bank Kreditanstal fur Wiederauf (KfW), was about one-third of the total initial capital involved in mine development. Production and management problems and a soft metal market combined to make the first two years a financial loss. New management and technical expertise were brought in and many of the initial problems were solved by late 1976. Still, there remained huge debt servicing problems. A complex restructuring move on July 1, 1979, involved Charter Consolidated Ltd. Group, Minerals and Resources Corp. Ltd. (MINORCO), Anglo American Corp. of South Africa Ltd., De Beers Consolidated Mines Ltd., and Zambia Consolidated Investments (ZCI). ZCI transferred 19.7% of its preference share capital in BCL to De Beers, while retaining its 11.75% interest in BRST. In return, De Beers agreed to relieve ZCI and MINORCO of debt obligations to BRST and BCL, that amounted to $18.4 million, which had been borrowed to finance the mine.

AMAX, however, wrote off its entire carrying value ($91.7 million) in BRST, and the debt and marketing arrangements between the other investment partners were renegotiated and concluded on March 16, 1978. Under the new agreement, all of BCL's production was sold as matte to AMAX Nickel. High sales commissions paid previously to Metallgesellschaft AG of the Federal Republic of Germany were no longer payable, and a claim by AMAX for $8.7 million for a shortfall in matte delivery was settled for $1.5 million. Various claims made by Metallgesellschaft were also settled by a payment of $450,000, of which AMAX paid $180,000. The outstanding balances of loans from KfW and the Industrial Development Corp. of South Africa were reduced by prepayments without premium. BCL's principal shareholders agreed to provide two additional guaranteed loans, or other financial support, for pollution control and the second phase of BCL's mining project at Selebi.

An Outokumpu flash smelter and a sulfur-reduction plant had been originally teamed to recover sulfur at Selebi-Pikwe. The sulfur was to be sold to Triomf Fertilizers, but when the sulfur was not delivered, Triomf initiated a suit for alleged damages.

The suit was settled in 1978 for $3.9 million, but BCL remained liable for sulfur-pollution problems. BCL was relieved, however, of the obligation to produce sulfur for delivery to Triomf in the future under a process that had been shown not to be commercially viable. The royalty paid to Botswana was also renegotiated at 3% of the gross production value, compared with the 7 1/2% royalty on profits that was originally paid.

Despite the major financial restructuring and an improving metals market, BCL's debt increased again in 1978. By June 30, 1978, accumulated indebtedness amounted to $266 million. Capital expenditure for the year was put at $34 million, and further substantial amounts were needed. During the first 6 months of 1979, BCL Ltd. reported an operating profit of $8 million, compared with a loss of $240,000 for the corresponding 1978 period. Higher cobalt and copper prices coupled with increased production were responsible for the recovery. Production costs were contained, despite an overall inflation rate of 8.7% for the 12-month period ending with March 1979. Even though a profit was not made in 1978, a 28% increase in nickel-copper matte production was achieved in that year. The reasons for this increase included better underground mining rates and concentrator recoveries, operation of a new system for reclaiming stockpiled residues accumulated from previous years, and improved smelter furnace availability and smelting rates. Matte production and its estimated average metal content are shown below for 1975-78.

	1975	1976	1977	1978
Matte production metric tons	16,513	32,506	30,772	39,517
Matte content:[1]				
Nickel percent, average	37.9	36.5	39.3	40.6
Copper do	39.8	36.7	38.3	36.9
Cobalt do	.34	.41	.54	.66

[1]Average content for sulfur and impurities was 22% for each of the years shown.

As part of a planned expansion project, the No. 3 shaft at Pikwe was to be sunk to about 900 meters for deep-level mining, and surface facilities extended; the total cost was estimated at about $94 million. This would allow access to an additional 15 million tons of ore reserves. Existing underground operations were at a depth of about 350 meters. Funding for the expansion project was expected to be supplied by the principal shareholders. The smelter shutdown originally scheduled for July-August 1979 was rescheduled for 1980, when final commissioning of remaining plant projects was scheduled to take place.

NONMETALS

Clays.—Various types of clay materials were exploited for local use. Local brickmakers use the clays of flood plain and terrace deposits of the Peleng River, in the Lobatse area, and of the Notwani River, near Gaborone. Potential fireclays such as the Mmamabula fireclay occur in the Ecca Series of Karoo Age, but none was being exploited. Traditionally sought for making pottery are the clays from river banks and termite mounds, which have a high degree of plasticity. For instance, clay from Phaphane Hill, Mochudi, which resulted from weathered granite, was used by villagers at Morwa.[6]

Diamond.—De Beers Botswana Mining Co. (Proprietary) Ltd. reported production at the Orapa mine as 3,585,400 tons with a recovery grade of 68.5 carats per 100 tons, yielding 2,454,405 carats for 1978. This compared with a recovery grade of 67.98 carats per 100 tons and a yield of 2,345,010 carats in 1977. As a result of a 2-month delay in construction of the Orapa expansion project and other commissioning problems at the treatment plant, total tonnage treated in 1978 was 18% less than the target of 4.4 million tons. Major construction work on the Orapa plant expansion was completed, and the new facilities were commissioned in October 1978.

Mining of the ferruginous gravels surrounding the D/K1 and D/K2 diamond pipes continued at the Letlhakane mine. Mining of the D/K1 pipe itself started during the latter part of 1979. Heavy rains in early 1978 interrupted operations, but the 1.1 million tons treated during the year compared favorably with the amount treated in 1977. The recovery grade was 29.74 carats per 100 tons. Construction of the second stage of the Letlhakane plant was completed on schedule during the first half of 1979.

An agreement was signed between the Government and De Beers on April 11, 1978, for development of the new Jwaneng mine. Under the agreement, the mine will be developed as a joint venture by De Beers (50%) and the Government (50%). The Botswana Government exercised its option to subscribe up to 20% of the paid equity required for the project. A feasibility study on the new mine, prepared by Anglo American, based the projected treatment rate on a mine output of 400,000 tons per month. The mine was expected to start commercial production in mid-1982. A bulk sampling plant was erected in 1979 to assist in more detailed evaluation of ore reserves. It was estimated that the ore grade from Jwaneng would be higher than that of the Orapa mine, and that the Jwaneng mine would produce about 20% gem stones. A major groundwater resource was confirmed during 1978 that was expected to be sufficient for the mine's needs. At yearend 1978, work was in progress on the Kanye-Jwaneng main access road, the airfield, and the telecommunications facilities.[7] Construction of a new township was started in 1979.

Botswana signed an agreement in 1979 with Mabrodiam of Antwerp, Belgium-Luxembourg, to set up a diamond-cutting plant in Gaborone. Initially, a pilot plant employing 50 people was planned, eventually building up to 500 employees. The company is expected to start operations in 1980.

Botswana's diamond resources were estimated as follows: 60 million carats proven; 25 million carats identified; and 25 million carats undiscovered[8]. As part of a continuing prospecting program, De Beers was testing three small kimberlite pipes about 370 kilometers north of Orapa.

Soda Ash.—Toward the end of 1978, a Japanese consortium was given permission to evaluate the Sua Pan salt and soda ash deposit for eventual exploitation. Only part of one of the two great pans (the Sua Pan) of the Makgadikgadi Basin had thus far been investigated. Initial exploration of this area was carried out by the Botswana Geological Survey in the Nata River delta. Later investigations were carried out by Makgadikgadi Soda Ltd. under prospecting license. The better brines were determined to be in the northwestern part of the Sua Pan, rather than in the Nata delta. A 900-square-kilometer area was delineated as potentially commercial brine. Sampling revealed a homogenous brine that could yield soda ash, common salt, salt cake (Na_2SO_4), and potash (KCL). The total quantity of brine in the northern Sua Pan has been estimated at 7.2 billion cubic meters containing 140 million metric tons of soda ash and 860 million tons of common salt. The brine also contains about 0.9% sodium bicarbonate, 0.4% potassium chloride, and 1% salt cake, and is 84% water. Pilot tests have indicated that all salts can be separated and extracted successfully.

MINERAL FUELS

Coal.—The Morupule Colliery, operated by Anglo American, produced over 300,000 tons per year and was expected to reach an output of about 1 million tons per year by 1980. The coal was used for electricity generation and for the needs of the Selebi-Pikwe mine. At Morupule, the coal reserves were in two main seams; the upper seam was 18 feet thick and was separated by about 70 feet of sandstone from the lower seam, which was 8 feet thick. Reserves were given as 4 billion metric tons of proven reserves, plus an additional 13 billion tons of indicated reserves[9]. Shell Coal Botswana was actively exploring for additional resources. The coal occured mainly in eastern Botswana in Karoo sediments of Late Carboniferous to Jurassic age. Coal has also been discovered in western Botswana near the Namibian border. Botswana's large coal resources were estimated at 40 billion tons. Several geological investigations were expected to be conducted over the next 3 years in central Botswana to determine the continuation of Karoo sediments and coal in these areas. Botswana coal was classified as steam coal having a medium heat content, a medium ash content, and a low sulfur content. No coal was exported, owing to a lack of bulk loading facilities. During 1979, a mission from the Japanese Ministry of International Trade and Industry visited both the Morupule and Mmamabula coal fields to determine the potential for both buying and developing Botswana's coal. The Government was considering plans for construction of a coal-liquefaction plant to manufacture gasoline for local use.

Petroleum.—Construction began in December 1978 on two oil-storage depots at Francistown and Gaborone that were designed to give Botswana a 3-month supply of oil in case imports are interrupted. West Germany was financing the construction costs, and the stocking costs were to be partly financed by the Botswana Government and private oil companies (BP Botswana, Shell Botswana, Caltex Oil, Mobil Oil Botswana, and Total South Africa). Petroleum product imports for the period from January to September 1978 were valued at

$21.9 million.

The Mineral Industry of Brazil

By Orlando Martino[1]

Brazil's economy in real terms grew by 6.3% in 1978 and 6.5% in 1979 compared with the 4.7% rate in 1977. The gross domestic product (GDP) in current prices increased to \$191 billion[2] in 1978 and an estimated \$213 billion in 1979. The rate of inflation in 1978 was 41%, the level of recent years, but increased to 77% in 1979, the highest rate since 1964.

The Government was developing policies to reduce the trade deficit that surged in 1979 by limiting imports and to reduce inflation by restraining the spending by Brazil's many public companies. At yearend 1979, it was not apparent how these policies would affect the priorities and investment programs in the mineral sector.

In the 5-year period ending in 1978, Brazil's mineral industry experienced strong growth, increasing at an average of 26% per year. In 1978 the value of mineral output increased 38% to \$4.0 billion compared with \$2.9 billion in 1977. The value of mineral output is estimated at \$4.8 billion for 1979.

The contribution of Brazil's mineral industry to the national economy is estimated at about 2% GDP but the industry is more important in Brazil's exports. Exports of commodities with mineral origin accounted for 18% of total export value in 1978. The value of iron ore exports alone in 1978 was 8% of the total.

Brazil in 1978-79 continued as an important producer and exporter of iron ore, manganese, pyrochlore concentrate and ferrocolumbium, electronic-grade quartz crystal, and gem stones. The leading mineral commodities produced in terms of value were petroleum, iron ore, crushed stone, limestone, coal, marine salt, manganese, bauxite, gold, pyrochlore, tin, and natural gas. Brazil's metallic and nonmetallic industries comprise about 116 companies with total assets of about \$3.6 billion. In terms of capital, the dominant mineral company was Companhia Vale do Rio Doce (CVRD), a corporation under the jurisidiction of the Ministry of Mines and Energy, followed by Samarco Mineração S/A, Amazonia Mineração S/A, Mineração Rio do Norte S/A, and Mineração Morro Velho S/A. The mineral fuels sector was dominated by the state-owned oil company Petroleo Brasileiro S/A (PETROBRAS).

It is estimated that 80% of Brazil's mineral industry is controlled by the state; 15%, by foreign companies; and only 5%, by private domestic companies. The Government was studying measures to increase the participation of Brazil's private sector in its mineral development. Toward this end, the Ministry of Mines and Energy reactivated in April 1979 the Conselho Superior de Mineração created in 1965. It was decided that no state company could request an exploration license (other than for petroleum or uranium under monopoly control) without having consulted private companies. It was also decided to restrict the future operations of CVRD. In the Serra dos Carajas region, for example, CVRD would be required to limit itself to iron ore exploration while private initiative would be applied in the exploration of copper, gold, lead, zinc, and manganese. As another example, the Government was considering reducing CVRD's 60% ownership in the Valesul aluminum project to 40%. The Ministry of Mines and Energy also announced that fertilizers would be the next group in which state participation would be reduced.

As a first step in reducing state ownership of industry, the Brazilian National

Development Bank (BNDE) announced in mid-1979 its plans to sell to the Brazilian private sector 7 out of 228 firms in which the Government has significant stock. The first group included the copper companies Caraiba Metais S/A and Brasileira de Cobre S/A. Caraiba Metais S/A is a subsidiary of Insumos Basicos S/A - Financiamento e Participações (FIBASE), an agency of BNDE.

Brazil continued its significant program of investments in the mineral sector. It was estimated that the funds invested in 1978 for exploration, mining, beneficiation, facilities, and metallurgical research would quadruple by the end of the period 1979-80. During 1978, the highest amount invested was in iron ore followed in order by limestone, gold, fertilizers, copper, aluminum, and coal. For the period 1979-80, investment funds would be devoted to iron ore - 31%, aluminum-bauxite - 29%, copper - 13%, nickel - 8%, and fertilizers - 6%. During 1979 about 30 projects were being implemented in mining and metallurgy.

Significant progress continued to be made in Brazil's active nonferrous development program. Especially notable was the startup of the Trombetas bauxite project in 1979, the implementation of the Caraiba copper project, and the attainment of self-sufficiency in electrolytic nickel. In other mineral sectors, Brazil continued to expand its steel-making capacity as well as its production and exports of ferroalloys. During 1978-79 Brazil also increased the number of producers of phosphate rock and greatly augmented the country's fertilizer capacity. The Conselho Nacional de Nao-Ferrosos e Siderurgia (CONSIDER) projected that $2.6 billion would be invested before 1985 for projects already approved in the nonferrous plan or for projects with funds committed.

Data from the Departamento Nacional da Produção Mineral (DNPM) of the Ministry of Mines and Energy indicated substantial increases in the measured reserves of titanium (anatase) - 430%, pyrochlore - 300%, copper - 180%, beryllium - 160%, lithium - 130%, uranium - 130%, iron ore - 40%, and gold - 36% as well as a number of nonmetallic ores. Measured reserve figures published by DNPM are those which are officially approved by the Government on the basis of annual mine reports (Relatorios Anuais de Lavras - RAL) and final reports on exploration work.

PRODUCTION

Preliminary data on production of mineral commodities for 1978 is given in table 1 with provisional or estimated data for 1979. Output of iron ore recovered in 1978-79 from the depressed level of 1977 but fell short of the peak year of 1976. There was also improvement in the output of manganese ore. Strong growth continued in the production of steel and ferroalloys. Startup of the Trombetas project was the cause for a historic high in 1979 in the production of bauxite. Advances continued in Brazil's nonferrous program especially in the metals aluminum, tin, and zinc.

Among the mineral fuels, output of coal reached new levels, and output of natural gas in 1978 was higher than in the previous year. The downward trend in the production of crude petroleum was reversed in 1979 but was below the 1974 peak.

DNPM reported that 70,000 persons were employed in the mining sector in 1978 mostly in the States of Minas Gerais - 36%, Santa Catarina - 12%, São Paulo - 10%, and Bahia - 7%. The mineral commodities absorbing the greatest labor were iron ore - 16%, coal - 14%, limestone - 11%, mineral water - 7%, gold - 6%, and tin (cassiterite) - 4%. The labor force of PETROBRAS totaled 60,700.

Table 1.—Brazil: Production of mineral commodities

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed, molybdenite and bismuth are produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.
[2]Represents total estimated production, including the amount reported as sold by the Garimpos to Government agencies.
[3]Reported figure.
[4]Smelter and/or refined metal.
[5]Includes baddeleyite-caldasite.
[6]Exports.
[7]Revised to none.
[8]Less than 1/2 unit.
[9]Apparently includes crude quartz used to produce quartz crystal (listed separately in this table) as well as additional unreported quantities of common quartz.
[10]Produced from a portion of the crude quartzite listed above; crude quartzite processed was as follows, in metric tons: 1976-206,036; 1977-157,531; 1978—NA; and 1979—NA.

TRADE

In January 1979 the National Monetary Council adopted resolutions to initiate a significant liberalization of the Brazilian trade system. The principal decision was to phase out certain export subsidies and the 360-day 100% import deposit requirement. At the same time the Government intended to accelerate the pace of exchange rate adjustments while continuing the crawling peg system. However, in December 1979 a "maxi-devaluation" of 30% was announced, a deviation from the crawling peg exchange rate system for the first time in over 10 years, giving a total devaluation in 1979 of 103%.

After achieving an overall trade balance in 1977, Brazil had a trade deficit in 1978 of $1.0 billion that increased to $2.7 billion in 1979. Although total exports increased in value from $12.7 billion in 1978 to $15.2 billion in 1979, imports grew to a greater extent from $13.7 billion in 1978 to $18.0 billion in 1979. Oil and other fuel imports increased in value by over 50% from $4.5 billion in 1978 to $6.9 billion in 1979. In spite of the deficits in 1978 and 1979 the World Bank projects a trade surplus of almost $5 billion for Brazil by 1985. Manufactured goods are expected to become the leading export sector growing from 24% of Brazil's total exports in 1976 to 37% of exports in 1985. This growth in Brazil's output of manufactures will place a strong demand on the country's mineral industries.

According to data prepared by DNPM, the mineral sector was the principal factor in Brazil's trade deficit. Imports of commodities of mineral origin in 1978 grew 9% to $6.98 billion while exports of mineral commodities grew substantially by 40% to $2.04 billion. This gave a mineral trade deficit of $4.94 billion in 1978.

Among the exports of primary mineral commodities in 1978, the most important in terms of values were iron ore - 87.9%, manganese ore - 4.1%, gem stones - 3.3%, and columbium-tantalum concentrate - 1.7%. After a decline in 1977, iron ore export sales increased 13% to $1.028 billion in 1978 and 25% in 1979 to $1.3 billion. Exports of iron ore pellets increased fourfold in 1978. The World Bank study projects iron ore exports to increase to $2.2 billion in 1980 and $5.7 billion in 1985. This projection is based on the assumption of a recovery in world steel production and a marked increase in iron ore prices in the early 1980's. Exports of steel products in 1979 increased to $467 million, while imports of the same were $621 million.

Brazil has become an important world producer and exporter of ferroalloys. Exports of a variety of ferroalloys have increased sharply from about 21,000 tons in 1971 to about 172,000 tons in 1979. During 1979 the United State was considering the need to apply a countervailing duty against the imports of Brazilian pig iron, the production of which is concentrated in the State of Minas Gerais. In December 1979, the U.S. International Trade Commission initiated an investigation, having received advice from the U.S. Treasury Department that bounties or grants are being paid to Brazilian producers with respect to pig iron imported from Brazil, entered duty free.

As for imports of minerals and mineral-related commodities, this value in 1978 was composed of crude petroleum - 63%, nonferrous - 7%, fertilizers - 5%, and coal - 4%. Decreases in imports in 1978 were notable in ferroalloys and steel - 23%, copper - 18%, aluminum - 15%, and petroleum derivatives - 28%. Total imports from the United States in 1978 were almost 21% of Brazil's overall imports, dropping to a 17% share in 1979.

Trade between Brazil and Mainland China was expected to reach a historic level of over $200 million in 1979, compared with the $9 million of trade in 1976. Brazil would then replace Cuba as China's main trading partner in Latin America. In November 1978, a first-ever ministerial-level trade mission from Brazil visited China. Under the 5-year trade agreement signed, Brazil is to export iron ore, pig iron, and steel products in exchange for Chinese petroleum. Brazil agreed to supply China with 2.5 million tons of high-grade iron ore during 1979 and 1980 and was negotiating a long-term agreement covering the next 10 or 15 years. Brazil hoped to satisfy 15% of China's iron ore needs.

CVRD formed a new subsidiary corporation, Rio Doce America Inc., under the laws of the United States to promote the U.S. contacts of all the companies in the CVRD group.

Table 2.—Brazil: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite and concentrate	3,654	4,005	Argentina 2,435; Uruguay 1,520.
Oxide (alumina) and hydroxide[1]	145	772	Japan 307; Argentina 267; Bolivia 83.

COMMODITY REVIEW

METALS

Aluminum-Bauxite.—The major event of the period was the startup in June 1979 of the Trombetas bauxite project in the Amazon Basin in the State of Pará by Mineração Rio do Norte S/A (MRN), a consortium of domestic and foreign companies led by CVRD. Construction of the project began in April 1976 and is expected to be completed in April 1981 at an estimated cost of $423 million compared with the 1975 estimate of $260 million.

Technical assistance for the Trombetas project was provided by CVRD and Alcan Aluminio da America Latina. ALCAN was responsible for the mining, crushing, washing, and drying facilities, while CVRD was in charge of the railroad and shipping areas. The ship loader at Porto Trombetas was designed by Soros Associates, New York City, and manufactured by Italimpianti, partly in Italy and partly in Brazil.

With the initial shipment of bauxite in August 1979, Brazil became an exporter of bauxite for the first time in recent history.

Output of 2.6 million tons was projected for Trombetas in 1980, its first full year of operation. Under Phase I plans for the Trombetas project, full capacity was expected to be reached in 1982 at 3.35 million tons of bauxite. The capacity, schedule, and cost of the Phase II expansion was under study.

Engineering studies and cost estimates were completed on the Paragominas bauxite project of Mineração Vera Cruz S/A, a joint venture of the Rio Tinto Zinc Corp. and CVRD, which acquired a 36% interest in 1977. The project, located near the town of Paragominas in the State of Pará, is designed to produce 4 million tons per year of dry beneficiated bauxite. Reserves were estimated at 275 million tons of crude ore with total alumina of 56%.

According to studies by the Brazil's Ministry of Mines and Energy[3] consumption of aluminum is expected to increase from 11% to almost 15% per year during the period 1981-86. Consequently, total demand for aluminum is expected to reach 1 million tons while domestic primary supply would increase to almost 750,000. Planned expansions of current plants and new projects such as those of Valesul and Albras would not be sufficient to eliminate Brazil's dependency on imports of aluminum ingot in the foreseeable future.

Valesul Aluminio S/A (Valesul), under the control of CVRD, was expected to start up its new 87,000-ton-per-year aluminum plant in Santa Cruz, State of Rio de Janeiro, at the revised date of 1981. Valesul's $370 million project received a World Bank loan of $98 million in March 1979. Alumino Brasileiro S/A (ALBRAC) will start operations in 1983 at the initial capacity of 40,000 tons of aluminum per year, to increase to 320,000 tons by 1987.

Chromium.—Projections made by the Ministry of Mines and Energy[4] indicate that Brazil will continue to have a surplus of chromite and ferrochromium for export until 1987 when the output would be 625,000 tons and 180,000 tons, respectively. In 1978, exports of chromite (all to Japan) increased, but the c.i.f. value decreased to $4.9 million. In the same year the decreased exports of ferrochromium were valued at $14.9 million.

It appeared in 1979 that the Japanese interests would withdraw from the joint venture, Companhia de Mineração Serra da Jacobina (SERJANA), formed with Brazil's major chromite and ferrochrome producer, Cia de Ferro-Ligas da Bahia S/A (FERBASA), operating at Campo Formoso in Bahia. The greatly increased cost of shipping chromite to Japan and a planned reduction in Japanese ferrochrome capacity were given as the main reasons for the Japanese withdrawal.

The State Technological Center of Minas Gerais (CETEC) and the São Jose dos Campos Aerospace Center were attempting to develop technology to exploit uneconomic chromite reserves located in the states of Minas Gerais and Bahia. In late 1979 it was reported CETEC had located a new chromite deposit near Serro, Minas Gerais. Available geological data suggest up to 1 million tons of contained metal is present in the region.

Columbium.—During 1978 and 1979 the amount of surplus pyrochlore available for export represented about 11% of domestic production compared with the 20% surplus in 1977 and the 60% surplus in 1967. The decline in the share available for export resulted from Brazil's increased output of ferrocolumbium alloy. Production and exports of ferrocolumbium set new records in 1978 and 1979. Exports of ferrocolumbium earned $67 million in 1978 compared with $42 million in 1977.

The Brazilian Niobium Institute was established in 1979 at Lorena, São Paulo State. Supported by the Government, the Institute was to develop technology that would expand use of columbium from Brazil's extensive deposits.

Companhia Brasileira de Metalurgia e Mineração (CBMM) embarked on a major expansion program calling for a total investment of $44 million at its Araxá complex in Minas Gerais State. Annual capacity for treating pyrochlore ore was to be increased by the second quarter of 1981 to 55 million pounds of Cb_2O_5 by construction of a new mill and flotation plant. The present 32-million-pound-per-year plant would then be placed on standby. Metallurgical facilities for converting increased concentrate output to ferrocolumbium were to be expanded accordingly. In addition, columbium oxide was to be produced beginning in 1980 at a new installation having an initial annual capacity for oxide of 3 million pounds.

By the end of 1978 measured reserves of pyrochlore increased substantially to 270 million tons of ore with an average grade of 1.84% of Cb_2O_5. The new reserves at Tapira in Minas Gerais added 126 million tons of ore to the total.

Copper.—Brazil produced only secondary copper from scrap in 1978 and 1979 and continued to rely heavily on imports to meet its demand for copper. Imports of copper in 1979 were about 195,000 tons at a cost of $360 million, reflecting higher world copper prices. Brazil's dependency on foreign sources was expected to be alleviated by the mine, smelter, and refinery project of Caraiba Metais S/A, scheduled for startup in late 1981, the Camaqua mine, and the refinery project of Eluma S/A, for 1982. It is projected that capacity to produce primary and secondary copper would increase up to 465,000 tons by 1987, at which time Brazil's foreign dependency would be reduced to 26%.

The Caraiba open pit and underground mine project nearing completion is located at Fazenda Caraiba in the municipality of Jaguarari some 400 kilometers north of Salvador, Bahia. The mine was designed to produce 180,000 tons per year of copper concentrate with an initial capacity of 50,000 tons per year at startup in late 1981. The smelter-refinery under construction in the industrial complex of Camaçari near Bahia will have a maximum capacity of 150,000 tons per year of electrolytic copper with an initial capacity of 100,000 tons per year. Initially, the smelter will receive 50,000 tons per year of concentrate from the Caraiba open pit, 12,000 from Camaqua, and 8,000 from the Pedra Verde mine (Ceará State) of Minera Sul Vicosa S/A, and the balance of copper concentrate required will be imported.

General engineering for the large $783 million Caraiba project was being supplied by Milder Kaiser Engenharia S/A, a joint venture of Kaiser Engineers of the United States and a Brazilian firm.

Rio Doce Geologia e Mineração S/A (DOCEGEO), the geological exploration unit of CVRD, reported discovery of an important copper deposit near CVRD's large unexploited iron ore deposit at Carajás in the State of Pará. Information available as of yearend 1979 indicated the existence of ore bodies containing more than 1 billion tons of ore with an approximate average content of 1.0% copper and 0.4% grams of associated gold per ton. In its annual report covering 1978, DNPM reported a 180% increase in measured reserves of copper, which includes the Jaguarai deposit in Bahia and the Viçosa deposit in Ceará.

Iron Ore.—In 1979 Brazil's total installed capacity for producing beneficiated iron ore amounted to 136 million tons or 70% of Latin America's capacity. This capacity may increase to 200 million tons per year by 1985.[5] In 1978 Brazil replaced Australia as the second world producer of iron ore after the Soviet Union. CVRD maintained its position as the world's largest iron ore mining company and the largest exporter of iron ore. CVRD's iron ore output was 51.4 million tons in 1978 of itabirite and hematite and 52.9 million tons in 1979. Brazil's second largest producer, Mineração Brasileiras Reunidas S/A (MBR), shipped iron ore at a record rate of 13.4 million tons for 1978. For 1979, shipments were expected to increase further to 15.1 million tons, mostly from its Aguas Claras mine. MBR's various expansion plans were expected to lift its output to 20 million tons per year after completion.

The next important mining companies in Brazil's iron ore quadrangle, Ferteco Mineraçao S/A and S/A Mineraçao da Trindade-Samitri, produced 6.5 million tons and 4.9 million tons, respectively, in 1978. Brazil's second largest steel mill, Cia. Siderurgica Nacional (CSN), produced 2.1 million tons of iron ore in 1978. Samarco Mineraçao S/A, a joint venture of Samitri and Utah International Co., that began operating the slurry pipeline and Ponta Ubu port in 1977, produced 3.7 million tons in 1978, below its 5-million-ton capacity.

Amazonia Mineraçao S/A, a subsidiary of CVRD, made modest progress in 1978-79 in exploiting the Carajás iron ore deposit in the Amazon Basin in the State of Pará. However, in late 1979, the Government stated that the Carajás project still had priority. CVRD was preparing a special report to the Government in order to obtain the approval of the Carajás project by the Economic Development Council. A scaled-down plan was designed for a facility estimated to cost $2 billion. This cost includes a $1 billion railroad of 890 kilometers linking the deposit to the projected port complex Itaqui in Maranhao State. By the end of 1978, 80 kilometers of the railroad were completed, and an additional 200 kilometers were planned for completion in 1980. Initial exports of ore were expected to start in 1984 at a level of 15 million tons per year.

In early 1978, Minas de Serra Geral S/A, a joint venture of CVRD and an eight-member Japanese consortium led by Kawasaki Steel Corp., decided to pursue development of the Capanema iron ore mine near Ouro Preto in Minas Gerais. The $160 million project is designed to produce 10.5 million tons of ore beginning late in 1981. The project was approved by GEIMI-Grupo Ejecutivo de la Industria Minera in Brazil.

As detailed below, three new pellet plants came onstream in 1978-1979, giving Brazil a total of eight plants with a combined capacity of 24.5 million tons of iron ore pellets per year. This represented 18% of the country's ore capacity.

Pellet plant	Start-up date	Million tons of pellets per year
CVRD I	1969	2.0
CVRD II	1973	3.0
Itabrasco	1976	3.0
Ferteco	1977	2.5
Samarco	1977	5.0
Nibrasco I	1978	3.0
Nibrasco II	1978	3.0
Hispanobras	1979	3.0
Total		24.5

In 1978, exports of pellets by Brazil increased fourfold over the 1977 level to 9.7 million tons. In 1978 Brazil was Latin America's major producer of iron ore pellets. World consumption of pellets by the steel industry has increased from 16% of the iron consumed in the West and Japan in 1967 to 26% projected for 1980.

Brazil exported about 75.4 million tons of iron ore in 1979, an 18% increase over that of 1978, at a value of about $1.3 billion. Exports of iron ore and pellets by CVRD in 1979 were valued at $754 million, 20% higher than the foreign sales of 1978. Ore shipments were mostly from the port of Tubarão followed in volume by the ports of Sepetiba and Ponta Ubu. Exports in 1978 were to Japan - 34%, Federal Republic of Germany - 22%, and France - 8%.

Domestic consumption of iron ore by Brazil's expanding steel industry grew to 12.8 million tons in 1978 and to 14.5 million tons in 1979, of which 2.15 million tons were in pellet form.

DNPM reported a 40% increase in Brazil's measured reserves of iron ore to 13.9 billion tons, with total reserves at 34.2 billion tons.

Iron and Steel.—The steel industry of Brazil continued its leading position in Latin America, accounting for 50% of the region's steel output. As a result of an ambitious steel expansion program, Brazil has moved from 20th place to 12th place among the world's steel producers. Brazil has also become a significant world producer of a large variety of ferroalloys ranking 9th after the Federal Republic of Germany.

In 1978-79 output of crude steel continued the strong growth trend of the decade, increasing 8.4% in 1978 and 14.8% in 1979. The almost 14 million tons of crude steel produced in 1979 compares with the 5 million tons in 1969. Brazil's internal demand for steel has also grown at a high rate. Total apparent steel consumption for 1979 was estimated at 13.6 million tons. In 1979, for the first time in the country's industrial history, Brazil achieved a sizable surplus of steel for export. The 1978 yearbook of the Brazilian Steel Institute listed 43 iron and steel companies in operation.

Brazil's leading steel companies, public and privately held, were engaged in expansion projects as detailed in table 4. For the first time, COSIGUA became one of the six steel companies producing more than one-half million tons of crude steel. Aços de Minas Gerais (ACOMINAS), established in early 1976 at Ouro Branco, Minas Gerais, was nearing completion of its $3 billion plant to produce 2 million tons per year of non-flat steel products. Ownership of ACOMINAS is as follows: the State of Minas Gerais - 20%, the Government-owned USIMINAS steel company - 40%, CVRD - 20%, and foreign (largely English) equipment suppliers - 20%.

Table 4.—Brazil: Major producers of crude steel

(Thousand metric tons)

Company/headquarters	1976	1977	1978	1979	Project status
Usinas Siderúrgicas de Minas Gerais S/A - USIMINAS Belo Horizonte - MG	2,345	2,721	2,709	3,100	Current capacity 3.5 million tons per year. Inaugurated Stage III expansion in August 1978. Received approval for initiation of Stage IV to increase capacity to 5.5 million tons for 1983/85.
Companhia Siderúrgica Nacional - CSN Rio De Janeiro - RJ	1,366	1,962	2,135	2,347	Engaged in $3 billion Stage III expansion program to increase capacity from 2.5 to 4.6 million tons per year by 1983. CSN's projected Stage IV would lift capacity to 6.8 million tons.

Table 4.—Brazil: Major producers of crude steel —Continued

(Thousand metric tons)

Company/headquarters	1976	1977	1978	1979	Project status
Companhia Siderúrgica Paulista - COSIPA Rio de Janeiro - RJ	789	1,539	2,029	2,500	Engaged in $1.5 billion Stage III expansion to increase capacity from 2.5 to 3.5 million tons per year scheduled for 1982. COSIPA's two blast furnaces scheduled to be rebuilt during 1980/81. Experimenting with alcohol as reductant in blast furnaces.
Companhia Siderúrgica Belgo - Mineira Belo Horizonte - MG	793	800	835	840	Engaged in construction of new blast furnace at Monlevade plant by consortium of Pohlig - Heckel - Techint. Startup is scheduled in early 1981.
Companhia Siderúrgica Mannesmann Belo Horizonte - MG	564	601	608	NA	With current capacity at 60,000 tons per year, was planning to increase capacity for laminated products to 1.4 million tons and 200,000 tons of tubes by mid-1980.
Companhia Siderúrgica da 341 Guanabara COSIGUA Rio de Janeiro - RJ	341	422	505	700	Engaged in expansion from 545,000 to 875,000 tons per year by early 1980. COSIGUA also operated Purofer (fuel oil fired) direct-reduction plant.

The Government decided in late 1979 to begin Stage IV of the steel expansion program in USIMINAS, the country's leading producer. The Cia Aços Especiais Itabira (ACESITA) was Brazil's largest specialty steel company and responsible for the control of imports and marketing of stainless steel within Brazil. ACESITA's expansion plans call for increasing special steel output from 320,000 to 600,000 tons per year estimated to cost $600 million. Usina Siderúrgica da Bahia S/A (USIBA), Aços Finos Piratini S/A and COSIGUA operated Brazil's three direct-reduction steelmaking facilities. USIBA, which operated a HyL (Mexican designed) unit, experienced uncertainties over supplies of natural gas and prices. Brazil produced 268,400 tons of sponge iron in 1978 and 327,800 tons in 1979 and was Latin America's fourth most important producer after Mexico, Venezuela, and Argentina.

The Tubarão steel project to be located in the State of Espírito Santo near Brazil's major iron ore pelletization plants, suffered delays because of funding problems and changes in product scope. It appeared that the $2.7 billion project would remain as originally designed to produce semifinished slab steel and not be redesigned to become a fully integrated plant, capable of producing a variety of finished steel products.

Startup for the 3-million-ton-per-year plant was revised from 1980 to 1982. The Tubarão project is a joint venture of CVRD, Finsider of Italy, and 14 Japanese companies led by Kawasaki.

Ferroalloys.—The impressive growth in Brazil's diversified output of ferroalloys continued in 1978-1979. The largest increases in 1979 relative to 1978 occurred in ferrovanadium +87%, ferrotitanium +82%, ferrosilicochrome +54%, ferrosilicomanganese +45%, ferrocolumbium +36%, and ferrochromium +36%. Output decreased in ferromolybdenum and ferrosilicon. Consumption of ferroalloys by Brazil's expanding steel industry totaled 197,400 tons in 1978 and 221,000 tons in 1979, an increase of 12%.

As shown in the table below in metric tons there has been a high rate of growth of exports of ferroalloys, expecially since 1975. The value of such exports in 1979 amounted to $168 million compared with $78 million in 1976.

Year	Production	Exports	Imports
1971	127,048	20,881	23,023
1972	139,797	45,438	6,055
1973	179,011	45,987	7,405
1974	227,917	53,256	12,851
1975	256,497	58,650	7,201
1976	311,903	87,254	3,801
1977	371,251	113,576	16,482
1978	409,547	150,365	2,981
1979	475,461	172,113	NA

Manganese.—Brazil continued as one of the major world producers and exporters of manganese ore. Industria e Comercio de Minerios S/A (ICOMI), Brazil's largest producer, shipped 1,189,800 tons of manganese ore and pellets in 1979 compared with 783,300 tons in 1978. Destinations of ICOMI shipments in 1979 were as follows: Europe - 68%, Asia - 15%, North America - 15%, and South America - 2%. For 1979 ICOMI planned to invest $3 million for expansion of its manganese ore reserves with emphasis on redimensioning work at its major Serra do Navio deposits in central Amapá in the Amazon Basin, and in prospecting in the State of Mato Grosso.

Construction of a new iron and manganese mine by Mineração Corumbaense Reunida Ltda. was scheduled for completion in 1979 at Corumbá, Mato Grosso, near the Bolivian border. Annual output was expected to be 3 million tons of iron ore with an iron content of 50% to 68% and 500,000 tons of manganese ore with a metal content averaging 46%. Iron ore will be shipped from the company's own port facilities at Porto Esperança for export while manganese ore will be for domestic markets. Company ownership is divided between Brazilian and Argentine interests.

Reflecting the high rate of growth of the country's steel industry, consumption of manganese ore increased 30% to 240,000 tons. Output of ferromanganese and ferrosilicomanganese totaled 261,000 tons in 1979, a 16% increase.

Seven countries - Brazil, India, Gabon, Ghana, Upper Volta, Morocco, and Zaire (meeting in Libreville, Gabon) - declared interest in an international agreement on manganese to guarantee fair prices and to stabilize the market.

Nickel.—In 1979 the International Finance Corp. (IFC) of the World Bank Group approved financing of almost $63 million for the nickel mine and smelter project of Empresa de Desenvolvimento de Recursos Minerais "CODEMIN" S/A near Niquelandia in the State of Goiás. The project, estimated to cost almost $100 million to produce 5,000 tons per year of nickel in the form of ferronickel for sale in the domestic market, was scheduled for startup in late 1981 and full production in 1982. CODEMIN is an associated company of Brasimet, the operator of the Morro do Niquel mine at Pratapolis, Minas Gerais. Brasimet in turn is owned by Brazilian interests and the Hochschild Group. The Hochschild Group is the main sponsor of the project with 55% of the capital shares and will be responsible for the management of CODEMIN and provide the company with experienced personnel from its current mining operations in Brazil.

Also in 1979 Brazil became self-sufficient in electrolytic nickel. In the past Brazil has been essentially a producer of ferronickel for the domestic market with only small amounts available for export. Early in 1979, Companhia Niquel Tocantins (CNT), a subsidiary of the Brazilian-owned Votorantim group, initiated operation of its new electrolytic nickel plant at São Miquel Paulista in the State of São Paulo. Initial capacity of 5,000 tons per year of high-purity nickel was expected to increase to 10,000 tons per year in 1981. CNT also initiated a plant to produce basic nickel carbonate at Niquelandia, Goiás, with a capacity of 10,000 tons per year increasing to 20,000 tons per year in 1981.

The Ministry of Mines and Energy projected that, considering the new projects, Brazil would be self-sufficient in total nickel requirements (both ferronickel and electrolytic nickel) until 1982 and then become increasingly dependent on foreign sources. The overall nickel deficit in 1987 would be 44%. Electrolytic nickel alone was expected to be in surplus and available for export until 1987. On the other hand, the deficit in ferronickel was expected to increase from 1979 until 1987 when Brazil's demand would grow to 20,500 tons and supply would be only 7,300 in terms of nickel content. In 1978 the supply and demand of ferronickel were in balance. There were no exports of ferronickel in 1978 compared with the 3,838 tons exported in 1975.

Tin.—Tin production in 1978 and 1979 continued its steady rise since the depressed level of 1971. The Government was attempting to make Brazil a factor in the world tin market. Through CVRD, it was planning to pool the activities of small privately owned tin mining units operating in Roraima, Pará, and Goiás, and then centralize research and development costs, planning, and marketing. CVRD will reevaluate Brazil's tin reserves.

The Minister of Mines and Energy authorized a study of the ramifications of a reopening of the Rondonia tin district, the main producing area with the only significant mechanized operations, to "garimpeiros" (individual prospectors). About 4,000 ex-garimpeiros were reported to be unemployed and pressuring to return to the tin district.

Companhia Estanífera do Brasil (CESBRA), a Patino Group subsidiary, purchased Philipp Brothers' 50% equity in Minera Brasiliense S/A (MIBRASA) for $5 million. MIBRASA operates a washing plant at Santa Barbara and a dredge at Candeias that produces about 100 tons of tin concentrate per month. CESBRA operates the largest tin smelter in Brazil at Volta Redonda. The first bucket-wheel suction dredge to be used for mining purposes in Brazil was purchased for the Igarape Preto Mine in 1978 and began operations the following year.

In 1979 Brazil's steel industry consumed 2,241 tons of tin—a 12% increase over that of 1978—representing about 25% of national output. Exports of refined tin were valued at $22 million in 1978 while imports of tin concentrate primarily from Bolivia cost $26 million.

Titanium.—DNPM of the Ministry of Mines and Energy reported in 1978 a sharp increase of 430% in the measured reserves of titanium in the form of anatase, an alteration product of titanium minerals, which has not been discovered in commercial quantities elsewhere. The 303 million tons of ore reported are located primarily in the State of Minas Gerais in the municipality of Tapira (200 million tons) and Patrocinio (75 million tons).

Mineraçao Vale do Paranaiba S/A (VALEP), a phosphate producing subsidiary of CVRD, was developing the Tapira deposits, which consist of anatase in association with phosphate, columbium, and rare-earth minerals. The major product of VALEP's operations will be phosphate. VALEP was reportedly considering construction near the ore deposits of a $100 million first-stage plant to produce 60,000 tons per year of titanium dioxide pigment.

Titanio do Brasil S/A (TIBRAS), Brazil's only titanium pigment producer, announced plans to double production at its Bahia plant to 50,000 tons per year of pigment by 1982, which would meet Brazil's domestic demand estimated at 50,000 tons per year. Currently the country must import about 28,000 tons of pigments. In 1978 imports of the titanium mineral ilmenite, all from Australia, amounted to about 56,000 tons.

Uranium.—(Refer to Mineral Fuels)

NONMETALS

In its report covering 1978, DNPM reported substantial increases in the reserves of several nonmetallic ores: kyanite-270%, agalmatolite-148%, lithium (amblygonite)-133%, barite-114%, feldspar-55%, diatomite-50%, calcite-45%, talc-35%, and graphite-35%.

Barite.—Imco Services began producing from its processing facility in Araxá, Minas Gerais, utilizing a byproduct barite from Companhia Brasileria de Metalurgia e Mineração-CBMM, a ferrocolumbium producer.

Cement.—Brazilian cement plant programs remained active and conversion from costly fuel oil to low-quality coal challenged the industry. During 1978 there were 54 cement plants onstream and six clinker grinding stations, including the two at Itaipú Dam under construction. Gross capacity in 1978 was 24.7 million tons per year, up from 21.6 million tons in 1977 and the Sindicato Nacional da Industria do Cimento (SNIC) forecasted a capacity of 25.6 million tons per year in 1979 and 27.1 million tons in 1980. Domestic consumption of cement in 1980 was expected to rise to 28.8 million tons, requiring imports of 1.7 million tons.

Lone Star Industries Inc. and La Farge S.A., leading cement industries in the United States and France, respectively, entered into an agreement to combine their cement operations in Brazil and construct a 700,000-ton-per-year plant at Cantagalo northeast of Rio de Janeiro. The $125 million plant will be operated by Cimento Maua S/A, controlled by Companhia Nacional de Cimento Portland owned 52% by Lafarge and 48% by Lone Star.

Fertilizer Materials.—Although Brazil has embarked on an ambitious program to increase its capacity to produce phosphate rock and potash from domestic sources, it remained very dependent on foreign supplies. In 1978, imports of phosphatic, nitrogenous, and potassic fertilizers required $370 million in foreign exchange. It has been estimated by DNPM that Brazil's deficit position in production of phosphate rock will continue to decrease until 1983, but imports will remain a necessity. Domestic demand is projected to grow to 1.8 million tons of P_2O_5 in 1983 while domestic supply will expand to 1.5 million tons.

During 1978-79 Brazil increased the number of phosphate rock producers and greatly augmented the country's productive capacity. According to the Institito Brasileiro do Fosfato (IBRAFOS), five companies in 1978 had an installed capacity of 392,000 tons per year of P_2O_5, while in 1979 seven companies had an installed capacity of 790,000 tons. Quimbrasil-Quimica Industrial Brasileira S/A was producing 350,000 tons per year of 36% P_2O_5 concentrate at its phosphate mine in Cajati, São Paulo State. Quimbrasil was also the principal partner in a joint venture with CVRD for producing 600,000 tons per year of 37% P_2O_5 concentrate at the mine in Araxá, Minas Gerais. VALEP a subsidiary of CVRD (refer to item under titanium) completed its project to produce phosphate rock in October 1978 and by 1979 had an installed capacity of about 200,000 tons of P_2O_5 compared with the planned capacity of 900,000 tons of P_2O_5 per year.

Petrobrás Mineração S/A (PETROMIN) was moving forward on schedule to develop the potash deposits at Carmópolis in Sergipe State. Technical assistance was being provided by the Compagnie des Mines et Potasse d' Alsace. The $150 million project was designed to produce 500,000 tons of potassium chloride with startup in 1982.

In its report for 1978, DNPM reported 1 billion tons of phosphate rock reserves with a P_2O_5 content of 96 million tons on the basis of an average grade of 9.5% P_2O_5.

Fluorspar.—Brazil was the second most important producer of fluorspar in Latin America after Mexico; Brazil and Argentina were the principal producers in South America. The chief Brazilian producer was privately owned Mineração Santa Catarina Ltda. (Votorantim group) with a capacity of up to 40,000 tons per year of acid spar in a plant located in the Morro da Fumaça area of Santa Catarina State.

The largest measured ore reserves are in the municipalities of Morro de Fumaça and Pedras Grandes in Santa Catarina. Ore grade ranges between 35% and 88% CaF_2. DNPM reported 1.3 million tons of measured ore reserves in 1978 with a weighted average grade of 57% CaF_2.

MINERAL FUELS

Coal.—The output of coal increased substantially as efforts increased to make better use of Brazil's coal resources. Preliminary data give the following breakdown for production of marketable coal in three main producing States in southern Brazil: Santa Catarina-3,200,000 tons, Rio Grande do Sul-2,300,000, and Parana-300,000 tons. Private coal companies accounted for about two-thirds of the production in Santa Catarina and less than one-half of production in Rio Grande do Sul.

Consumption of coal in 1978 from domestic sources amounted to about 4.0 million tons, primarily for powerplants (2.5 million tons), the steel industry (973,000 tons), and the cement industry (150,000 tons). Total consumption of metallurgical coal by the steel industry in 1979 from domestic and foreign sources increased 22% to 5.17 million tons, of which 76% came from foreign sources. Coke and charcoal consumed in 1979 for steelmaking was 4.2 and 7.4 million tons, respectively. Brazil imported 4.5 million tons of coal in 1979 compared with 3.7 million tons imported in 1978.

Plans were being made by Rio Grande do Sul and Santa Catarina to quintuple coal production by 1985 under a National Coal Promotion plan governed by second priority below alcohol. On the demand side, plans call for substitution of most industrial uses of fuel oil with coal or synthetic gas also by 1985. The projected output from Rio Grande do Sul, which has 75% of Brazil's measured reserves, is 10.6 million tons of coal. Because of the high ash content of this coal, this amount of steam coal would have to be doubled to obtain the run-of-the-mine output. On this basis, the coal mine output from Rio Grande do Sul is projected at 4.3 million in 1980, about 11 million in 1982 and 23 million in 1985. Production is to be divided among the mines of the State-owned company Cia Riograndense de Mineraçao (CRM) and those of privately owned Cia de Pesquisas e Lavras Minerais (COPELMI). The 1985 output is planned to be utilized as follows: cement industry-32%, gasification plants-25%, thermal powerplants-21%, petrochemical and paper-7%, and other industries-15%.

The energy development plan of Santa Catarina also emphasizes expanded coal production but a larger relative importance is given to alcohol and to solar and wind energy. Santa Catarina's coal plans call for a production of 9.7 million tons by 1985. This target is to be achieved by operating 13 new mines: Five in the Camada Barro Bronco coal seam (with metallurgical and steam coal) and eight in the Camada Bonito seam having only steam coal.

The three southern coal States mentioned above were also planning a common coal gasification strategy based on a two-step approach: high-Btu gasification plants located at coal mine sites to supply remote industrial centers in the Center-South through gas pipelines and a system of small low to medium-Btu gasification plants to supply local energy needs.

In early 1979, PETROBRAS contracted Krupp-Koppers GmbH of Essen, Federal Republic of Germany, to design and build a coal gasification plant at São Jerônimo in Rio Grande do Sul. The $200 million plant will convert bituminous coal with a high ash and sulfur content into gas using the Koppers-Totzek process. Coal for the plant will come from CRM's Leão II mine under development which in 1985 is expected to produce 2.4 million tons. An important feature of coal from the Leão mine is its high reactivity, a fundamental factor in gasification. PETROBRAS and Cia. Siderúrgica de Santa Catarina-SIDERSUL were engaged in joint studies for a gasification plant in Santa Catarina to produce gas for SIDERSUL's proposed sponge iron plant.

The National Coal Program also calls for increased effort to more accurately define Brazil's coal reserves. Over the past 10 years, estimated coal reserves have increased from 2 billion to 22 billion tons. The major part of the reserves is suitable for underground mining. Increased drilling is programed for the Morungava coalfield, the most promising new field, and for Leão/Butia field all in Rio Grande do Sul. Brazil is considered to have the second largest coal reserves in Latin America after Colombia.[6]

Natural Gas.—The major part of natural gas produced (86%) was in association with the production of crude petroleum. Onshore oilfields accounted for 61% of the natural gas produced. Progress was made in programs to increase the capacity of the industrial sector to utilize the natural gas produced. In 1979, 223 kilometers of new gas pipelines were placed in operaton in the Northeast. Following a 16% increase in 1977, at yearend 1978, reserves of natural gas increased again by almost 13%. By yearend 1979 gas reserves increased by only 2% to 1.6 trillion cubic feet.

In October 1978, Brazil and Bolivia signed a letter of intent covering future gas sales to the industrial areas of São Paulo, via a planned 640-kilometer gas pipeline from Santa Cruz, Bolivia, to supply 400 million cubic feet per day. The amount of gas reserves needed to implement the final contract will be determined with loans from the World Bank and the Inter-American Development Bank. Bolivia's largest gas reserves are located north and northwest of Santa Cruz, an area being held in reserve to supply the planned gasline to Brazil. At the end of 1978, Bolivia's proved reserves of natural gas were estimated at 5.99 trillion cubic feet. The proposed international gas pipeline is estimated to cost $1.2 billion.

Oil Shale.—In 1979 PETROBRAS received presidential authorization to construct the first stage of a commercial oil shale plant at São Mateus do Sul in Paraná State. The basic engineering plan for the $1.5 billion plant was expected to be completed in early 1980. The National Oil Council moved the startup date forward to 1984. The plant will use the Petrosix process patented by PETROBRAS and will be operated in two phases. Initially it will produce 22,800 barrels per day of fuel oil and 450 tons per day of sulfur. In the second phase 112,000 tons per day of oil shale will be processed to extract 51,000 barrels per day of crude synthetic oil.

Petroleum.—The downtrend in the production of crude petroleum since the peak year of 1974 was reversed slightly in 1979 but provided for just 15% of Brazil's requirements. Performance of the offshore oilfields on the continental shelf compensated for the depletion of the mature onshore producing fields. The offshore oilfields offered the best possibilities for Brazil to increase its oil production. Intense development work in the offshore areas is indicated by the fact that oil production from offshore areas increased by 31% in 1979 relative to 1978. Oil produced in 1979 came from 61 onshore fields and 13 offshore fields.

Table 5 shows the breakdown in crude oil production according to the major producing area. The average output during the first semester of 1979 of 159,300 barrels per day increased to an average of 171,700 barrels per day in the second semester. The increase in offshore oil output in 1978 came especially from the Ubarana oilfield in Rio Grande do Norte and from Cacao in Espírito Santo. The sizable increase in offshore output in 1979 was due to the startup in operations of the Agulha oilfield in Rio Grande do Norte, Robalo in Sergipe and Enchova-Leste, Garoupa and Namorado in Rio de Janeiro.

Table 5.—Brazil: Crude oil production by PETROBRAS

(Thousand 42-gallon barrels)

Area	1979 Production	1979 Share (percent)
Bahia	21,104	51.5
Sergipe	16,511	27.3
Rio de Janeiro	5,850	9.7
Rio Grande do Norte	3,761	6.2
Espírito Santo	2,132	3.5
Alagoas	1,076	1.8
Total	60,434	100.0
Onshore	39,671	65.6
Offshore	20,763	34.4

Source: Annual Report of PETROBRAS, 1979.

Secondary recovery projects underway by PETROBRAS in 1978 covered 19 oilfields, 16 in Bahia and 3 in Sergipe. The mature oilfields were submitted to injections of gas and/or water. The Carmópolis steam injection project was started in April 1978 and the in situ combustion project, also in Carmópolis, was started in 1979.

The changes in Brazil's consumption in the major petroleum products is shown in the tabulation below in percent.

Year	Motor gasoline	Diesel oil	Fuel oil	All products
1977	-3.8	+6.7	+2.2	+2.1
1978	+7.6	+8.1	+10.9	+8.5
1979	+3.5	+9.7	+4.1	+6.5

Alcohol mixed with motor gasoline represented almost 10% of gasoline consumed in 1978 or almost 9 million barrels of alcohol compared with 4 million barrels added to gasoline in 1977. In 1979 the National Petroleum Council increased product prices 61% or 9% in real terms.

The cost of importing crude oil and naphtha was $4.09 billion in 1978, increasing to $6.26 billion in 1979 at a cost per barrel of $12.44 and $17.11, respectively. In 1979 the volume of these imports increased 11% to 366 million barrels. Oil imports in 1978 were mostly from Saudi Arabia-33%, Iraq-30%, and Iran-13%.

Investments by PETROBRAS in the oil industry in 1978 increased 41% to $1.8 billion of which 47% was devoted to exploration and production. This share was 55% in 1979, thus emphasizing the company's policy of concentrating investments in this sector. In 1978-79 exploration activity was substantially intensified particularly in the sedimentary basins of the upper Amazon, Maranhâo, Barreirinhas, Alagoas, Reconcavo, Paraná, and on the continental shelf of Foz do Amazonas, Pará-Maranhâo, Piaui-Ceará, Potiguar, Bahia-Sul, Espírito Santo, Campos and Santos. By yearend 1979 Brazil's reserves of crude petroleum including natural gas liquids increased 10.6% to 1.26 billion barrels.

During 1978, nine additional service contracts with a risk clause were signed with petroleum companies bringing to 17 the total signed since inception of the program. Total investment commitments for exploration were $212 million. The third international auction for exploration areas began in October 1978. In 1979 11 additional service contracts were signed and the fourth international auction began in September.

In August 1979, PETROBRAS granted onshore exploration rights for the first time when it signed an agreement with affiliates of Royal Dutch/Shell to explore the middle Amazon region southwest of Manaus.

Alcohol Program.—PETROBRAS continued its research on the use of methyl and ethyl alcohol as an additive to motor gasoline. At its Curvelo Alcohol Plant in Minas Gerais, PETROBRAS seeks to demonstrate the feasibility of equipment and processes to check the quality of manioc obtained in the region. It was proposed to increase the level of alcohol in the gasohol blend from 20% to 25%. The National Alcohol Commission of Brazil gave permission in 1979 to export up to 500 million liters of alcohol produced from the 1979-80 harvest. Alcohol would be sold at about $50 per barrel.

Uranium-Nuclear Energy.—In December 1979 the Minister of Mines and Energy announced an increase in Brazil's total reserves of uranium officially estimated at 215,000 tons of U_3O_8, up 51% from the 142,000 tons reported by DNPM for 1978. Details on the location of the deposits were provided by Empresas Nucleares Brasileiras S/A (NUCLEBRAS) as follows:

Municipality/State	Measured/Indicated	Inferred	Total
Itatiaia - Ceará	83,000	39,500	122,500
Poços de Caldas - Minas Gerais	20,000	6,800	26,800
Figueira - Paraná	7,000	1,000	8,000
Quadrilatero Ferrifiro - Minas Gerais	5,000	10,000	15,000
Espinhares - Paraiba	5,000	5,000	10,000
Logoa Real - Bahia	3,500	23,500	27,000
Amoriópolis - Goiás	2,000	3,000	5,000
Campos Belos - Goiás	500	500	1,000
Total	126,000	89,300	215,300

The deposit at Espinhares was discovered by NUCLAN, a joint prospecting effort of NUCLEBRAS and Urangesellshaft. There appeared to be enough resources of uranium discovered to meet the projected future fuel needs of Brazil's Nuclear Power Reactor Program.

The Mineral Industry of Bulgaria

By Tatiana Karpinsky[1]

In 1978 and 1979, the most important mineral commodities of Bulgaria were iron and steel, lead, zinc, copper, coal, crude oil, natural gas, fertilizers, cement, fluorspar, gypsum, kaolin, and certain rare elements. According to official Bulgarian sources, the country was self-sufficient in electrolytic copper, lead, and zinc, but remained deficient in crude oil, natural gas, iron ore, phosphates, and some other minerals and ores. In 1979, Bulgaria produced more than 70% of its needs in rolled steel and more than 90% of its needs in nonferrous metals and alloys. The ferrous and nonferrous metals industry, including mining, provided some 6% of Bulgaria's industrial production. In 1978, industry accounted for 55% of the national income.[2] Reportedly, the national income in 1978 increased 6%, compared with that of 1977, and reached L16,337 million.[3] In 1979, national income increased 6.5% over that of 1978.[4]

The value of Bulgaria's industrial production was reported to have increased 7% in 1978 and 7.8% in 1979, compared with that of the previous years. Labor productivity increased more than 6% each year. Capital investment in the economy totaled L5.4 billion in 1978[5] and about L6.0 billion in 1979. The production plan of the Ministry of Metallurgy and Mineral Resources for 1978 and 1979 was not fulfilled; however, total production of the Ministry increased 4.1% in 1978 and 3.7% in 1979.[6]

Major projects put into operation in 1978 included the Varna-Ilichevsk main ferryboat line, the first section of the Maritsa-East 3 electric powerplant, and the cement plant in Devnya. In 1979, the following projects were completed: The cast iron plant in Ikhtiman, the Belmeken-Obedinen coal mine, the fourth and fifth electric filters of the Zlatna Panega cement plant, and a few others.

Bulgaria's chief industrial problems continued to be labor shortages, unused production capacity in certain sectors, poor management, and poor quality of production. As a measure aimed at improving the general system for production specialization and the management structure of the Ministry of Metallurgy and Mineral Resources, the Ministry was planning to abolish the Ferrous Metallurgy DSO (State Economic Trust), the Nonferrous Metallurgy DSO, the Inert Mineral Raw Materials DSO, and a few others. Also, the following economic organizations, technical divisions, and other establishments were scheduled to be formed directly under the Ministry of Metallurgy and Mineral Resources, effective June 1, 1979:

1) The Geology Committee in Sofia;

2) The Kreminikovtsi Metallurgical Combine in Botunets;

3) The Lenin Metallurgical Combine in Pernik;

4) The Enterprise for Steel Wire and Rod in Roman, Vratsa Okrug;

5) The Metallurgical Combine in Srednogorie, Sofia Region;

6) The Gorubso Mining Metallurgical Combine in Madan;

7) The D. Ganev Combine for the Processing of Nonferrous Metals in Sofia;

8) The Combine for Aluminum Processing in Shumen;

9) The Osogovo Mining-Dressing Enterprise in Kyustendil Okrug;

10) The Rare Metals State Trust; and a few others.

The total number of industrial workers and employees in state enterprises was 1,230,716 in 1978. The number of workers and employees in state mineral and energy enterprises, by branches, for 1978, is given in the table below.[7]

State enterprises	Workers and employees (thousands)
Fuel industry	50.8
Ferrous metallurgy (including ore mining)	32.2
Engineering and metal working industry	350.0
Production of electricity and steam heat	22.5

Bulgaria continued to participate in many multilateral investment projects on Soviet territory for the production of natural gas, petroleum, asbestos, iron ore, and other products in 1978 and 1979. Under a mutual agreement, Bulgaria is to be repaid 10 to 12 years after these projects are completed, through Soviet exports of the following products (annually): asbestos, 40,000 tons; iron ore concentrate, over 1 million tons (in terms of metal); ammonium phosphates, 26,000 tons; natural gas, almost 3 billion cubic meters; and large amounts of electric energy, oil, and other products.

Bulgaria receives Soviet assistance in developing its raw material and energy resources. The U.S.S.R. was expected to help build many large enterprises for Bulgaria's coal industry, such as the Bobov Dol Obedinen, Troyanovo-North, Troyanovo-South, and Zdravets mines. The U.S.S.R. also planned to provide scientific and technical assistance for the development of a coal basin in Dobrudja and for development of Bulgaria's copper industry.

Government Policies and Programs.— On December 1, 1978, the National Assembly approved Bulgaria's economic plan for 1980. It was drawn up along the directives outlined by the 1975 Eleventh Congress of the Bulgarian Communist Party. The plan suggested that emphasis will continue to be placed on a few favored branches of the economy, such as mining and metallurgy, chemicals, heavy machine building, and energy.

The plan for 1980 was aimed mainly at raising efficiency and quality. It called for sharply reducing the number of new projects in 1980 in order to bring old ones to completion. The plan also called for increased capacities in energy, raw materials (especially lignites), atomic power, lead and zinc ore processing, copper mining, and in a number of small projects. The plan called for an 11% increase in the production of electric and thermal power in 1980, compared with that of 1979; and an increase of 9% in 1981, compared with that of 1980. Completion of the third 440-megawatt reactor at the Kozloduy Atomic Power Station was scheduled for 1980. The plan called for completion on time of the following projects in 1980: the expanded chemical plants in Burgas and Devnya, the Elatsite ore concentrator, the plant for electric steel production in the Lenin metallurgical complex, the Shumen aluminum processing complex, the Roman steel wire and cable plant, expansion of the Varna and Maritsa East 3 power stations, and other projects.

PRODUCTION

Bulgaria's 1979 plan for overall industrial output was reportedly fulfilled. However, the plan's goals were not met for the production of pig iron, steel, mineral fertilizers, coal, electric energy, and a few other commodities. In contrast to previous years, no industry in 1979 registered a production increase of more than 10%. The greatest production increase, 8.9%, was achieved by the chemical industry, although the targeted increase for that industry was 9.1%. The ferrous metallurgy and building materials industries both increased their output by 5.2%. The planned increase of 15.6% in coal production was also not met.

Development of the country's coal mining industry, which centered mainly on lignite and brown coal, continued in 1978 and 1979. About 75% of the production came from open pit mining. The Maritsa East lignite basin accounted for more than half the coal mined in 1979. Bituminous coal production was expected to increase considerably after development of the Dobrudja deposits.

In 1978 and 1979, the largest new investment project in the copper industry was the development of the Elatsita copper mine, which had a planned capacity of 10 million tons of ore per year. Development of the surface mining operation of the Assarel copper mine also began. Development of mines and modernization of production facilities in the lead-zinc industry continued, but the production of zinc increased only slightly.

In order to extend its steel industry, Bulgaria continued to renovate the Lenin and Kreminikovtsi steel complexes. An effort that was expected to make Bulgaria self-sufficient in steel production was the construction of a third complex near Burgas, which was planned to start in 1980. In 1978 and 1979, a number of U.S. firms were in contact with the Bulgarian Ministry of Metallurgy and Mineral Resources regarding the provision of equipment and technology for construction of various rolling mills at the third metallurgical complex. Electric energy generation amounted to 32.4 billion kilowatt-hours in 1979, almost 1 billion kilowatt-hours more than was generated in 1978. About 60% of the electric energy generated came from thermal electric powerplants operating on locally mined coal.

[e]Estimate. [p]Preliminary. [r]Revised.
[1]In addition to the commodities listed, bismuth, chromite, gold, palladium, platinum, tellurium, uranium, barite, fluorspar, magnesite, and a variety of crude construction materials (common clays, sand and gravel, dimension stone, and crushed stone) are produced, but available information is inadequate to make reliable estimates of output levels.
[2]Reported figure.

TRADE

The turnover of foreign trade (exports plus imports) in 1978 increased about 11%, compared with that of 1977. The value of exports was L6,650 million, reflecting an increase of about 10%; and the value of imports was L6,801 million, reflecting an increase of 12%.

In 1978, imports of machinery and equipment accounted for about 40% of the value of Bulgaria's total imports; and fuel, minerals, and metals accounted for about 39%. Exports of machinery and equipment comprised about 47% of the value of total exports in 1978; and fuel, minerals, and metals comprised only about 9%.[8]

In 1978, trade with centrally planned economy countries accounted for 80.1% of the country's total turnover. The U.S.S.R. was responsible for about 57% of the foreign trade turnover of Bulgaria. Deliveries of Soviet goods are of decisive significance for satisfying the import requirements of Bulgaria. Soviet deliveries covered over 57% of Bulgaria's import requirements for machinery and equipment, and the percentage of Bulgaria's import requirements that was supplied by the Soviets for other commodities was 98% of the imported coal and electric power, 93% of the oil, 87% of the coke, and 100% of the ingot steel. In 1979, foreign trade turnover increased by 11%, compared with that of 1978. The value of exports increased by 15%, and the value of imports increased by 7%.[9]

In 1979, imports of fuel, minerals, and metals accounted for 42% of the value of Bulgaria's total imports; but exports of the same group of commodities accounted for only about 13% of the total exports. Bulgaria did especially well in expanding exports to the developed market economy countries in 1979. Bulgaria asserted that in 1979 it achieved a positive balance of payments with the West for the first time.

Trade between Bulgaria and the developing countries in 1979 exceeded L1,133 million, compared with trade valued at L980 million in 1978. The bulk of this trade is carried out with India, Iraq, Iran, Lebanon, Jordan, Syria, and Turkey (among the Asian states); Algeria, Egypt, Libya, Morocco, and Nigeria (among the African states); and Brazil (among the Latin American states). In 1978, 11 of the above-mentioned countries accounted for 80% of Bulgaria's trade with the Third World countries. There were prospects that in the near future Angola, Mozambique, Ethiopia, Tanzania, Zambia, and more Latin American countries would also become regular trading partners with Bulgaria. Bulgaria's exports to the Third World countries consisted mostly of machines and equipment, technological lines, and complete plants; and Bulgaria imports from those countries ores, fuel, and other products.

Imports planned for 1980 from the U.S.S.R. included 13 million tons of crude oil and 2 million tons of petroleum products. About 2 million tons of crude oil were expected to be delivered to Bulgaria in 1980 by countries belonging to the Organization of Petroleum Exporting Countries (OPEC).

It was expected that Bulgaria's main interest in trade with the United States would continue to focus on the importation of technology that will enable the country to renovate its industrial base and increase production while using fewer raw materials.

In late 1979, Occidental Petroleum signed a 10-year agreement with Bulgaria covering possible projects for the design and construction of plastics, petrochemical, and fertilizer plants; for the development of coal production and liquefaction; for mineral exploitation; and for exploration for crude oil. The agreement could later result in production sharing, joint ventures, or service contracts. In March 1980, the president of Occidental visited Bulgaria to discuss implementation of the agreement.

It was expected that in 1980 Bulgaria would sign an agreement that would seek to speed up prospecting for nonferrous metals in the Santa Clara region of Cuba. Bulgaria was also planning to sign an agreement with Vietnam on cooperation up to 1980 in prospecting for bauxite, lead, and zinc ores.

Table 2.—Bulgaria: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum metal including alloys, unwrought	4,134	4,629	Japan 3,944; Yugoslavia 572.

COMMODITY REVIEW

METALS

Aluminum.—Bulgaria is an importer of aluminum metal and aluminum alloys. Construction of the Shumen aluminum processing complex, with a projected 48,000-ton annual capacity, continued in 1978 and 1979.[10] Most of the machines and equipment for the project were delivered from the U.S.S.R., and the raw materials for the new complex were also expected to come from that country. The press section of the complex began operations in 1978 and was commissioned in 1979.[11] The press section was expected to account for 30% of the complex's overall output. Completion of the entire complex was scheduled for 1980.

Copper.—Approximately 84% of Bulgaria's copper ore is surface mined. In 1978 and 1979, most of the country's copper production came from the open pit Medet with an annual capacity of 8 million tons of ore. The rest of the country's ore came from the Chelopech underground mine, the Burgas mine, and other mines. Consumption of copper in Bulgaria was entirely satisfied by domestic production. The production of electrolytic copper was planned to increase in 1980 by 50% over that of 1975. Over L400 million was expected to be invested until 1980 to renovate the Georgi Damyanov copper plant in the town of Srednogorie and to increase the production of raw materials for the plant. The increased raw materials production was planned to be achieved mainly after completion of the Elatsite ore-dressing plant. The Elatsite complex was expected to be, upon completion, the biggest facility within Bulgaria's nonferrous metallurgy industry. It was planned to include a strip mine with a projected capacity of 10 million tons of ore per year (0.45% copper content); an ore-dressing plant; and underground ore-transport facilities, including a 7-kilometer tunnel with a conveyor belt.

Under an agreement signed in 1979 between Bulgaria and Finland, Finnish Outokumpu Ahlstrom and Rauma-Repola (AOR) was to deliver and install the Outokumpu flash-smelting technology at the Georgi Damyanov copper plant in 1981 and 1982. In 1979, Bulgaria started development of copper ore mining at Assarel.[12] The Assarel mine was included as one of the major projects of the 1981-85 5-year plant. The main target for the copper industry under that 5-year plan was to achieve a further increase in copper output by developing and putting into operation the new capacity of the Elatsite, Elshitsa-2, Lebnitsa-Zone II, Assarel, and Tsar Arsen mines and a few others.

The Ore Mining and Dressing Institute in Sofia was planning to build an underground mine and dressing plant in Vietnam for the production of copper ore. Plans were for Bulgaria to supply and install the plant's machinery. Experts from the institute were also planning to build a similar plant in Algeria.[13]

Iron and Steel.—Bulgaria's output of iron ore has been insufficient to satisfy growing domestic needs, and a large amount of iron ore has been imported almost exclusively from the U.S.S.R. Also, about 80% to 85% of Bulgaria's coke imports comes from the U.S.S.R.; the rest comes from Poland and Czechoslovakia.

In 1978 and 1979, domestic iron ore was mined mainly at the Kreminikovtsi deposits north of Sofia and was delivered to the Kreminikovtsi Metallurgical Complex. Kreminikovtsi iron ore consists of limonite (70%), siderite (18%), and hematite (12%); and reserves are estimated at 250 million tons with an iron content of about 30%. Besides iron, Kreminikovtsi iron ore deposits contain barite, manganese, lead, and—in lesser quantities—copper, zinc, and rare metals. Reportedly, new technology for the recovery and use of these metals was recently developed at the Institute of Nonferrous Metallurgy.

Production of pig iron and steel in 1979 was below the 1978 level.[14] The commissioning of the belts at the agglomeration plant of the Kreminikovtsi Metallurgical Complex was delayed as a result, the planned blast furnace production capacity was not reached, and the planned quantities of pig iron and steel were not produced.[15]

In 1980, pig iron production is planned to reach 1.8 million tons; crude steel production 2.9 million tons; rolled ferrous metals 3.4 million tons; and steel pipes 248,000 tons.[16]

Two large metallurgical complexes, the Lenin Metallurgical Complex at Pernik, commissioned in 1953, and the Kreminikovtsi complex, which started operations in 1963, were under renovation in 1978 and 1979. Total production of the Lenin and Kreminikovtsi plants was expected to reach 4 million tons per year when modernization of the steel plants is completed. The 1976-80 5-year plan provided for renovation of the first agglomeration plant at the Kreminikovtsi complex,the second blast furnace, the blooming mill, and other existing facilities, and construction of a fourth coke battery and a fourth blast furnace.[17] Electric steel furnaces with a capacity of 1 million tons per year were under construction at the Lenin plant in 1978 and 1979 and were expected to be commissioned in 1981.[18]

Construction of a third metallurgical complex with a total capacity of 4 million tons of steel per year was planned to start near the Black Sea town of Burgas in 1980. Its first stage of contruction was planned to be completed in 1985. It was expected that this complex, along with the two existing metallurgical complexes, would make Bulgaria self-sufficient in ferrous metals. The ore, coke, and part of the electric power for the new complex was expected to be imported from the U.S.S.R.[19]

In 1978 and 1979, construction work was in progress at the steel plant near Rakovsky, which was expected to produce more than 50,000 tons of castings per year for use in different industries. The first stage of the plant was scheduld to be completed in 1981, and completion of the second stage was scheduled for 1983.

Lead and Zinc.—Bulgaria has an exportable surplus of lead and zinc metals. In 1978 and 1979, annual consumption of lead was approximately 105,000 tons. Bulgaria has several mining enterprises for lead-zinc production; they are Gorubso, Madjarovo, Ustreme, Dmitrov, and a few others. About 73% of all the country's lead-zinc deposits are concentrated in the Gorubso lead-zinc ore fields in the Rhodopes region, in the vicinity of Madan and Rudozem. In 1978 and 1979, Gorubso Mining Enterprises accounted for about 86% of the country's total production of lead and for more than 90% of the total production of zinc concentrates.[20] All Bulgarian lead-zinc ores are mined by underground methods at depths of more than 400 meters below the surface. The typical minerals are galena, sphalerite, chalcopyrite, pyrite, anglesite, and marcasite. The ore of the Gorubso mines averaged approximately 1.9% lead and 1.5% zinc in 1978. Lead concentrate (70% lead) and zinc concentrate (52% zinc) were processed mainly at the Plovdiv and Kurdjali smelters. Bulgaria's planning authorities earmarked 60% of the total amount allocated for geological investigations of solid mineral resources during the 1981-90 period for nonferrous metals exploration, which includes exploration for lead-zinc ores. The 1980 plan called for renovation and expansion of the lead-zinc mines of the first, fourth, and fifth ore administrations of the Gorubso Mining Enterprise. The development plan anticipated large investigations for new lead-zinc deposits in the Osogovo and Lozen regions.[21]

Cement.—Bulgarian cement production was expected to reach 6.6 million tons in 1980. A new cement plant was underway in 1979 at Temelkovo, west of Sofia.[22] Reportedly, construction of the Devnya cement plant was completed in 1978.

Fertilizer Materials.—Consumption of nitrogen fertilizer in Bulgaria has stagnated in recent years, and extra production has been available for export. In 1978 and 1979, the main purchasers of Bulgaria's nitrogenous fertilizers were Greece, Egypt, and Syria. Urea was exported mainly to India, Egypt, and Vietnam. Ammonia plants at Dimitrograd and Stara Zagora were being renovated to enable them to use Soviet natural gas and to increase production capacities.[23]

In 1978, Denmark's Haldor Topsoe signed a $10 million contract in which the company agreed to supply Bulgaria's Vratsa complex with a 400-ton-per-day gas preparation unit for nitrogen-ammonia synthesis. The agreement called for payment in the form of products, including ammonia and urea, over a period of 7 years.

Technipetrol (Italy) signed a $16 million contract in 1978 for a 200,000-ton-per-year urea plant it was to supply for the Vratsa complex. Compensation arrangements involved the purchase of Bulgarian mechanical equipment and forklift trucks. The urea plant was being designed to utilize Snamprogetti technology and was expected to be completed by mid 1981. Orenburg gas was expected to play a major role in the expansion of nitrogen fertilizer production in Bulgaria during the 1981-85 5-year plan period.[24] The Bulgarian state corporation Bulgargeomin planned to mine phosphate rock in Angola. A cooperation agreement was signed between the two countries for mining at an initial rate of 15,000 tons of rock per year, with the output to be used for processing into fertilizers. Jordan planned to supply 500,000 tons of raw phosphate rock to Bulgaria during the 1980-82 period, according to the Jordan Phosphate Mines Co.

Marble.—Large reserves of white and gray marble have recently been discovered in the southern Pirin mountain range (Kurdjali district). They are estimated at over 2 billion cubic meters, and large-capacity quarries are expected to be developed. Production in this region was projected to reach 2 million cubic meters of marble blocks and 250,000 square meters of marble tiles by 1980. It was anticipated that part of this production will be available for export. Mineralimpex annually exports some 5,000 cubic meters of marble in blocks and about 40,000 square meters of slabs. Marble is exported to many countries,[25] including Poland, the German Democratic Republic, Czechoslovakia, Belgium-Luxembourg, Denmark, Austria, the German Federal Republic, Lebanon, and Egypt.

MINERAL FUELS

Estimated primary energy production derived from fossil fuels, hydroelectric, and nuclear generation in Bulgaria was 15.0 million tons of standard coal equivalent (SCE) in 1979, compared with 14.8 million tons of SCE in 1978. In 1979, the estimated share of coal (lignite, brown, and bituminous) in the total primary energy production was 89.3%; the share of crude oil, 2%; natural gas, 0.7%; hydroelectric power, 2.7%; and nuclear energy, 5.3%. The total consumption of primary energy increased from 48.5 million tons of SCE in 1978 to an estimated 49.9 million tons of SCE in 1979. In 1979, coal provided estimated 40.5% of the total consumption while oil represented 39.7%; natural gas, 16.2%; hydroelectric energy, 0.8%; nuclear energy, 1.6%; and imports of energy 1.2%.

Table 4.—Bulgaria: Total primary energy balance for 1978 and 1979

(Million tons of standard coal equivalent)[1]

	Total primary energy	Coal (bituminous, brown, and lignite) and coke	Crude oil and petroleum products	Natural gas	Hydro-electric power	Nuclear power	Other sources of energy
1979:[e]							
Production	15.0	13.4	0.3	0.1	0.4	0.8	--
Imports	35.0	6.8	19.5	8.0	--	--	0.7
Exports	.1	--	--	--	--	--	.1
Apparent consumption	49.9	20.2	19.8	8.1	.4	.8	.6
1978:							
Production	14.8	13.3	.3	--	.4	.8	--
Imports	33.8	6.7	18.5	8.0	--	--	.6
Exports	.1	--	--	--	--	--	.1
Apparent consumption	48.5	20.0	18.8	8.0	.4	.8	.5

[e]Estimated.
[1]1 ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are as follows: Hard coal 1.0; brown coal and lignite, 0.5; crude oil, 1.47; natural gas (1,000 cubic meters), 1.33; hydroelectric and nuclear power (1,000 kilowatt-hours), 0.125.

Coal.—Production fell some 2.2 million tons short of planned output in 1978 and was 1.7 million tons short in 1979. The main reason was the continuing delay in putting new mines into operation on schedule. The U.S.S.R. and Poland supply all of Bulgaria's coal imports. In the 1978-79 period, most of the domestic coal production came from poor-quality lignite deposits in the Maritsa-Istok mines, which can be used only for thermoelectric power stations.[26] In addition to the Maritsa-Istok lignite and Pernik brown coal fields, which are gradually being depleted, Bulgaria increasingly has exploited the Bobov Dol brown coal deposits in the southwestern part of the country. These deposits have been estimated at 200 million tons, enough to supply the 450-megawatt power station built there for 50 years. New capacities of 2.4 million tons are planned to be developed in 1980, and an additional 1.2-million-ton capacity was planned for development in 1981. Emphasis was being placed on development of the following mines: Troyanovo 3, Bobov Dol, Edravets, and Cherno More 2.

The Ministry of Power Supply made a decision to develop the new Zdravets underground mine, with a projected annual output of 2 million tons per year of cleaned coal, at the Marbas mining and power complex. Plans were for the mine to be located on the right bank of the Martinika River, about 250 meters south of Strausko Village.[27] Development of the mine was expected to take 7.5 years, and it was anticipated that another 5 years would be required to reach full projected capacity.

In the 1981-85 5-year plan period, it was anticipated that greater attention would be paid in the area of coal mining to improving the utilization of available equipment.[28]

In 1979, a decision was made to accelerate the exploration of the Dobrudja coal basin in northeastern Bulgaria. A complex program was prepared under the supervision of the Committee on Geology, the Ministry of Power Supply, and the Ministroy (Mine Construction Trust). Two experimental shafts were scheduled to be built by the end of the 1981-85 5-year period. The Dubrudja basin coal reserves are estimated at 1.2 billion tons. They lie at a depth below 1,300 meters under water-bearing formations.[29] The coal has a calorific value of about 7,000 kilocalories per kilogram, good coking qualities, and low ash and sulfur contents.

Gas.—In 1978 and 1979, despite some newly discovered gas deposits, domestic gas production continued to be insignificant. The U.S.S.R. supplied all of Bulgaria's gas imports. It was projected that 6 billion cubic meters of gas would be conveyed in 1980 through the U.S.S.R.-Bulgaria pipeline. The first stage of the Devnya-Burgas-Stara Zagora-Dimitrovgrad-Plovdiv-Sofia southern branch was near completion in 1979.

Petroleum.—Production of crude oil in Bulgaria was insignificant in 1978 and 1979. Petroleum supplies came mainly from the U.S.S.R., but were also imported from Iran and Libya. Deliveries of crude oil were estimated at about 13 million tons for 1980. The total capacity of Bulgaria's three refineries was reported to be about 14 million tons per year; approximately 11.5 million tons was processed annually in both 1978 and 1979.[30] Reportedly, Bulgaria needs about 7 million tons of petroleum products per year for its own needs. The remainder is reexported as an important source of hard currency.

The research team of the Marine Research and Oceanology Institute of Varna and specialists from Moscow University continued their geophysical research of the Black Sea shelf zone in 1979.

The Mineral Industry of Burma

By Gordon L. Kinney[1]

Burma's current mineral output was small by world standards, although Burma was a producer of some consequence before World War II and still is considered to have a good potential for expansion. Burma's major minerals included lead and zinc, which came mostly from the famed Bawdwin mine, once the richest lead-zinc lode mine in the world but now mining much lower grade material. Tin and tungsten production was important and came from a variety of small-scale placer and lode mines and few larger Government-owned mines. Burma was one of the few Southeast Asian countries to produce sufficient petroleum and natural gas to meet its domestic needs, and there was a small amount of crude oil exported in 1979. Burma also produced excellent quality jade and other gem minerals.

About 67,000 persons, or 0.5% of the active labor force, were employed in mining activities at the beginning of 1978, and 68,000 during 1979. These miners accounted for approximately 1.8% of the net output of goods and services. Burma's mineral industry was managed primarily by four state-owned corporations. The No. 1 Mining Corp. controlled the lead, zinc, and silver output, which came mostly from its Bawdwin mining operation. It will also run the Monywa copper enterprise. The No. 2 Mining Corp. ran all the major tin and tungsten operations and the Heinze dredging project. The No. 3 Mining Corp. mainly was in charge of the Kalewa and Namma coal mines and the Moulmein and Loikaw antimony mines. The industrial minerals such as barite, limestone, and gypsum were managed by the No. 4 Mining Corp. The No. 3 Corp. was given the responsibility for the planned direct-reduction steel plant in 1979.

The Government's policy in running these mines was that no foreign investment was accepted, and the mines would have no special marketing arrangements with foreign corporations or governments. As a result, very little foreign capital has been available for developing new mines or for modernizing or expanding old ones.

The Government's third 4-year plan, beginning in FY 1978-79, stated that the fullest possible utilization of natural resources was necessary in order to attain the desired economic goals. It mentioned that certain projects may require capital or technical know-how beyond the means of the state. "In such cases, mutually beneficial economic cooperation with foreign enterprises public or private will be considered for specified periods, provided they are not detrimental to the Socialist system."[2] How much of an effect this apparent change will have on the investment climate remains to be seen.

It was planned that some old mines would be reopened, and some of the operating mines would be modernized and expanded with the help of foreign aid donations and loans. Security problems near the mines have been a deterrent to large-scale foreign loans in a few cases. However, although problems still exist in some areas, others have been alleviated, and the overall security situation was somewhat improved.[3] The security situation has also been a factor in exploration for new deposits in geologically favorable areas of Burma. The detailed ground surveys and drilling needed for resources exploration and development have not been conducted in some areas. The Department of Geologic Survey and Mineral Exploration (GSE) made no major discoveries during the year. However, the GSE was expected to increase its fieldwork during 1978 and 1979, after several years of relatively low activity and expenditures.

Gross national product (GNP) for FY 1978-79 was estimated at just over $4 billion at current prices.[4] The revised figure for the previous year was $3.9 billion. GNP at constant 1969 prices was $1,807 million in FY 1977-78 and $1,825 million in FY 1978-79. The chronically high inflation rate appeared to have taken a turn for the better as the Rangoon consumer price index (1972=100) declined about 4% for the year to 246. Overall exports were reported to be $294 million and imports increased to $477 million in FY 1978-79.[5] The balance of trade reflected the increase in imports and jumped from a $70 million deficit in FY 1977-78 to a deficit of more than $180 million in FY 1978-79. The mineral sector was a small part of Burma's GNP and trade volume, and not comparable to the agricultural sector in importance.

In 1978, the weather conditions were ideal for the rice crop, the most important product of Burma's highly agricultural economy. Burma escaped the late-season floods which hit neighboring countries, and estimates indicate a record paddy harvest, possibly as high as 10 million tons versus less than 9 million tons in 1977. Rice was the major export item and foreign exchange earner and thus of extreme importance to the overall economy.

PRODUCTION

The value of the output of the mineral sector increased substantially in FY 1977-78 to nearly $80 million at current prices.[6] FY 1978-79 value data were not available, but the reported tonnages for calender year 1978 for all nonfuel minerals except jadeite increased, in some cases dramatically. This across-the-board rise in production, the first in several years, was attributable to three major factors: (1) larger overall budgetary allocations for the mining sector; (2) bilateral and multilateral economic assistance for mining, enabling the mining corporation to acquire new equipment and to utilize the available equipment more effectively; and (3) a Government program of "commercialism" for the mining companies providing the workers with better incentives.[7] The Government plan for 1979-80 targeted small increases for nearly all of the important mineral products.

The most valuable mineral output of the economy was crude oil, followed by the gem minerals, tin, tungsten, and lead.

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, pottery clay, common sand, glass sand, other varieties of crude construction stone, and other varieties of gem stones are also produced, but available information is inadequate to make reliable estimates of output levels.

[2]Reported figure.

[3]Data are for fiscal years beginning Apr. 1 of that stated.

[4]Includes fire clay powder.

[5]Data exclude products used as fuel in refineries.

TRADE

The mining industry usually ranked third after agriculture and forestry products in value of exports. While detailed trade data were not available, the relative importance of the mining sector was not believed to have changed in 1978 and 1979. Burma generally exports nearly all of its nonfuel mineral output, particularly in the metallic sector. Mineral fuels were consumed domestically.

There was a rise in exports of all minerals and ores, both in quality and value in comparison with 1976, the last calendar year for which individual figures were available. Overall, the estimated value of mineral exports during 1978 constituted 11% of Burma's total export earnings as against 7% in 1976.[8]

COMMODITY REVIEW

METALS

Copper.—Burma and Yugoslavia signed a $70 million loan agreement for the development of the Monywa copper project. The deposits are located just west of the Chindwin River, opposite the railhead town of Monywa. The main deposits are in the Kyesintaung and Sabetaung ranges. The Kyesintaung deposit contains 55 million tons grading about 0.5% Cu, and the Sabetaung deposit, 26 million tons grading just over 1.02% Cu.[9] Open pit mine workings will be scaled to produce 2.4 million tons per year of ore. The ore will be processed in a flotation plant with a capacity of 60,000 tons per year of concentrate containing 22% to 25% Cu. Related infrastructure will also be established. Design and technology will be supplied by RTB Bor, Yugoslavia's copper mining and smelting conglomerate, together with other Yugoslavian firms. The Yugoslavians will build the plant and assist the Burmese in the early stages, but the Burmese officials will be in full charge of management and operations. Much of the excavation hardware reportedly will be supplied by American manufacturers or their licensees. The concentrate will be exported. Construction on the concentrator was scheduled to begin in early 1980 and the entire contract was to be completed within 4 years. The agreement did not include the building of a copper smelter and refinery, which were still in the planning stage.

Currently the country's copper production ranges from 100 to 200 tons per year of copper matte, obtained as a byproduct from the Namtu lead smelter.

Iron and Steel.—In July 1979 the No. 3 Mining Corp. reportedly signed a turnkey contract with Italy's Danieli & C. Spa. for a 20,000-ton-per-year Kinglor Metor direct reduction plant, a 15-to 17-ton electric arc furnace, and for metal casting equipment. Provision for later expansion included a continuous billet casting machine. The total cost of the contract was valued at DM33 million. The plant will be located at Anisakan in Maymyo township.

Lead and Zinc.—Most of the lead and zinc concentrate production, valued at nearly $5 million, came from the famed Bawdwin mine in northern Shan State. Once one of the richest lead mines in the world, production had been hindered by declining ore grade and deteriorating mine and plant facilities. The decline in ore grade was a relative one as the run-of-mine ore averages over 10% combined metal content. Earlier high-grade ore veins were mined selectively at over 40% metal content. However, in 1978, the nearly 225,000-ton ore production was the highest since 1970 because grants and credits from the Federal Republic of Germany (FRG) enabled the No.1 Mining Corp. to acquire new equipment and rehabilitate the existing plant. Modernization of the workshop with a DM5 million grant was completed, and the improved facility was operating at yearend 1978. Updating the workshop was critical because spare parts for the 65-year-old equipment and facilities were difficult to obtain and transportation to the mine was subject to attack by insurgents and bandits. Virtually all spare parts and replacements will now be fabricated in the well-equipped workshop.

The DM5 million credit obligated in 1976 for development of an open pit mine at Bawdwin had not been utilized by mid-1979. It was still planned to begin the open pit operation as soon as feasible. Conversion of Bawdwin mine to an open pit operation would generate a large increase in ore production.

The mine operates its own narrow-gage railroad, which runs from Namtu 22 kilometers west to Bawdwin and 51 kilometers east to Namyao. In 1978, the No. 1 Mining Corp. ordered 10 diesel locomotives to replace the worn out and cannibalized steam equipment which had been used for decades. The current needs were for four locomotives, but the remainder will be needed as ore production is increased over the next 2 years. This approval to procure capital equipment in advance of immediate needs was unprecedented among Burmese Government agencies.

Plans for the zinc smelter slated for Pyinmana, to be beyond the reach of insurgents, have been dropped. FRG-financed feasibility studies, to utilize the huge quantity of lead and zinc tailings and slag accumulated over the past 65 years at Bawdwin, were planned. One study will consider the production of zinc oxide clinker from the zinc-rich smelter slags by the Waelz process. The second will examine the possible recovery of silver by a leaching process from the lead-zinc flotation plant tailings. The studies were scheduled for completion by yearend 1980.

Tin and Tungsten.—These were the most valuable metallic minerals produced in Burma with exports totaling over $12 million in 1978. The major mines were at Heinda, Kanbauk, Myinmatti, Natsan, and Yadanabon. Numerous small-scale private mining operations sell their output to the Government and contributed more than one-half of the total concentrate. Unstable conditions, however, permit considerable illicit tin and tungsten mining with the output being smuggled out of Burma to Thailand, Malaysia, or Singapore.

Production of tin and tungsten concentrates increased substantially for the second straight year, partly because of the production from the modernized Heinda tin mine and concentration plant. Heinda was the country's largest tin producer, turning out approximately 500 tons in 1978. The new mill ran into problems with ore characteristics that were not anticipated in the design of the plant. As a result, the FRG was to provide additional funding for modifications which will permit recovery of extremely fine-grained cassiterite not encountered in previous run-of-mine ore. The plant was designed to produce 1,000 tons of 72% tin concentrate per year.

The Government's FY 1979-80 plan called for another increase in tin and tungsten production. Preliminary production data for the first three quarters of 1979 indicate output of the concentrates and mixed tin-tungsten concentrates did indeed increase substantially over the same period in 1978.

Exploration was still underway at the Hermingyi underground tin mine. A study was to be made to determine if further development work was worthwhile.

The rich tin-tungsten deposits along the Tennassarim coast in south Burma were still not being efficiently exploited during 1978 and 1979. However, work was underway and orders were placed for all of the major equipment needs under the tin-tungsten expansion project funded by a $16 million International Development Association credit. This project was designed to exploit the alluvial deposits in the shallow offshore areas. The new dredge and processing equipment will not be available until late 1980.

NONMETALS

Overall, the industrial mineral sector had a particularly good year in 1978. Limestone production jumped in response to increased demand from the new Kyangin cement plant and various construction projects. The capacity of the new cement plant was not announced, and it was unclear how much of the 340,000 tons produced in 1978 came from the new plant or how many other plants contributed to the total. The Government plan proposed cement output at 400,000 tons for FY 1979-80. Barite output more than doubled in 1978, reflecting an increase in domestic and foreign oil well drilling. The plan target called for another substantial increase in barite production to 47,000 tons in FY 1979-80. Graphite, industrial clay, and dolomite each more than doubled the 1977 tonnages in 1978, and all other reported industrial minerals showed increases over those of the previous year. Brick and tile production also reflected an increase in construction activity during the year. Production was planned at over 150 million units for FY 1979-80, probably equating to around 350,000 to 400,000 tons of finished material.

Burma's Government planned to meet the fertilizer requirements of the agricultural sector in the next decade by adding a 91,000-ton-per-year N urea complex to the two 31,000-ton-per-year N urea plants already in operation, one in Pagan, the other in Sale. Like the existing units, the new plant will use natural gas as feedstock and fuel and will be located somewhere along the Irrawaddy River. The original choice of Kyungchuang was rejected because the water there was too shallow for barge transport of the product.[10]

In January 1978, the FRG agreed to provide a DM90 million low-interest loan as financial assistance to Burma for the construction of the new plant. Construction was reportedly due to begin about the end of 1979.

MINERAL FUELS

Coal.—Burma has few known deposits of coal and what was mined was poor quality. The main producer in 1978 and 1979 was the Kalewa coal mine where output increased for the second straight year and about doubled since 1974. The 33,000-ton overall output in 1978 was of little importance to the economy, and there were no known plans for large-scale expansion of production. The Government's target for FY 1979-80 coal production was set at about 38,000 tons. The coal, blended with high-quality imports, was consumed mainly in steam locomotives and small electric powerplants.

Petroleum and Natural Gas.—Burmese Government statistics indicated that crude oil production continued to climb in both 1978 and 1979. In July 1979 a Japanese firm signed a contract with Burma's Government owned oil company to purchase several thousand barrels per day of crude oil. The amount was to be the difference between daily production and the current capacity of Burma's refineries. Burma's ability to store oil in excess of its needs either at the oilfields or at the refineries was very limited. The first shipment arrived in Japan at the end of September 1979. The foreign exchange earned from the sale will strengthen Burma's balance of payments considerably.

Because of limited refinery capacity, motor fuels and kerosine were in short supply during 1978, particularly in northern Burma and in the outlying States. There were reports of industrial stoppages due to lack of fuel.[11] The Government's firm policy of not importing petroleum was exacerbating the shortages at a time of rising demand by industry and the populace.

In order to supply the increasing needs for petroleum producers, a new 25,000-barrel-per-day refinery was being built at Mann oilfield, with financing and construction being carried out with Japanese assistance. Completion was scheduled for 1982. In addition, the 20,000-barrel-per-day Syriam refinery was slated for modernization, also with Japanese aid.

There was no offshore exploration activity in Burma in 1978 or 1979; however, in October 1978 the Government issued an invitation to foreign oil companies to submit bids on all offshore blocks, including those previously withheld for Government use. Reportedly only three firms made formal conditional responses. Lack of interest on the international oil companies' part was attributed to comparatively unattractive terms, very high data fees, and costly Government operation regulations.

Onshore exploration was conducted solely by the Government's Myanma Oil Corp. (MOC). It was not anticipated that foreign firms would be invited to participate. Exploration activity was considerably lower in 1978 than in previous years, mostly because of cuts in the MOC operating budget. There were no confirmed reports of significant finds in 1978 or 1979.

MOC took delivery of several new drilling rigs and ordered several more during 1978. The new equipment should enhance the future onshore exploration and development program.

Work was completed in April 1979 on the major pipeline connecting the Mann oilfield with the Syriam refinery near Rangoon. The final 280-kilometer section of 25.4-centimeter pipe was laid between Prome and the refinery. Completion of the line eliminated the slow and costly river barge traffic formerly used to deliver most of the crude oil to the refinery.

The Mineral Industry of Canada[1]

By Charlie Wyche[2]

Although the relatively depressed state of the world's industrial economies resulted in reduced demand for Canadian minerals in 1978, Canada's mining and mineral processing industries both showed impressive gains in 1979. The value of mineral production rose strongly in all but one of Canada's provinces and territories. Although the volume of output fell for some major metals in 1979, higher prices improved the outlook for producers and stimulated many investment projects. Mines that had long been abandoned were reopened, existing mines were expanded, mining employment increased, and new exploration projects were started. The most significant market improvements were for precious metals, copper, aluminum, rolled steel, molybdenum, and potash.

The fuel sector also made impressive gains and attracted new capital for exploration and development. Offshore oil and gas discoveries made in 1979 were encouraging and helped to make Canada's announced goal of self-sufficiency in the 1990's much more attainable. Prices for coal and uranium remained strong, and both industries grew and prepared for future expansion during 1979.

PRODUCTION

According to the Canadian Department of Energy, Mines and Resources, overall mineral production and production value rose only slightly in 1978, compared with the 1977 levels, but were up significantly in 1979. The total value of domestic mine output in 1978 increased only slightly, to $17.2 billion,[3,4] but the value in 1979 increased by more than 29% and reached $22.2 billion. Mineral production value accounted for 8.5% of the 1978 gross national product (GNP), which was estimated at $202.1 billion, and 10% of the 1979 GNP, which was estimated at $216.7 billion. The value of metals produced increased 51% in 1979, to $6.8 billion, compared with $4.5 billion in 1978. The production value of mineral fuels increased 25% during 1979 and reached a record high of $12.4 billion. The value of nonfuels mineral production increased 33% above the 1978 level, to $10.0 billion. Production values of the leading mineral commodities in 1979 were as follows: Crude petroleum, $6.5 billion; natural gas, $4.0 billion; iron ore, $1.6 billion; copper, $1.3 billion; natural gas products, $1.2 billion; and zinc $0.9 billion.

Although a few of the provinces and territories actually increased production of some commodities in 1979, the sharp increases in value were due mainly to higher prices. Real growth was small or nonexistent, and for copper, gold, silver, lead, molybdenum, platinum metals, and uranium, output in physical terms declined in most regions. The most significant changes of the year occurred in the gold market, where the price increased more than 200%. The Province of Alberta, with its large oil and gas output, accounted for approximately 50% of Canada's total mineral production value in both 1978 and 1979. The mineral production values of the provinces and territories in 1978 and 1979 were as follows:

Province or territory	Value, billion dollars	
	1978	1979
Alberta	8.6	11.0
Ontario	2.3	2.8
British Columbia	1.6	2.3
Quebec	1.6	1.9
Saskatchewan	1.3	1.5
Newfoundland and Labrador	.54	.94
Manitoba	.36	.50
New Brunswick	.27	.45
Northwest Territories	.27	.35
Nova Scotia	.18	.17
Yukon Territory	.20	.26
Prince Edward Island	([1])	([1])
Total	17.22	22.17

[1]Less than 1/2 unit.

In 1979, Canada was the world's largest producer of asbestos, zinc, silver, and nickel; the second largest producer of potash, gypsum, molybdenum, and sulfur; and a leading producer of uranium, titanium, aluminum, cobalt, gold, lead, copper, iron, and platinum. Mineral deposits are located in all regions of Canada.

In January 1978, there were 345 nonfuel mining operations in the country. In metal mining, there were 109 underground mines, 43 open pits, 8 combination underground and open pit operations, 1 surface tailing operation, and 59 placer gold operations. In nonmetal mining, including construction materials, there were 18 underground mines, 102 open pits, and 7 solution-mining operations.

Total do	624,562	659,003	664,015	[1]710,841

[e]Estimate. [p]Preliminary. [r]Revised.
[1]Reported figure.
[2]Sb content of antimonial lead alloys, flue dust, and dore slag, estimated on the basis of reported gross production.
[3]Refined metal and bullion from domestic ores plus recoverable Bi content of exported concentrates.
[4]Refined metal from domestic ores plus recoverable Cd content of exported ores and concentrates.
[5]Actual output not reported. Data represent Co content of all products derived from ores of Canadian origin, including nickel oxide sinter shipped to the United Kingdom and nickel-copper-cobalt matte shipped to Norway for further processing.
[6]Actual output not reported. Data represent the output within Canada of metallic cobalt from ores of both Canadian and non-Canadian origin.
[7]Blister copper from domestic ores plus recoverable Cu content of exported matte and concentrates.
[8]Includes shipments of ingots from primary plants for rolling elsewhere.
[9]Refined nickel from domestic ores plus Ni content of oxide produced and recoverable Ni content of exported matte.
[10]From all sources, including imports and secondary sources.
[11]Cement shipped and/or used by producers.
[12]Includes bentonite products from common clay, stoneware clay, fire clay, and other clays.
[13]Crushed, building, ornamental, paving, and similar stone.

TRADE

In 1978, Canada's exports of crude and fabricated mineral products totaled $12.3 billion, which was 10% above the value of these exports in 1977. These mineral exports accounted for 28% of the country's total 1978 exports of $44.6 billion. Total exports for 1979 were $16.8 billion, or 37% more than in 1978. Export volumes were down for many commodities, but values were up. Of the leading export commodities, based on the first 9 months of 1979, only primary aluminum, refined copper and nickel (in oxide and refined metal) showed decreases in value from the previous year. For these commodities, volumes were down due to strikes in each industry, and the increases in value were not enough to offset the sharp drops in production. Exports of lead in ores and concentrates showed a 33% increase in volume in 1979 and a 187% increase in value. About 70% of these exports went to U.S. markets and 13% went to members of the European Economic Community (EEC), principally the United Kingdom.

Imports of crude and fabricated mineral products totaled $5.7 billion, accounting for 14% of total imports, which were valued at $42 billion in 1979. Crude petroleum imports totaled $3.8 billion and accounted for 9% of all mineral imports. The principal sources of oil imports were Venezuela and Saudi Arabia. Imports of coal, valued at $734 million, came primarily from the United States. Other major mineral imports were bauxite, alumina, and aluminum scrap ($223 million combined) and iron ore and iron and steel scrap ($274 million combined).

Natural	40	1,065	Mainly to United States.
Fused alumina, crude and grains	154,308	167,363	Do.
Silicon carbide, crude and grains	86,051	107,350	Do.
Grinding and polishing wheels and stones value, thousands	$794	$677	United States $558.
Asbestos:			
Crude	1	1	All to United States.
Milled fiber, all grades thousand tons	1,415	1,399	United States 540; Federal Republic of Germany 150.
Barite, crude	69,421	56,783	United States 43,082; Venezuela 13,701.
Cement, portland thousand tons	1,275	1,635	Mainly to United States.
Clays and clay products (including all refractory brick):			
Crude, including refractory do	766	1,103	Do.
Products:			
Refractory (including nonclay brick)[6]	40,809	54,409	United States 33,697.
Nonrefractory value, thousands	$2,593	$5,009	Mainly to United States.
Diamond:			
Gem carats	41,843	36,805	Belgium-Luxembourg 14,518; Israel 8,524; United States 6,576.
Industrial (including dust) do	250,075	180,801	United States 120,855; Australia 22,431.
Fertilizer materials:			
Natural and manufactured:			
Nitrogenous thousand tons	1,051	1,284	Mainly to United States.
Potassic do	9,206	9,387	Do.
Other, including mixed do	579	558	United States 434; Pakistan 111.
Ammonia do	574	481	All to United States.
Gypsum, crude do	4,994	5,179	Mainly to United States.
Lime	359,539	478,551	Do.
Nepheline syenite	443,763	420,961	Do.
Pigments, mineral, including processed iron oxides	15,067	26,853	Do.
Precious and semiprecious stones, except diamond value, thousands	$3,384	$4,581	United States $2,412.
Salt and brine thousand tons	1,163	1,609	Mainly to United States.
Sand and gravel do	274	270	Do.
Sodium sulfate	117,123	129,119	All to United States.
Stone:			
Limestone, crude, crushed, and refuse thousand tons	1,502	1,711	Do.
Quartzite do	56	68	Mainly to United States.
Rough building and crude stone, n.e.s do	196	564	United States 506.
Sulfur:			
Crude and refined do	4,291	4,985	United States 1,182; Republic of South Africa 460.
Sulfuric acid, including oleum do	294	205	Mainly to United States.

See footnotes at end of table.

Table 2.—Canada: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Talc, steatite, soapstone, pyrophyllite[2]	310	116	All to United States.
Other, crude ____ value, thousands	$84,184	$96,354	Federal Republic of Germany $23,921; United States $23,489.
MINERAL FUELS AND RELATED MATERIALS			
Coal, bituminous ____ thousand tons	12,069	13,658	Japan 10,865.
Coke from coal	200,678	217,779	United States 153,135; Federal Republic of Germany 64,600.
Fuel briquets of coal and coke	--	43	All to United States.
Gas, natural ____ million cubic feet	993,805	882,583	Do.
Peat	303,414	NA	
Petroleum:			
Crude ____ thousand 42-gallon barrels	120,894	97,984	Do.
Refinery products:			
Gasoline ____ do	2,441	1,209	Mainly to United States.
Distillate fuel oil ____ do	1,993	3,049	United States 1,309; Sweden 540; Netherlands 407.
Residual fuel oil ____ do	8,050	16,831	All to United States.
Lubricants ____ do	20	21	United States 12; Cuba 2; St. Pierre and Miquelon 1.
Other:			
Liquefied petroleum gas ____ do	46,869	36,182	Mainly to United States.
Asphalt ____ do	444	649	Do.
Petroleum coke and pitch coke ____ do	866	742	United States 577; Japan 133.
Total ____ do	60,683	58,683	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals ____ do	559	4,545	Mainly to United States.

NA Not available.
[1]May include relatively minor quantities of certain shapes not normally included among semimanufactures.
[2]Partial figures, including U.S. imports for consumption only.
[3]Includes some scrap.
[4]Largely, if not all, used in the production of heavy aggregate.
[5]Excludes scrap and sweepings valued at $25,891,000 in 1977 and $35,538,000 in 1978.
[6]Excludes quantity valued at $7,614,000 in 1977 and $8,327,000 in 1978.

[1]May include relatively minor quantities of certain shapes not normally included among semimanufactures.
[2]Less than 1/2 unit.

COMMODITY REVIEW

METALS

Exploration activity in all the provinces and territories remained high in 1978 and 1979, and some 9,000 claims were staked. The principal metals searched for were gold, copper, lead, zinc, and silver. Increased exploration activity resulted from sharp increases in the prices of most metals during 1978 and 1979, in particular gold, silver, and platinum. The price of gold moved from a low of $166 per troy ounce during 1978 to a high of $517 per troy ounce in 1979. Although silver production declined 6% in 1979, its value increased by 80%. Platinum output was down 47%, but recorded only a 14% decline in value.

The copper market was also very volatile in 1978 and 1979. As a result of an 8-month strike that started in September 1978 at Inco Ltd.'s Sudbury operation and a strike at Noranda Mines Ltd. at Gaspè, inventories were drawn down, and the volume of production was reduced in the first half of 1979. These factors, combined with improved consumer demand, caused the price of copper to escalate. The price was 86 cents per pound in January 1979, but by March it had risen to a high of $1.22 per pound. During the summer, the price stabilized and averaged approximately $1.00 per pound, but in September it reached a record high of $1.30 per pound. As the earnings of the copper producers improved substantially, several new mine openings and major programs to expand capacity were announced. Included in these announcements were the reopening of Highmont Mining Corp. and Valley Copper Mines Ltd. and an expansion program by Lornex Mining Corp. Ltd., which was already one of the largest copper producing mines in Canada. The aluminum industry also experienced a record price increase brought on by tight market supplies, due partly to labor problems at Aluminum Co. of Canada's smelter operations in Quebec. The nickel industry, plagued by layoffs and cutbacks in production in 1978, was more stable in 1979. Production was down in 1979, but prices reached record high levels. Lower production rates were also reported for lead, zinc, and molybdenum. The iron ore industry recorded a strong increase in output of about 40% over that of 1978. Many mines returned to full operation after the labor strikes of 1978, but the world industry continued to be plagued by problems of oversupply. However, the demand for steel remained strong, and several major producers made plans to double their capacities.

NONMETALS

In the asbestos industry, production, sales, and exports continued to increase in 1978 and 1979. The Quebec government continued with its exploration plans for Asbestos Corp. Ltd., by far the largest producer in Canada. In the potash industry, Potash Corp. of Saskatchewan instituted expansion plans based on forecasts of both steady and strong growth in world demand for fertilizer. Almost half of the world's known reserves of potash are in Saskatchewan. The value of potash production increased almost 38% in 1979, compared with that of 1978, and about 70% of the potash produced was exported to the United States. The demand for cement was strong, and new capacity was under development. Sulfur output increased some 18% over that of 1978, and Canada remained the world's largest exporter of sulfur. Gypsum production in Canada was up slightly over that of 1978, and lime producers operated at near capacity levels throughout 1978 and 1979.

MINERAL FUELS

The Canadian coal industry increased its output and prepared for future expansion during 1979. New coal mines and expanded production capabilities at existing mines were being developed to supply coal for this growing sector. Existing and potential coking coal producers were active in marketing and predevelopment work in an attempt to win contracts in traditional markets such as Japan and with new consumers in Asia, Latin America, and Europe.

In 1978 and 1979, many sectors of the Canadian petroleum industry surpassed the levels of activity achieved in 1977. Although established reserves of crude oil continued to decline, natural gas reserves increased substantially. The number of wells drilled in 1978 was 10% higher than the number drilled in 1977, and the number drilled in 1979 was 5% higher than it was in 1978. In 1978, 6,700 wells were drilled for a total of 7 million meters, and in 1979, 7,500 wells were drilled for a total of 8.6 million meters. Most of the drilling and exploitation activity during 1978 and 1979 occurred in Alberta. Expenditures for exploration and development increased by \$2.4 billion to an alltime high of \$10.5 billion in 1979.

Exports to the United States of crude oil, refined products, and liquid petroleum gas all increased during 1979. Although refinery capacity remained unchanged from 1978, many of the facilities were undergoing minor alterations to enable them to process heavier grade crude oils. Increased demand resulted in refineries operating at 77% of capacity, compared with 66% in 1978.

Uranium exploration and development activity remained high, particularly in Saskatchewan, where another potentially important new discovery was announced and one new production facility was under construction. According to the Department of Energy, Mines and Resources, some \$90 million was spent on exploration in 1979, of which \$50 million was spent in Saskatchewan. Extensive expansion programs continued in Ontario's Elliot Lake area, and new production projects were being planned in British Columbia and Newfoundland. According to the Department of Energy, Mines and Resources, some 300 exploration projects, many of which involved foreign participation, were recorded during 1979.

---

[1]For more detailed information on the mineral industry of Canada, see the Canadian Minerals Yearbook for 1978 and 1979 and the Canadian Mineral Survey for 1978 and 1979, both of which were prepared by the Mineral Development Sector, Department of Energy, Mines and Resources, Ottawa. The U.S. Bureau of Mines has arranged to have these Canadian publications placed in libraries in each of the 50 States and Puerto Rico at the following locations: University of Alabama, Tuscaloosa; E. E. Rasmuson Library, University of Alaska, Fairbanks; University of Arizona, Tucson; University of Arkansas, Fayetteville; California State Library, Sacramento; A. Lakes Library, Colorado School of Mines, Golden; Wilbur Cross Library, University of Connecticut, Storrs; H.M. [3]Where necessary, values have been converted from Canadian dollars (Can\$) to U.S. dollars at the rate of Can\$1.18=US\$1.00, the average exchange rate for 1979.

[4]Does not include the value of uranium production, which was not available.

The Mineral Industry of Chile

By Charles Hoyt[1]

During 1978-79 Chile retained its dominant role as one of the world's leading metal producers. It continued to rank second in world production of copper, rhenium, and iodine. In addition Chile is a significant producer of iron ore, molybdenum, natural nitrates, and vanadium. In the 1978-79 period the Chilean economy, as a result of the economic stabilization program initiated in 1975 and sharply rising copper and molybdenum prices in 1979, registered strong gains. Real gross domestic product in 1977 dollars[2] increased about 7% in 1979 compared with 1978, and the indices of industrial wages in 1978 and 1979 were 131 and 119 (1977=100). Specifically in 1979 Chile posted a balance of payments surplus of about $930 million and substantially increased its foreign exchange reserves to $2.5 billion compared with $1.6 billion in 1978. An important factor in this 1979 surplus was higher prices for copper exports, which were valued at over $1.8 billion compared with $1.2 billion in 1978. Despite this major increase in copper exports value, copper's share of total exports increased modestly in 1979 to about 52% compared with about 49% in 1978. This shows the progress of Chile's export diversification program since traditionally copper has represented 70% to 80% of the total exports.

Despite this export diversification, copper mining remains the dominant factor in Chile's economy, and the state-owned copper mining corporation, Corporacíon del Cobre (CODELCO) is by far the largest Chilean corporation, having assets in excess of $2 billion with current annual sales of $1.2 to $1.5 billion. It is over twice as large as the second largest firm, the national electric company, Empresa Nacional de Electricidad, S.A. (ENDESA).[3]

From January 1974 through August 11, 1978, there were almost $2.5 billion in foreign investments in Chile, of which nearly 90% were in mining projects. The leading foreign investors were the United States (67%) and Canada (24.4%).[4] Investment in mining is expected to increase substantially in the next few years as the long-range expansion program of Exxon in the Disputada de las Condes copper mine and envisaged development of the Quebrada Blanca copper deposit by U.S.-Canadian firms and others are realized. In the 1978-79 period the major event in the energy area was the startup of offshore petroleum production in the Magellan Straits Fields. By the mid-1980's, it is expected that domestic petroleum output will approach 60% of domestic needs, compared with about one-quarter at present.

Government Policies and Programs.—In 1978-79 the Chilean Government continued its major program initiated in March 1977 (Foreign Investment Statute, Law-Decree No. 1748) to encourage foreign investment in their economy. Although the Chilean Government plans to retain Government control over the existing mineral operations in copper, coal, nitrates, and iron ore, it is looking to private capital to expand output in copper and petroleum and natural gas developments and in some other areas. Numerous large-scale mining sector investment commitments (primarily copper) have been made. These are highlighted in the Metals section. ODEPLAN, the state planning authority, published a development plan for 1978-83 which continues the existing economic policies to foster resource development and place foreign investors on almost the same basis as Chilean investors. In the public investment plan for 1978-83, total public expenditures in excess of $7 billion are projected, of which the direct mineral and energy share was slightly over $1.4 billion distributed among large-scale copper mining (60.5%), coal-oil-gas (33%), and other minerals (6.5%).

In mid-1979 the Chilean Department of Mining began work on a 5-year program to develop a $5 million national registry of mines (estimated at 14,000 concessions) which would establish location and concession boundaries as well as categorize type and reserves of each concession. This plan hopes to minimize future litigation and foster further foreign investment if titles are clear. The survey covered 250 concessions in 1978 and 1,200 more in 1979. In 1979 the Chilean Government concluded technical cooperation and/or economic agreements with seven nations including Mainland China and also made an agreement with Egypt that provides for petroleum sales to Chile.

Mining investments in Chile receive no special tax concession, and there are no tax preferences given to domestic producers over foreign investors. A foreign mineral investor may choose between a tax rate of a fixed 49% for 10 years or a varying tax structure that in 1978 amounted to 49.5%, which is the rate paid by the state entities (CODELCO, etc.).

PRODUCTION

The increase in copper production in 1979 from 1978 resulted from gains in three of the four CODELCO mines. Molybdenum, a byproduct of copper mining, attained a peak level in 1979 as a result of efforts for improved recovery. The continued decline in onshore production of petroleum was more than made up by an increase in offshore production in the Straits of Magellan. But domestic production met only 23% of domestic consumption; this figure may increase to 35% by yearend 1980. Although a great deal of attention is being given to developing Chile's coal resources and expanded production, production in 1978 and 1979 continued to decline. Coal production for 1980 is estimated at 1.6 million tons, 400,000 tons below estimated demand.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed, lime and pyrites are also produced, but available information is inadequate to make reliable estimates of output levels.
[2]Figures are the nonduplicative copper content of ores, concentrates, precipitate, metal, and other copper-bearing products measured at the last stage of processing as reported in available sources.
[3]Reported figure.
[4]Figures are total blister and equivalent copper output including that blister subsequently refined in Chile and copper produced by electrowinning.
[5]Figures are total refined copper distributed into 2 classes according to method of refining.
[6]Excludes castings.
[7]Includes natural sodium sulfate and anhydrous sodium sulfate, coproducts of the nitrate industry.

TRADE

Preliminary data indicated that Chile showed a dramatic increase of 40% in the value of its total exports in 1979, estimated at $3.5 billion compared with about $2.5 billion in 1978. This resulted in a balance of payment surplus of about $930 million despite current account deficit of $911 million. This performance was partially based on an increase in copper prices (about 44%) and an increase in copper tonnage exported (estimated at 1,012,000 metric tons compared with 977,800 metric tons in 1978). Increases in molybdenum export and higher molybdenum prices were also contributing factors.

Like all petroleum-importing countries, Chile suffered from price increases; the cost of petroleum imports increased from $430 million in 1978 to $770 million in 1979 and is projected at $1 billion in 1980 based on imports of about 30 million barrels.

COMMODITY REVIEW

METALS

Copper.—Mine production of copper dropped in 1978 primarily because of declining ore grades, but it was projected to increase in 1979 because of production gains in three of CODELCO's mines. The long-term outlook for Chilean copper production is excellent because of the country's enormous copper reserves, increased foreign investments, and rising world prices for copper.

Extensive foreign investments were made in Chile's copper industry in 1978-79. The largest single investment was Exxon Minerals Chile, Inc.'s $110 million purchase of the La Disputada de las Condes Mining Company (Compañía Minera Disputada de Las Condes, S.A.), which operates the La Disputada and El Soldado copper mines. The purchase contract specifies that Exxon may invest $1.2 billion to expand current ore production of 4,800 tons to an ultimate capacity of 80,000 tons per day by the late 1980's. Exxon's immediate plans were to increase mill capacity to 8,400 tons per day. Another major feasibility program underway in 1978-79 is the Quebrada Blanca project in which a U.S.-Canadian consortium (Falconbridge Nickel Mines Ltd., The Superior Oil Company, Ltd., and McIntyre

Mines Ltd.) is considering a $500 million investment. The Anaconda Company also invested in Chile by the $20 million purchase of the Los Pelambres deposit near the Argentine border northwest of Santiago. The deposit has ore reserves in excess of 400 million tons with indicated grades of 0.78% copper and 0.033% molybdenum. A $12 million investigation program is underway to determine suitable levels of output. Capital investments as high as $1.2 to $1.5 billion are under consideration. Another major copper development that was finalizing in late 1979 was the Andacollo copper project, which has been under investigation since late 1977 by Noranda Mines Ltd. In mid-1979 Noranda and Empresa Nacional de Mineria (the Chilean state mining corporation) announced plans to jointly mine the Andacollo deposit. The planned mine-mill complex would produce 70,000 metric tons of copper with an estimated capital investment of $350 million. Another important private foreign investment copper project with potential capital investments of $80 million by Compania Minera San Jose, Inc., a subsidiary of St. Joe Minerals Inc., intended development of the gold-silver-copper deposit known as El Indio located about 100 miles east of La Serena. Mid-1979 reports indicate reserves of 2.2 million tons grading 2.8% copper, 0.5 troy ounce of gold per ton, and 4.4 troy ounces of silver per ton. The mine would be developed over a 2-year period.

The state copper mining corporation, CODELCO, that produces over 85% of Chile's copper output, has extensive plans for major capital investment programs at their four large mines that are both underway and in feasibility studies. CODELCO reportedly has an investment program of $892 million for 1978-82 and was expected to invest about $170 million in 1979 and up to $245 million in 1980. Investments in Chuquicamata include an expansion of concentrating capacity ($50 million), new crushing and conveyor facilities ($120 million), and equipment replacement ($15 million). Conversion to trucks from rail haulage has already taken place. At the El Teniente operation, similar major investments are underway, with infrastructure ($40 million), concentrating treatment expansion ($12 million), and tailings dump expansion ($80 million) all underway. The CODELCO smelter operations, El Salvador and Andina, also have major expansions underway. At El Salvador these programs include a 20% to 30% crushing and concentrating expansion ($30 million), smelter modernization ($11.5 million), and electrolytic refinery construction ($6.5 million). At Andina the current expansions are a wash plant ($30 million) and a new tailings disposal site ($33 million).

Iron Ore.—Iron ore production increased substantially in 1978 because of increased activity in the El Algarrobo Mine, which had to provide ore to the $250 million Huasco Valley project, Chile's first iron ore pelletizing complex and one of the world's largest. This plant was inaugurated in March 1978. The first shipment of self-fluxing pellets was made to the Ogishima works of the Japanese firm Nippon Kokan K.K. A 10-year contract has been made with the Mitsubishi Corporation for almost the entire output of this plant (33 million tons over 10 years). Mitsubishi also reportedly provided over $112 million of the total financing for the project. Almost 1.9 million tons of pellets were produced and 1.6 million tons (65% Fe, 0.5% P, and 0.3% S) were shipped in 1978, and it was expected to get the plant up to full capacity in 1979. Cia. de Acero del Pacifico S.A. (CAP) operates three surface iron ore mines: El Agarrobo, which provides feed to the pellet plant, El Romeral, and Santa Fe. In 1979 the El Romeral Mine, located in northern Chile near La Serena, celebrated its 25th year of operation. An excellent comprehensive article describing this mine appeared in a trade journal[5] during 1979. In 1978 production at El Romeral declined to under 3 million tons, and output at the Santa Fe Mine dropped to under 2 million tons.

Iron and Steel.—Expanding domestic consumption of steel provided the impetus to increase CAP's 1978 semifinished product steel output 13% over that for 1977.

Steel shipments for 1978 from the Huachipato steel mill were almost 392,000 tons, of which 94% was consumed in Chile. A similar increase is expected in 1979. Improvements at the Huachipato installation included a new 4-high mill that in mid-1979 replaced the old reversing mill. The new mill will improve the yields and quality of hot and cold rolled coils, sheets, and tinplate.

In mid-1978, an important 1-year critical analysis by Japanese technicians of all the Huachipato operations with specific recommendations was under intensive review and implementing by CAP management.

Manganese.—Although production of manganese ore increased slightly, the average grade dropped from 39% to 36%. The entire production was from the Coquimbo Region. Manganesos Atacama, S.A., also produced modest tonnages of ferromanganese and manganese dioxide.

Molybdenum.—In 1978-79 Chile continued to be the world's third largest molybdenum producer and attained its highest production level in 1978. Similar levels of output from the four CODELCO mines are anticipated in 1979. Owing to major price increases in 1979, the value of Chile's molybdenum exports totaled $350 million. CODELCO's Chuquicamata and El Teniente mines contain the highest molybdenum reserves and average about 0.04% molybdenum. Chile's molybdenum is processed into molybdic oxide and ferromolybdenum and sold in this form. In the mid-1970's, CODELCO operated two molybdenite roasters with a productive capacity of about 6,000 metric tons per year of molybdic oxide. Further expansions are underway, and it was announced that a new roasting plant will be completed in 1980 at Chuquicamata.

Several foreign mining firms (Amax, Inc. and Noranda) are reportedly exploring in Chile for possible molybdenum deposits that could be mined for their own value, rather than as a byproduct of copper mining.

Precious Metals.—Most of Chile's precious metal output comes from byproducts in copper processing. In 1978, 77% of mine gold was from this source. Silver production remained at over 8 million ounces in 1978 and was expected to stay at this level in 1979. There was a substantial increase in silver from silver ores (14.6% of total in 1979 compared with 6.6% in 1978), but the increases did not compensate reduced production from both copper and lead-zinc ores.

Uranium.—Over the past several years laboratory and pilot studies have been conducted under the direction of the Chilean Nuclear Energy Commission, Comisión Chilena de Energía Nuclear (CCEN), to recover uranium from the copper leach solutions from the Exotica Mine using ion exchange methods. These tests have concluded that it is feasible to commercially recover the uranium, and consideration is now underway as to what methods to use. On September 16, 1976, the Chilean Government approved a new law, Decree Law 1557,[6] concerning the organization of CCEN and the exploration, exploitation, and processing of natural radioactive materials. This allows private firms to enter into contracts with the Commission to explore and exploit these materials. In 1975-78 the United Nations Development Program worked with the Chilean Government to explore seven areas where uranium occurrences were known. The Government of Chile reportedly feels that the country does possess considerable uranium resources. In 1979 Essex Minerals Co., a subsidiary of U.S. Steel Corp., Union Oil Co. of California, and Wyoming Mineral Corp., a subsidiary of Westinghouse Electric Corp., were reportedly discussing an operations contract with CCEN, with marketing of the yellow cake reserved to the Commission. As a part of its overall energy development program, there are provisional plans to construct a 600-megawatt nuclear powerplant by the late 1980's.

NONMETALS

Iodine.—Chile retained its role as the world's third largest iodine producer in the 1978-79 period, and output of iodine increased significantly from over 1,922 tons in 1978 to an estimated 2,300 tons in 1979. This maintained the upward trend begun in 1977 when 1,856 tons were produced. A new iodine plant is being built at María Elena which will come into production in 1980.

Lithium.—It is estimated that Chile accounts for almost half of the world's lithium reserve base. The Ministry of Mines decreed that future lithium operations will be reserved for the state. Exceptions are provided for those projects approved prior to November 1979 (Decree Law 2866) and include the Foote Mineral Co. lithium carbonate project at the Salar de Atacama. Foote Mineral has conducted feasibility studies to determine the optimum size plant needed to exploit the extensive lithium reserves contained in the potassic-rich brines of the Salar de Atacama. The studies concluded that a $23 million plant will be built with a capacity of 5,500 tons per year of lithium carbonate and 10,000 tons of magnesium oxide, generating an estimated annual sales revenue of $12 million. For this operation a joint venture has been formed between the Chilean state-owned firm Corporación de Fomento de la Produción (CORFO) and Foote Mineral. The joint venture is called Sociedad Chilena del Litio.

Nitrates.—Nitrate production continued its long-term declining trend in 1978, but recovered in 1979 to an estimated production level of 600,000 tons by the state-owned producer Sociedad Química y Minera de Chile (SOQUIMICH).

Other Nonmetals.—Alternative plans are under consideration to develop other chemicals (potassium salts and boric acid) from the extensive (3,000-square-kilometer) brines of the Salar de Atacama, which is located in northern Chile and is the largest salt deposit in the country. A $130 million plant which would produce annually 770,000 tons of potassium chloride, 250,000 tons of potassium sulfate, and 55,000 tons of boric acid appears to be the optimum choice. In June 1978 the Diamond Shamrock Corporation of Cleveland, Ohio, purchased a chlorine and soda plant at Talcahuano for $14 million from the Sociedad Petroquímica Chilena.

MINERAL FUELS

Coal.—Bituminous coal output in 1979 continued its decline to an estimated 0.9 million tons compared with production of about 1.1 million in 1978 and 1.3 million in 1977. All coal in Chile is produced by the state corporation, Empresa Nacional del Carbon S.A. (ENACAR), which took over all operations in late 1973. Chilean coal output peaked in the mid-1950's at about 2.3 million tons. The industry suffers from overemployment, very deep mines, and thin coal seams that project under the sea. In late 1978, ENACAR reportedly reduced its 14,000 plus workforce by 20% (2,800 workers) in order to place the mines on a profitable basis. Also as part of the Government plan to place the coal mining industry on a profitable basis, plans were announced to close the Schwager Mine (near Concepción) in 1980 because of declining output and high costs. Also in 1978 price controls were removed. The Government continued its feasibility studies considering possible surface mining of the large coal deposits in southern Chile in Magallanes Province. In late 1978 ENACAR announced plans for a $3 million coal exploration program which includes 38,000 meters of drilling in Arauco Province and the Lebu area.[7]

Petroleum and Natural Gas.—Petroleum consumption in 1979 was estimated at about 39 million barrels, 2.6% above that of 1978. Consumption is composed of 33% fuel oils (essentially for the mining sector), 31% fuel oils and kerosine for other industry and the domestic sector, and 26% gasoline for transportation.

Onshore petroleum production in 1978-79 continued its decline; however, Chile's offshore oil production was inititated in January 1979 from the Ostión oilfield, in November from the Spiteful field, and in December from the Posesión field, all located in the Magellan Straits. The production platforms in these fields helped raise Chile's 1979 output to almost 10 million barrels compared with 6.3 million barrels in 1978. The newly discovered offshore oilfields in the Magellan Straits of Ostión Spiteful, Anguila, Posesión, and Jaiba will be exploited and further explored from 20 drilling platforms that are being or will be built. Past expenditures for this program have been over $90 million, and another $110 to $150 million will be required for full production. In 1980 output is anticipated to reach 14 million barrels when two additional platforms come into production in the Anguila and Jaiba fields. This will be about 35% of 1980 domestic needs. By the mid-1980's domestic production may meet 60% of Chile's requirements. Further future offshore oil output is expected from Chacao Canal field near Chiloé Island presently being jointly explored by an Atlantic Richfield Co. (ARCO)-Empresa Nacional del Petróleo (ENAP) joint venture and by an ARCO-Amerada Hess Corp.-ENAP project in the Magellan area. Since the first offshore exploration contract signed with foreign companies in November 1977, two extensive offshore tracts have been explored and/or exploited. The first extends roughly south from latitude 40° S to 48° S and is being explored by ARCO and Amerada Hess. The first exploration well on this tract started in November 1979 west of Chiloé Island. The second tract is in the extreme south of Chile and covers the coastal waters from about latitude 51° 30′ S further south and eastward along the coast to almost the border with Argentina. This lease is with Amerada Hess, ARCO, and Phillips Petroleum Co.[8]

Chile also has discovered potentially important natural gas resources in the Concepción area at Isla Mocha. ENAP has concluded initial geological studies and conducted exploration drilling during 1979. Preliminary estimates indicate the gas supplies could be sufficient to satisfy the entire Concepción region's needs.[9]

In October 1978 the U.S. firms ARCO and Air Products and Chemicals Inc. signed an agreement to investigate the feasibility of exploiting and exporting natural gas from the Magallanes area. To exploit this gas, a new firm, Gas de Chile, LTDA was formed jointly by ARCO, Air Products and Chemicals Inc., Compañía Petróleos de Chile (COPEC), and ENAP. Plans and feasibility studies are underway to construct a $400 million liquid natural gas project at Cabo Negro in the Magallanes area. Current plans call for the liquefying of about 7 million cubic meters of gas daily.

Other.—In recent years Chilean scientists and engineers have been studying the country's potential for geothermal energy exploitation in northern Chile. The first commercial geothermal powerplant was approved in 1979 and is under construction about 100 kilometers east from Chuquicamata at El Tatio in El Loa Province. Plans call for an investment of $30 million with an initial installed capacity of 30,000 kilowatts and an eventual capacity of 120,000 kilowatts. It is hoped this plant will eventually satisfy all of the copper mining requirements at Chuquicamata.

Another important geothermal development underway in northern Chile is located at Puchuldiza near the Bolivian border east of Pisagua. As of mid-1979 five wells had been drilled, and the eventual power capacity of the area is estimated at 150,000 to 180,000 kilowatts. The initial power output will be 45,000 kilowatts and operation is expected to begin in 1983. Total capital investment should be in excess of $64 million.[10]

The Mineral Industry of China[1]

By K. P. Wang[2]

China's total gross national product (GNP) surpassed $425 billion in 1978, placing China solidly among the top six countries of the world. The Chinese themselves claim 569 billion Yuan (or RMB)[3] as the combined industrial and agricultural output for 1978. Per capita GNP remained very low, compared with those of western nations, but lower food, housing, and transportation costs result in a stronger economy and higher standard of living than the per capita GNP figures suggest. China's GNP has been growing at an annual rate of up to roughly 10% in recent years, although much less in 1976 when both Mao Tze-Tung and Chou En-Lai passed away from the political scene. It was officially reported that China's industrial output in 1978 was over $250 billion, or 13.5% more than in 1977.[4] Minerals and metals together contributed considerably more than 10% of China's 1978 GNP. The country's GNP in 1979 was at least $450 billion.

While 1977 was the year of return to normalcy and crusade against the "gang of four," 1978 was one of greatly improved utilization of plant capacity and unfolding of industrialization plans and modernization policies, particularly with regard to accelerating development with foreign help. China'a decision to modernize quickly had its origins in concepts initially expressed by Chou En-Lai. However, Chairman Hua Kuo-Feng made a strong affirmation of this pragmatic approach to economic development and foreign trade when he stated in mid-1978 to a National Conference on Finance and Trade in Peking that China must learn from the experience of advanced countries. China overextended its financial resources in the haste to industrialize, so 1979 became a year of consolidating enterprises, readjusting priorities, and delaying major foreign projects.

Normalization of relations between China and the United States finally was resumed on January 1, 1979, with Vice Premier Teng Hsiao-Ping visiting Washington on January 29 and the two countries exchanging ambassadors on March 1, 1979.

Production started to pick up early in 1978, generally approached known capacities by midyear, and finally established records in many instances by 1979. Major achievements announced for 1978 included the production of 31.8 million metric tons of steel, over 65 million tons of cement, 618 million tons of coal, and 48 million tons of chemical fertilizers. Output levels were clearly higher in 1979. In March 1978, Chairman Hua Kuo-Feng revealed that China had planned over 100 major projects by 1985. There was also a flurry of vaguely reported substantial geological finds, coupled with requests for foreign experts to examine them. The number of Chinese visits abroad and foreign visits to China to discuss specific projects greatly increased, especially during the second half of 1978. In midyear, the United States sent a high-level Government technical delegation to China, which no doubt will play a valuable role in facilitating future exchanges. However, after a hectic period of contract talks with foreigners, China reached a pause stage by March 1979 to review various programs. It became evident that the modernization efforts would be scaled down and the schedule moved back as much as 5 years, in line with China's financial capabilities.

China's recent disclosure that it had very extensive reserves of 17 minerals, including coal, oil, iron, copper, tungsten, tin, manganese, antimony, molybdenum, salt, magnesite, limestone, fluorspar, and phosphates, became increasingly substantiated as fragmented details of major finds were announced. The known strong position in coal was consolidated by specific mention of at least five major coal bases - Yenchou (Yanzhou) in Shandong, Kuchiao (Gujiao) in Shanxi, Huolinho in Jilin, Yiminho in Heilongjiang, and Antaipao in Shanxi. The oil outlook was much improved by various finds nearshore and offshore (from Hong Kông southwest to Tonkin), north and central China discoveries, and a very important discovery in western Xinjiang. In addition to the Anshan-Chitashan (Jidashan) iron range, another low-grade range was being developed in northern China; various 100-million-ton-plus, high-grade deposits were also reported. Development of a substantial porphyry deposit in Jiangxi proves that China indeed has much copper and molybdenum. Important porphyry molybdenum deposits have also been reported for Jilin and Shanxi Provinces. Large lead-zinc deposits were reported for Qinghai, Yunnan, and Sichuan. New primary reserves have been reported for tin and tungsten in Guangxi. China's supplies of salt, magnesite, limestone, and fluorspar are obviously substantial, and now the potentials for off-grade bauxite and phosphate rock apparently are also good. The country is very strong in rare-earth metals and seems to have some good diamond deposits as well. Recoverable helium occurs in various natural gasfields.

China has made considerable progress towards the goal of generally assessing its overall resource position within 10 years; this information is important in rational planning of industrialization programs. Much more geological surveying and mapping have been done than commonly credited by foreign technicians and observers. Although only large-scale geological maps are available outside China, most of the eastern half of the country has been mapped on a 1:200,000 or more detailed scale, and such maps are only shown to specifically interested parties. The corps of geological and drilling workers has expanded steadily in recent years, and the masses are urged to look for minerals. During 1978, China's geological workers were said to have scored significant achievements in prospecting for oil and gas, coal, high-grade iron ore, copper, tin, tungsten, potash, phosphates, pyrites, various other minerals, and ground-water resources. Geological teams of 17 provinces and political subdivisions broke with tradition and worked all winter. State targets for delineating deposits were fulfilled for 20 major minerals during 1978 and 1979. Large reserves of coal, iron ore, copper, chrome, manganese, tungsten, and pyrites were found. New deposits of 17 lesser minerals, including rutile and fluorspar, were also discovered. Because of successful geological surveys done in areas outside of known ore horizons and major regions, an additional 100 new deposits were reportedly found.

The State Geology Bureau, which became the Ministry of Geology in late 1979 and was scheduled to participate in a technical cooperation project with the U.S. Geological Survey, convened an important geological conference in Shanghai in early 1978, with the objective of identifying sufficient minerals for China's modernization efforts. The conference concluded that China has a bright future even in high-grade iron ore, and that the targets for the number of discoveries should be increased. It further recommended that a special geological and drilling effort should be made to provide data for building 10 "Tachings" or (Daqings). The hope is to find many more coalfields in south China and more underground water resources in drought areas. To step up exploration, new techniques should be utilized to a greater extent, such as aerial surveying, remote sensing, and joint use of geophysical and geochemical exploration concepts. General exploration should be coordinated with detailed investigations. Geological research needs to be stressed, and an effort should be made to develop new technology while improving known practices, according to the State Geology Bureau.

Specifically, many iron deposits were discovered in Yunnan, Sichuan, and Tqinghai Provinces, where the ore is of high grade and the strata are thick and, therefore, worthy of further investigation. Rich oil deposits were found in Jiangsu and Guangdong Provinces, and a number of new coalfields were discovered in Jiangxi, Fujian, Hunan, Hubei, and Guangxi Provinces. The State Geology Bureau further reports that new phosphate horizons occur in places like Inner Mongolia and Liaoning that warranted additional prospecting. Underground water was found in arid and semiarid areas of northern China. Good progress was made in the search of complex deposits of nonferrous metals in the southwest. China's saline lakes (many dry ones) were carefully examined. It was also reported that Weisancheng in Henan Province, with high-grade ores, was China's foremost silver mine.

During 1978 and early 1979, the following very important mineral discoveries were disclosed by the Chinese: A large tin (also lead-zinc and antimony) mining district in Guangxi, probably near Hochih; a rich tungsten deposit also in Guangxi; three major lead-zinc deposits in Qinghai (Sitiehshan), Gansu (Chengxian), and Sichuan; extensive porphyry copper deposits in eastern Tibet (Yulung-Qamda) and Yuanqu in Shanxi; a cobalt-copper deposit on Hainan Island; a tungsten deposit at Chengxian in Hunan; a very large nickel-copper deposit at Jinchuan in western Gansu; chrome ore associated with platinum in Yunnan and Tibet; and extensive lithium-boron resources in the salt lakes of Tibet.

Of particular interest is a report[5] that a very extensive multiple metals province had been found in the Chinsa-Lanchang-Nuchiang Rivers area straddling Qinghai, Tibet, Yunnan, and Sichuan Provinces. This mineralized area covers 550,000 square kilometers and is 1,900 kilometers from north to south. Geologically located at the intersection of the Indian and Asian tectonic plates, it has undergone various violent structural changes that have developed many mineral concentrations. Reportedly, more than a decade of geological investigations have proven that the area's potential is very good for numerous minerals, including iron, copper, lead, zinc, tin, antimony, mercury, tungsten, molybdenum, rare-earth metals, nickel, platinum, pyrites, potash, mica, asbestos, gypsum, magnesite, and limestone; water, forest, and geothermal resources are also said to be rich. Specific deposits already discovered in this region include a large copper deposit in the Yulung area of Tibet, a very large lead-zinc deposit in the Lanping area of Yunnan, a platinum-palladium deposit in the Mitu, Chinpaoshan (Jinbaoshan) area of Yunnan, and a potash deposit in the Chiangcheng area of Yunnan. Iron and tin are said to be mainly in the south, copper occurs in four parallel belts, and lead-zinc is widely distributed.

Mineral deposits discovered and delineated by the State Geology Bureau (subsequently, the Ministry of Geology) are turned over to the various concerned ministries for production, particularly to the Ministries of Petroleum, Coal Industry, Metallurgical Industry, Chemical Industry, and Construction Materials, which control all the major mineral, fuel, and metal-producing combines of China. In the past, most large projects were developed and operated by these domestic combines, and China's own efforts to industrialize have met with reasonable success across the board. In the latter part of 1978, however, China suddenly started to negotiate many substantial agreements with foreigners to help develop basic industries. This was, in turn, followed by a drastic cutback and delay in the foreign projects.

West German firms have been awarded contracts to develop a 20-million-ton-per-year lignite mine complex in Jilin and six shaft mines in Hebei and Anhui with a combined capacity of 20 to 25 million tons per year of coal, and were also bidding on another low-rank coal mine in Heilongjiang (also 20 million tons per year), possibly against U.S. firms. U.S. firms were also in the running to develop a 20-million-ton-per-year opencut "hard" coal mine complex in Shanxi. The Japanese will definitely be involved in some of the mines in the Yenchou or Yanzhou coalfields of Shandong and the Kuchio or Gujiao coalfields of Shanxi, both of which are to be built up into very large coal bases. It is quite possible that other foreigners will be involved in these two fields also. The Japanese may help develop mines in Hebei and Liaoning as well. British companies have been contracted to help develop two major coal mines in Tatung (Datung), Shanxi, partly to supply a new powerplant to be built in Hong Kong.

In late January 1979, it was reported that China was negotiating with Japanese and U.S. firms for joint development of a newly discovered western Xinjiang oilfield at an initial cost of $1 billion. The news has great uncertainties and vast implications, since this field is thought to be larger than Taching (Daqing) or Shengli (Xengli), and the oil is light rather than waxy. About nine U.S. oil companies were interested in China's offshore oil (and nearshore oil), mainly in the South China Seas but also further north in the East China Seas. Oil has already been found in the Pearl River estuary near Canton, the Leichow Peninsula, the Chiungchow Straits north of Hainan Island, and offshore southwest Hainan in the Tonkin Bay. Various exploration contracts were signed in 1979 with U.S. firms to work some of the above areas offshore. The Japanese were angling to obtain the rights to develop the Samsui oilfield near Canton, as well as the Bohai Bay in the north. British Petroleum will conduct a seismic survey of the Southern Yellow Sea.

In iron and steel, the Shanghai Paoshan or Baoshan project, nurtured by Nippon Steel, is leading the way. The first two stages call for production of 6 million tons per year of steel, with most of the iron ore coming from foreign sources initially. Anshan's capacity is to be more than doubled to about 15 million tons per year eventually. United States Steel got the bid to modernize and expand Chitashan (Jidashan)-Anshan's largest future ore source- to 17 million tons per year of pellets (plus some sinter). At another large proposed steelworks in the north called Chitung (Jidong), West German and Japanese companies, and very likely United States Steel, have been asked to submit bids. Chitung, which is at least the size of the Shanghai steel project, apparently will not be built until after 1985. Nevertheless, Kaiser Engineers was helping to develop the Szechiaying mine for Chitung. Japan's Nippon Kokan seems to have the best chance to work on expanding the Peking Steelworks, and Bethlehem Steel got the job to build up the Shuichang iron mine which supplies the present steelmaking facilities. Wuhan Steelworks, which has gotten help from the Federal Republic of Germany and Japan in the past, is planning to expand further. Foreign companies, particularly the Japanese, have been actively seeking to help construct various other steelworks.

In nonferrous metals, Fluor Corp. was awarded a contract to build a very large copper mine plant in Jiangxi Province on a cost-plus basis. When the 250,000-ton-per-year copper mine (which may be scaled down 20%) is finished, additional smelting capacity will be required; as of early 1979, Sumitomo Metal Mining had been awarded a contract to build a 90,000-ton-per-year copper smelter in Jiangxi. Nippon Light Metals will soon start on construction of an 80,000-ton-per-year aluminum reduction plant in Guizhou Province, and the Aluminum Company of America (ALCOA) was asked to submit bids on two other aluminum plants. Reynolds Aluminum and Kaiser Aluminum have also been invited to submit bids on developing additional deposits and facilities. The Chinese have requested Japan's Mitsubishi Metal Corp. to assist in the development of the lead-zinc industries as a whole; negotiations were also in progress with Toho Zinc to build a 100,000-ton-per-year zinc refinery. Metallgesellschaft AG and Lurgi have a long-term contract to help develop the nonferrous metals industries, including work on 22 plants around the country. French firms may help to assess tungsten resources.

In nonmetallics and energy, the Chinese sent inquiries to four Japanese firms about building at least one new cement work, with Kawasaki Heavy Industries having the best chance; also, Nippon Cement Co. won a contract to help modernize existing cement plants with suspension preheaters. A U.S. mining design company apparently is helping China to develop a major pyrite project near the Samsui oilfield in Guangdong Province. A large phosphoric acid plant has been bought from the United States, and U.S. phosphate experts have been asked to visit China, portending cooperative efforts in the future. The Chinese were seeking help from the Japanese in solar and geothermal energy, as well as hydropower and energy research. French firms were scheduled to sell U.S.-designed nuclear powerplants to China.

In late 1979, China's electric power capacity registered more than 50 million kilowatts (roughly one-eighth of that of the United States), and power output in 1978 was reported at 257 billion kilowatt-hours. A major thrust is being made to build up this vital industry, both large and small plants. The Chinese probably were thinking in terms of topping well over 100 million kilowatts by the mid-1980's. In 1979, hydropower accounted for approximately one-third of total electric power capacity and closer to one-fourth in terms of power generation, because of the intermittent nature of power from water resources. Hydropower was scheduled to be pushed, which is understandable since China's water resources may be the largest in the world. Three-fourths of the thermal electric power was derived from coal, and the rest mainly from oil and gas. Some of the large thermal plants completed recently include the ones within the properties of the Huainan and Huaipei coal combines in Anhui and the Tzupo coal combine in Shandong. China has extensive resources of all kinds of energy substances so that an enlightened program of development should make available adequate fuels and power for the country's industrialization needs. Coal will receive particular emphasis as a fuel in thermal power generation, but more natural gas will be utilized also. China at first decided to build nuclear powerplants quickly, but this program has been shelved indefinitely.

In the spring of 1978, China announced its initial program of developing basic industries during the next 8 years, along with other targets of the economy. The originally stated goal was to build or complete 120 large-scale projects, including 10 iron and steel complexes, 9 nonferrous metal complexes, 8 coal mining bases, 10 "Tachings" or oil and gasfields, 30 power stations, 6 new trunk railways, and 5 key harbors. The completion of these new projects, added to the existing facilities, was expected to provide China with 14 fairly strong and rationally located industrial bases that could be decisive in changing the backward nature of basic industries.

In March 1979, an editorial in the People's Daily (Renmin Ribao or Jen-Min Jih-Pao) called for reordering priorities in China's modernization program in favor of agricultural development and growth of light industry rather than of heavy industry. Some projects were to be scrapped or slowed down while proposals for new projects were to be strictly limited to avoid overextending the country's financial resources. Development of the steel industry was originally planned to be one of the cornerstones of the modernization program. However, the People's Daily indicated that the plans to double the 1978 production level by 1985 were overly ambitious. To this view, development of iron mines, new steel plants, and expansion projects could be affected and very likely delayed.

Nonetheless, a special effort will be made in the development of the power, fuel, and materials industries, along with transport and communications. In particular, the work in geological surveying, mine development, and construction will be stressed. Agriculture is, of course, also fundamental, and as much mechanization as possible will be introduced, along with the application and development of fertilizers. Agricultural products will be coordinated with petrochemically produced raw materials to meet the needs of light industry. The machine building industry will be coordinated and made more diversified, and the defense industries will be built up to serve both military and civilian purposes. Foreign trade will be expanded, both in terms of volume and types of industrial, mineral, agricultural, and other products, and in terms of purchasing raw materials, expertise and services, and industrial plants.

A few specific 1985 targets were announced, and some others might be surmised. China's original goal was to produce 60 million metric tons per year of steel by 1985, nearly twice the 1978 Chinese level and roughly half the U.S. output; most new capacity will come from plants to be built or expanded with foreign help. The steel target was subsequently revised downward to 45 to 50 million tons. The target for coal was approximately 800 to 900 million tons per year or one and a half times the 1977 level. (Chinese coal output is of the same magnitude as the United States.) The Chinese seem to be assured of 150 million tons per year of oil by 1985 - one-third of U.S. output - and could reach 200 million tons per year by 1990, depending on when new major fields come onstream. Cement production was well on its way towards reaching 85 to 90 million tons per year by 1985, surpassing what is presently produced in either the United States or Japan. The Chinese no doubt expect to more than double production of chemical fertilizers between 1977 and 1985, with many ultramodern plants to be placed in full-scale operation.

During the next 6 or 7 years, China hopes to bring up nonferrous base metal production from fairly low levels to medium-high by world standards. An effort will be made to produce larger quantities of the so-called export metals, as well as supply growing domestic needs. The small- and medium-enterprise sector, which is very important in China, will be built up accordingly. Expansion programs in power and transport, which are basic to development of natural resources, are also rather ambitious. The many projects underway or being planned indicate that most targets will eventually be achieved, perhaps up to 5 years behind schedule. In evaluating Chinese performance, it should be remembered that figures must be discounted somewhat to allow for quality problems and the small mine-plant sector.

PRODUCTION

Industrial production value in 1979 was 8% more than that in 1978, which, in turn, showed an increase of 13.5% over the 1977 value. There were many reports on production increases by individual enterprises, and China's State Statistical Bureau came out for the first time with 1977 and 1978 national output figures for many major industrial products showing the same upward trend. Corresponding data for 1979 are not yet available, although output of some major products were mentioned in the press. For 1978, production of 47 of the 80 major industrial products met targets at least 1 month ahead of schedule, including steel, pig iron, rolled steel, copper, coal, cement, and chemical fertilizers. Also production of nearly all 80 industrial products had increased considerably, with more than 50 products increasing in excess of 20% over the 1977 levels.

Coal production in 1978 was 12.4% more than that given for 1977, and crude oil production, 11.1% more. In contrast, gains in coal and oil in 1979 (over 1978) were only 1.6% and 1.9%, respectively. Efforts to improve efficiency and catch up on development were reasons for slower growth. Electric power production was 14.8% more than the 223 billion kilowatt-hours given for 1977. The performance of the steel industry in 1978 and 1979 was outstanding, with ingot and rolled steel outputs rising roughly 50% each in 2 years. In this instance, most idle steel capacity became more fully utilized. Cement production increased perhaps 10% and reportedly 17.5% in 1979 and 1978, respectively, over the previous years, with small-scale cement plants spearheading the way. In 1978, China was said to have produced 6.6 million tons of sulfuric acid, 1.33 million tons of soda ash, and 1.64 million tons of caustic soda. One major surprise in the reported output figures is salt, which was given as 17.1 million tons in 1977 and 19.5 million tons in 1978 - considerably lower than what western observers had thought. However, the salt figures very likely are incomplete and exclude the salts converted to industrial chemicals.

Production of other minerals and metals must be estimated because official data are not released. Natural gas output may be in the range of up to 100 billion cubic meters per year. Since the bulk of the pig iron is produced from iron ore, China's iron ore production of equivalent 50% Fe or better grade is rather high compared with other countries. China produces mostly direct-shipping iron ore, concentrates, and sintered ore rather than pellets. The Chinese report combined production of more than 1 million tons of copper, tungsten, tin, aluminum, lead, zinc, and two other nonferrous metals in 1979, or 12.8% more than in 1978.[6] This means mainly the combined output of the nonferrous base metals (refined)—copper, lead, zinc, and aluminum—since the others are no doubt small in quantity. China's production of the major nonferrous base metals is not significant by world standards. However, in basic materials, China is indeed important, ranking second in salt, third in coal, fourth in cement, fifth in steel, and within the first 10 in oil. China is one of the world's foremost producers of pyrite, and a medium large producer of phosphates. The country leads the world in tungsten, among the top three producers of antimony, and ranks closer to fifth in tin. Resources of these and other export metals look better as the years go by.

Table 1.—China: Estimated[1] production of mineral commodities

[7]Series revised to correlate with reported figure for 1978.

TRADE

China's exports and imports totaled 45,300 million yuan last year, 29.2% higher than in 1978, the Ministry of Foreign Trade reported. Exports, led by a strong increase in the sale of heavy industrial goods, totaled 21,200 million yuan, an increase of 26.6%. Imports totaled 24,100 million yuan, an increase of 31.6%. The rise in sale of heavy industrial goods over 1978 was 59%, which accounted for 32.1% of the total increase in exports. Items included petroleum, hardware, chemicals, minerals, machinery, and equipment. Export of light industrial goods increased by 23.2%, and agricultural and sideline produce rose 1.9%. Because of the rise in the sale of heavy industrial goods, however, the proportion of agricultural products to the total export value decreased. Among imports, new technologies and complete plants went up 190% over 1978, accounting for 14.7% of the total. Consumer goods rose 40%. Materials for agricultural use increased by 18.4%, and raw materials for light industry, 12.9%. Meanwhile, the Ministry reported, imports of rolled steel, aluminum, pig iron, and iron ore were reduced. To increase its foreign trade, China built export commodity centers, plants, and workshops and has tapped increasing numbers of resources for possible export. In 1979, the value of all industrial, agricultural, and other goods purchased for export ran to 29,600 million yuan, a rise of 32% over the previous year.[7]

With a headstart, Japan developed $5 billion worth of annual trade with China in a little over 5 years. Japan's two-way trade with China in 1978 reached $5.08 billion, with Japanese exports to China worth $3.05 billion and Japanese imports from China worth $2.03 billion. Machinery shipments to China trebled the 1977 level, and steel shipments in 1978 surpassed 5 million tons. To assure steel supplies needed for construction, Japanese steelmakers have signed a 3-year pact to furnish China with a total of 15 million tons. Chinese demand for seamless pipes for oil distribution is so strong that the country was considering investing in additional pipemaking facilities within Japan. Considerable quantities of Japanese fertilizers go to China, although their combined value is not great. China's most important single export item to Japan in 1978 continued to be petroleum, valued at roughly $900 million. Japanese exports to China rose 21.3% over 1978 despite a sharp drop in steel shipments, whereas Japanese imports from China increased 45.5%, mainly because of the spectacular growth in fuel prices.

China's trade with other countries was also on the rise. In early 1978, a general trade pact was signed with the European Community countries to expand trade and afford China favorable treatment. As a result, two-way trade with Western Europe increased at least $1 billion in 1979 over the $2.5 billion figure in 1978. The British and the Chinese agreed in principle to sharply boost bilateral trade from the current level of $400 million per year to $10 billion by 1985, and signed a nonferrous metals trading agreement on January 30, 1979, which related not only to marketing but possibly also to mineral development in the future.[8] China and France signed a 7-year trade agreement of almost $14 billion. The Federal Republic of Germany concentrated on trying to sell metal plants, chemical facilities, and coal mine development in substantial deals. Various industrial and trade agreements involve Great Britain, China, and Hong Kong. China may have earned as much as $2 billion from its exports to Hong Kong during 1978 and $2.4 billion in the first 10 months of 1979. Two-way U.S.-China trade was over $1.1 billion in 1978, and over $2 billion in 1979. This trade can further blossom under the right conditions, but developing specific exports to the United States may be difficult. So far, China has been paying for the technical services rendered by U.S. firms mainly by cash, but credits and payments in kind may come into play.

Table 2.—China: Apparent exports of selected mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977[2]	1978[3]	Principal destinations, 1978

Commodity	1977[2]	1978[3]	Principal destinations, 1978
METALS —Continued			
Antimony:			
Ore and concentrate	[4]1,248	249	Spain 141; Japan 46; United States 37.
Metal and regulus	[4]1,133	4,793	United States 1,924; Japan 1,578; France 601.
Arsenic:			
Natural sulfides	25	10	All to Japan.
Trioxide	853	253	Japan 215.
Chromium:			
Chromite	NA	80	All to Thailand.[5]
Oxide and hydroxide	--	40	All to Singapore.[5]
Copper:			
Sulfate	[4]200	105	All to Japan.
Metal including alloys:			
Unwrought	--	455	Belgium-Luxembourg 350;[5] Thailand 100.
Semimanufactures	842	1,495	Hong Kong 1,096; Thailand 281.
Iron and steel:			
Ore and concentrate	--	38	All to United States.
Metal:			
Scrap	--	177	Japan 172.
Pig iron	3,228	6,475	Hong Kong 3,775; Singapore 2,700.
Ferroalloys	904	277	Sweden 177;[5] Yugoslavia 85.
Semimanufactures thousand tons	63	187	Hong Kong 148; Singapore 14.
Lead:			
Ore and concentrate	--	1,500	All to Yugoslavia.
Oxide	125	403	Indonesia 135;[5] Hong Kong 95; Singapore 55.
Metal including alloys, semimanufactures	--	138	Egypt 128.
Magnesium metal, all forms	--	1	All to Ireland.[5]
Manganese:			
Ore and concentrate	52,117	[5]46,346	Japan 42,661; West Germany 2,357.
Oxide	251	1,609	Finland 1,020; Hong Kong 369.
Metal, all forms	--	25	All to Netherlands.
Mercury 76-pound flasks	4,099	6,313	United States 3,328; Hong Kong 1,230.
Molybdenum ore and concentrate	--	60	All to Japan.
Nickel metal including alloys, semimanufactures	--	4	Sudan 3.
Silver, unworked or partly worked value, thousands	--	[5]$4	Canada $2; Switzerland $1.
Tin metal including alloys:			
Unwrought	2,878	5,060	Yugoslavia 1,779; United States 1,571; [6] Netherlands 738.
Semimanufactures	15	108	Hong Kong 95.
Titanium:			
Ore and concentrate	--	569	All to United States.
Oxides	1,402	1,225	Japan 415; Hong Kong 330; France 301.
Tungsten:			
Ore and concentrate	2,655	3,227	Austria 1,133;[5] West Germany 1,009.
Metal, all forms	12	7	All to Yugoslavia.
Zinc:			
Oxide	150	914	Hong Kong 369; Japan 289.
Metal including alloys:			
Unwrought	4,508	9,120	Thailand 2,954; Hong Kong 2,941; Japan 1,990.
Semimanufactures	--	28	Hong Kong 26.
Zirconium ore and concentrate	9	10	All to Japan.
Other:			
Ores and concentrates	2,327	2,455	Egypt 1,000; Thailand 620; Singapore 296.
Ash and residue, nonferrous	302	427	Hong Kong 400.
Oxides, hydroxides, peroxides	216	295	Japan 80; Hong Kong 70.
Metals:			
Metalloids	15	16	Kenya 8; Denmark 5.
Base metals, including alloys all forms, n.e.s	2,916	1,724	Singapore 263; Japan 260; Hong Kong 234; West Germany 231.[5]
NONMETALS			
Abrasives:			
Pumice, emery, natural corundum	445	325	All to Japan.
Grinding and polishing stones	317	662	Hong Kong 458; Indonesia 138.[5]
Asbestos	3,671	6,026	Indonesia 2,440;[5] Thailand 1,199; Japan 940.
Barite and witherite	27,837	106,157	West Germany 61,577; Netherlands 24,331; Japan 16,966.
Boron oxide and acid	395	141	Japan 107.
Cement thousand tons	418	718	Hong Kong 716.
Chalk	--	30	All to Singapore.

See footnotes at end of table.

Commodity	1977[2]	1978[3]	Principal destinations, 1978
NONMETALS —Continued			
Clays and clay products:			
Crude	68,615	84,484	Japan 59,522; Italy 8,684;[5] Hong Kong 6,010.[5]
Products:			
Refractory	NA	6,210	Singapore 3,988; Indonesia 1,921.[5]
Nonrefractory	21,973	23,544	Hong Kong 19,728.
Cryolite and chiolite, natural	200	433	All to United States.
Diamond:			
Gem, not set or strung value, thousands	$972	[5]$2,002	Japan $1,242; Hong Kong $311; Belgium-Luxembourg $227.
Industrial do	$1,105	[5]$1,035	All to Belgium-Luxembourg.
Diatomite and other infusorial earth	--	11	All to Sweden.[5]
Feldspar and fluorspar	141,639	170,383	Japan 155,770.
Fertilizer materials:			
Crude:			
Nitrogenous	NA	[5]480	Belgium-Luxembourg 240; Indonesia 240.
Phosphatic	NA	115	All to Singapore.
Manufactured, including mixed	33	10	All to Hong Kong.
Ammonia	--	12	Indonesia 10.[5]
Graphite, natural	13,335	12,237	West Germany 3,968; United States 2,763; Japan 1,933.
Gypsum and plasters	1,710	3,420	Hong Kong 1,763; Indonesia 885;[5] Singapore 682.
Lime	41,618	29,148	Hong Kong 28,979.
Magnesite	47,290	59,893	Japan 21,116; West Germany 13,913.
Mica, all forms	4,172	5,597	United Kingdom 4,112; West Germany 900.
Pigments, mineral:			
Natural, crude	1,103	2,661	Japan 1,098; Hungary 628; Indonesia 585.[5]
Iron oxides, processed	423	2,599	Indonesia 579;[5] Singapore 539; Hong Kong 483.
Precious and semiprecious stones value, thousands	$2,554	$5,795	Hong Kong $2,999;[5] United States $1,135; Japan $1,120.[5]
Salt	24,727	165,286	Japan 137,610; Hong Kong 27,592.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	5,145	15,656	Hong Kong 9,653; Egypt 5,137.
Caustic potash	NA	18	All to Indonesia.[5]
Soda ash	2,126	4,100	Hong Kong 3,069; Indonesia 563.[5]
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	19,457	35,586	Japan 32,999.
Worked	5,758	18,115	Hong Kong 8,005; Singapore 3,145; Indonesia 3,075.[5]
Gravel and crushed rock	18,594	58,159	Hong Kong 53,769.
Limestone	6,328	23,353	All to Hong Kong.
Quartz and quartzite	13,279	25,666	Japan 15,471; Hong Kong 10,142.[5]
Sand	789,902	990,772	Hong Kong 990,771.
Sulfur:			
Elemental	NA	28	Singapore 25.
Sulfuric acid	47	99	All to Hong Kong.
Talc	209,218	291,580	Japan 246,639; United Kingdom 8,744.
Other:			
Crude	7,960	10,114	Hong Kong 5,850; Japan 1,195.
Slag, dross, other waste	4,100	22,846	Japan 21,600.
Oxides of magnesium, strontium, barium	2,307	165	Finland 120.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	[4]1	155	All to Thailand.
Coal:			
Anthracite and bituminous coal thousand tons	494	797	Japan 772.
Briquets of anthracite and bituminous coal do	141	NA	
Lignite and lignite briquets	100	1,219	All to Japan.
Petroleum:			
Crude thousand 42-gallon barrels	48,497	59,030	Japan 54,772; Thailand 3,395.
Refinery products:			
Gasoline do	40	[5]159	All to Hong Kong.
Kerosine and jet fuel do	1,557	[5]1,902	Do.
Distillate fuel oil do	14	[5]6,658	Hong Kong 6,088.
Residual fuel oil do	6	[5]1,672	Hong Kong 1,671.
Lubricants do	42	[5]75	Hong Kong 69.
Other:			
Mineral jelly and wax do	623	[5]166	Hong Kong 90; Thailand 34.
Nonlubricating oils do	NA	[5]31	Indonesia 30.
Petroleum coke do	789	[5]979	All to Japan.

COMMODITY REVIEW

METALS

Aluminum.—China's aluminum consumption has clearly risen to 400,000 to 500,000 tons per year, with two-thirds derived from domestic output and the rest from imports. Because China is far behind world levels in aluminum use, serious efforts are being made to build new plants, acquire foreign knowhow, and develop indigenous resources. Meanwhile, large-scale imports probably will be continued (maximum of more than 300,000 tons per year in 1975), mainly in the form of metal or alumina rather that bauxite. Since production of aluminum by the Hall Process requires 15,000 to 20,000 kilowatt-hours of electricity per ton, cheap and dependable power is a prerequisite, commonly either hydropower or power from natural gas. There should be little difficulty with the local supply of chemicals, although more chemicals are required to digest Chinese aluminum raw materials.

The first specific new foreign aluminum project is a $260 million, 169,000-ampere, 80,000-ton-per-year prebaking type of reduction plant, to be built at Guiyang, Guizhou Province, by Nippon Light Metal Co., an affiliate of Canada's ALCAN. The contract, signed January 7, 1979, stipulates startup by March 1981 and full-scale operation within a year thereafter.[9] Anticipating this development, Nippon had trained nine Chinese engineers at its Niigata plant during the previous summer. Serious talks had also been made with Sumitomo Aluminium and Showa Denko, suggesting that obtaining Japanese help in constructing another plant of this size is possible.

ALCOA has talked with the Chinese on several occasions about developing the aluminum industry. In late January 1979, a letter of intent was signed with ALCOA to conduct feasibility studies for the construction of two very large integrated aluminum plants in China. Kaiser Aluminum and Reynolds Aluminum were asked to visit China in early 1979. Alsar-Alumetal SpA of Italy may supply China with aluminum and technology, and Pechiney and Alusuisse have maintained contact with the Chinese throughout recent years. Overall, the Chinese probably are planning to develop about 1 million tons per year of capacity in a decade; most of this must be built with foreign help. The first major project may be located in southern Guangxi, to utilize local ores.

The only sizable aluminum reduction plant known to be in existence in China is Fushun in the northeast, rated at about 100,000 tons per year. This plant has horizontal stud Soderberg cells of 450 kilograms per day, erected in two workshops, each with two potlines of 160 cells apiece. Nating in Changtien, Shandong, with four big rotary kilns houses China's largest alumina plant. There is a sizable alumina—aluminum complex, in Zhengzhou, Henan. The Shanmen Gorge plant on the Henan-Shanxi border and the Yiliang plant located 80 kilometers southeast of Kunming have two potlines each and may be up to 30,000 tons per year in capacity. Other plausible plant locations are Lanzhou in Gansu, Taiyuan in Shanxi, Wuhan in Hubeh, Changling in Julin, Qingtas in Shandong, Chengdu in Sichuan, Hefei in Anhui, and Baotou in Inner Mongolia, all of which are probably rather small aluminum plants.

China seems to have extensive resources of aluminum raw materials, which a Hungarian authority estimates at possibly 1.2 billions tons.[10] Thus, workable reserves could amount to a few hundred million tons. An Australian geologist, Ikonikov, makes the following five generalizations on Chinese bauxites: All known deposits are of platform origin; deposits are mainly carboniferous and secondarily Permian; diaspore is the main ore mineral; Chinese bauxites contain recoverable gallium, germanium, and sometimes uranium; and the aluminum materials, while low in iron, are high in silica, requiring more chemicals to clean. China also has several types of alunite and aluminous shales. Much recent exploration has been done with good results.

A large, high-grade bauxite deposit has been reported in Pingguo County in Guangxi Province and is capable of supporting a major aluminum center.[11] Exploration in Pingguo began in 1972; to date, 4,500 shallow pits have been dug and 34,000 meters of tunneling have been driven. The very high grade (59.9% Al_2O_3), secondary type of bedded ore occurs very near the surface along the banks of the Yujiang River. At least one U.S. aluminum company has been asked to evaluate this deposit, in terms of eventually building reduction facilities to utilize the ores.

Antimony.—Along with the Republic of South Africa and Bolivia, China is one of the big three world producers of antimony. However, the 10,000 to 13,000 tons of antimony produced annually by China (one-half exported) does not provide too much foreign exchange because of the limited tonnages and moderate prices. In January 1979, the price of antimony was only about $1.30 per pound, and the Chinese were trying to hold back for better prices. In the last few years, more metal has been exported at the expense of concentrates. Japan, traditionally a large buyer, imported 1,133 tons of metal in 1977 and 640 tons in the first half of 1978, but only a trickle of Chinese antimony ore for 1978 overall. Antimony reserves have long been acknowledged as very large by world standards, and production could be raised as needed in China's modernization program. How much China is to export is purely a policy decision. Hsikwangshan or Xikuangshan and nearby areas in southwestern Hunan Province have long been China's main antimony-producing districts. Guangdong Province ranks a distant second in potential and output. Antimony technology is well advanced in China, from mining and beneficiation to making metal, oxides, and sulfides. The three leading world producers last met in La Paz, Bolivia, in 1975.

Cobalt.—Cobalt in China has been mentioned in three connections recently. The nickel sulfide deposit (see "Nickel" section) may have a cobalt reserve of more than 100,000 tons or 2% of the known nickel reserves. However, because of the low grade, perhaps only half of this is recoverable. The Jinchuan nickel mine in Gansu, which can be greatly expanded in the future, possibly furnishes 100 tons of contained cobalt annually at present. A large complex metal deposit in Southwest Yunnan Province, within the Dahungshan District, has cobalt in the ores, along with copper, iron, and precious metals. A 1-billion-ton titaniferous magnetite deposit in Szechuan has cobalt in the ores, along with vanadium, nickel, chromium, and gallium. A cobalt deposit with copper values has been reports for Hainan Island. Thus, China may be moderately endowed with the strategic metal cobalt.

Copper.—China has the capacity to produce about 300,000 tons per year of refined copper, and it imports 150,000 to 200,000 tons per year of copper in all forms. In early December 1978, Sumitomo Metal Mining Co. was awarded a $117 million contract to build an integrated copper smelter (probably Flash smelter) in Guixi, Jiangxi Province, southern China, rated at 90,000 tons per year of refined copper plus 360,000 tons per year of sulfuric acid.[12] China has only two nonferrous smelters (with important copper units——about 50,000-ton-per-year size) that might be classified as medium in size by world standards, Shanghai and Shenyang in Liaoning. There are no large ones. Kunming in Yunnan, Paiyin in Gansu, Tongling in Anhui, and Dayeh in Hubei have 30,000- to 40,000-ton-per-year copper smelters or refineries. Small copper facilities have also been mentioned for Lanshou, Urumchi, Taiyuan, Peking, and Hainan Island. Late in 1978, two West German firms, Metallgesellschaft AG and Lurgi Gesellschaft, were awarded a contract to supply 22 plants for China's nonferrous metals industry.

China seems to have adequate copper resources for meeting its expanding industrial needs, although production is small at the moment. A recent Fluor Corp. contract revealed that an extensive porphyry deposit exists in Jianxi Province capable of supporting an open pit operation with a daily output of 175,000 tons of 0.5% copper ore. In fact, a multimillion dollar, 4-stage contract signed with this U.S. firm initially called for building a roughly 250,000-ton-per-year copper mine plant near Tien Pan Chieh, in the Tehsing (Dexing) area, scheduled for completion by 1983. Such a project would be bigger than any single one in Chile in terms of ore output. However, the project was subsequently scaled down about 20% and moved back roughly 2 years. Tehsing copper ores have good values in molybdenum, precious metals, and rhenium. Reserves so far determined amount to about 8 million tons of contained copper. There are already three mines in Tehsing, namely Tungchang, Fuchiawu, and Chuhahung.

The British have reported that three substantial copper porphyry ore bodies at Yuanqu, Shansi Province, will be developed or expanded; one of these is already worked fairly efficiently, yielding 4,000 tons per day of ore. Chinese news releases in mid-February 1979 mention that a large porphyry copper deposit had been found in Qamdo Prefecture, eastern Tibet, with more than 7 million tons of copper reserves close to the surface. A large ultramafic nickel-copper sulfide deposit, in part minable by open cut methods, has been reported in Jinchuan in western Gansu (see below under "Nickel");

in fact, a medium-size mine is already in operation.

China also has extensive and high-grade skarn copper deposits in the middle and lower regions of the Yangtze River and many other areas. Its better known copper mines include Hungdoushan, north of Fuschun, Huadong at Chingyuan, Tunghua in Jilin, and Tungguanshan in Anhui. None are large. For example, Hungdoushan which produces 2,000 to 3,000 tons per day of ore containing 1.5% copper and 1% zinc. The medium-size Tungchuan underground copper mine in Yunnan Province has been rejuvenated. A large copper-iron deposit with cobalt and precious metal values was discovered recently in the Dahungshan area of Yunnan. The March 1978 issue of China Pictorial showed a photograph of another medium-size copper mine, in the Fenghuang Hills of Tung-ling Hsien, Anhui Province. A copper mine near Dayeh (Tayeh), Hubei, was producing about 3,000 tons of 1% copper ore per day.

While carrying out the program to acquire foreign smelters and develop domestic mines, China was also continuing its efforts to import whatever copper is necessary. An agreement was signed with Chile in October 1978 to supply China with 30,000 tons per year of copper over 3 years. For helping develop the Tintaya mine in Peru, China was scheduled to be repaid with about 40,000 tons of copper annually plus 10,000 tons each of lead and zinc. Although the Chinese were hoping to get steady if not expanded supplies of copper (up to 50,000 tons per year) from Africa through construction of the 1,100-mile Tanzam Railway, political instability there may work against this. A 3-year contract was signed with Papua's Bougainville management in March 1978 to supply China with 20,000 to 22,000 tons of copper concentrates annually. A contract with the Philippines, agreed upon in November 1978, called for 60,000 tons per year of concentrates, basically to be bartered for Chinese oil on a long-term basis. China received about 32,000 tons of the Philippines copper concentrates in 1976 and 67,000 tons in 1977. China has had a commercial problem with Philippine copper concentrates containing high gold values, and the Philippines will have difficulty supplying China unless new mines are developed.

Gold and Silver.—China has never been important as a gold or silver producer, although the potential might be there, especially under high-price conditions. However, there have been great accumulations of both metals since time immemorial from local ores and placers plus imports of metals. The gold picture is brighter, as many rivers in Heilongjiang, Jilin, and Sichuan already together yield 100,000 to 200,000 ounces of placer gold per year. Sinkiang or Xinjiang seems to have both placers and lode mines. In fact, gold activity has been reported in widely scattered areas of the country, including Hunan, Guangxi, Henan, Shandong, and Zhejiang. If enough large copper mines are eventually developed, byproduct gold should be of consequence too. When China was on the silver standard, much silver was imported from Mexico in the early part of the 20th century. This supply and what was previously in circulation formed the basis of silver exports to European markets in the 1950's. China's silver output could become significant if more nonferrous mines are developed in the future.

One of China's major sources of gold is the Zhaoye mine, located in the northwestern part of Jiaodong Peninsula in Shandong Province.[13] This ancient lode mine, with copper sulfide ores and high gold-silver values, is producing about 500 tons of ore per day. There are three large mills and a number of small mills. A recent survey has added about 250 tons of gold reserves to what had previously been known at Zhaoye, and more exploration work is taking place. Actually, there are additional gold deposits nearby, all located within Zhaoyuan and Yexlian Counties.

Heilongjiang's Heiho gold mining bureau has various gold mines—Kuntachi, Fandaging, Liumaoho, and Hantashihchung—mainly in the Aihui, Huanan, and Wulaga areas. A large gold-silver deposit reportedly has been found somewhere in Zhejiang Province. China's foremost silver mine is located in Wesihangcheng, Henan Province.[14] The Tehsing copper deposit apparently has fair amounts of gold and silver. Liaoning, Jiangxi (Yinshan mine), and Hebei have small lode gold mines. China recently ordered three 300-liter bucket dredges from the Mining and Transport Engineering BV of Amsterdam for use in northern China at a maximum dredging depth of 35 feet. The Chinese were also making inquiries of a U.S. bank for credits to finance gold operations.

Iron and Steel.—The Chinese were jubilant about their 1978 and 1979 steel production, claiming various national records after successfully combating the problem of the "gang of four" and more fully utilizing existing capacity. Steel production was in the neighborhood of 35 million tons per year at yearend 1979. According to Chairman Hua in early 1978, China's 1985 target for steel output was 60 million tons; however, this was subsequently scaled down to 45 to 50 million tons. By 1985, small and medium enterprises might account for an increment of 5 million tons per year or so; the rest of the expected gain will come from major steelworks existing or new.

With regard to new steelworks, construction of Baoshan (Paoshan) Steelworks in the Shanghai area had already started by late 1978. Baoshan is expected to have 6 million tons per year of steel capacity around 1985 and as much as 10 million tons per year eventually. A second large coastal steelworks called Chitung (Jidong) may not get off the ground until after 1985, and plans could be shelved again. As for existing steelworks, top priority will go to Anshan, in Liaoning Province, whose capacity would be roughly doubled eventually to approximately 15 million tons; basically, the expansion effort would involve building a new steelworks while modernizing the existing one. Depending upon the availability of funds and foreign exchange, long-range plans include the expansion of four other major steelworks from the present capacity of 1 to 3 million tons per year each to possibly 4 to 6 million tons per year; the four operations are Peking (Shoutu, Capital, or Beijing), Taiyuan in Shanxi Province, Wuhan in Hubei Province, and Benxi (Penchi) in Liaoning Province near Anshan.

China also intends to upgrade its special steel facilities. In January 1979, Japan's leading special steelmanufacture, Daido Steel Co., was contracted to help modernize and expand four existing special steel plants, Fushun, Luda, Dayeh, and Tientsin. The first three are presently rated at 300,000 to 500,000 tons per year, and their capacities will be doubled. Tientsin will be converted from an ordinary to a special steel plant. Daido Steel was also trying to get the contract to modernize the Peking Steelworks and its special steel plant.

China's mounting steel needs not only necessitate plant expansion but continued large imports as well. Japan has been China's leading steel supplier by far during recent years, furnishing 2.8 million tons of steel products in 1975, 3.5 million tons in 1976, 4.5 million tons in 1977, 5.6 millions tons (worth roughly $1.5 billion) in 1978, and 4.5 milllion tons in 1979. China was Japan's second largest steel customer in 1978 and 1979, not far behind the United States. The Federal Republic of Germany ranked a distant second to Japan as a steel supplier to China, and a dozen other countries each furnished 20,000 to 70,000 tons annually. Although building up steel capacity aims at reducing imports, cutbacks in imports are hardly likely in the next few years, in view of the very large steel requirements for basic construction. The Chinese were negotiating a 3-year trade pact with Japanese steel companies in February 1979 to obtain 15 million tons of steel products between the mid-1979 to mid-1982.

China's changing steel economy means that the iron ore base must likewise be expanded, whether domestic or foreign. Based upon the reported pig iron production, output of iron concentrate or high-grade ore of equivalent 60% iron grade can be estimated at more than 70 million tons per year. The Anshan Steelworks was making important progress in mining its "Mesabi" type of ores, with regard to both extraction tonnage and metal recovery. Knowledgeable Chinese have already visited the United States several times, and various U.S. firms and consultants have been invited to China. In the fall of 1978, Kaiser Engineers, Inc., was awarded a contract to expand Benxi's Nanfen low-grade iron mine near Anshan and develop the Szechiaying iron mine in eastern Hebei Province near Luanhsien, which appears to be in the heart of China's second "Mesabi Range."

In early December, Bethlehem Steel signed a contract to expand and modernize the Suichang iron mine. In early 1979, United States Steel Corp. successfully negotiated with China to build a mine plant in northeast China capable of producing 17 million tons per year of pellets (see below), and was subsequently asked to bid on building steelmaking facilities. During mid-January 1979, the U.S. firm, Midland Ross Corp., discussed the possible sale of direct-reduction steel furnaces to China; this process requires high-grade iron ore and often natural gas. There is also a plan to locate and develop at least 10 medium-size, high-grade iron deposits in the next decade. Reported new discoveries of such deposits with reserves of 100 million tons or more include Okou in Shanxi Province, a deposit (perhaps in Chienxi) in southern Hebei Province, a deposit in Sichuan near the Jinsha River, and two deposits in Yunnan Province, one in northern Yunnan and one in the northern part of the Hengduan Mountains.[15] A half-billion-ton iron deposit was very recently discovered in the Jiangyang region, Anhui Province.

The Chinese have already started a program to import high-grade iron to add to the low-grade domestic product and thereby improve smelting efficiency. Most such ores have come from Australia, which furnished about 1.5 million tons in 1976, 3 million tons in 1977, and over 5 million tons in 1978. Purchases from Australia in 1978 were over 6 million tons per year, including 2.4 million from Mount Newman and the rest mainly from Hammersley and Broken Hill. The North Koreans supply probably roughly 1.5 million tons of iron concentrate annually to China. Rio Doce of Brazil concluded a deal at yearend 1978 to export over 2.5 million tons of iron ore and 200,000 tons of pig iron during 1979-80 and expects a long-term contract thereafter. India, through the Minerals and Metals Trading Corp., have also made trial shipments to China in 1978. With the establishment of the Baoshan "coastal" steelworks, overall iron ore imports should rise sharply in the future.

One of the most intriguing aspects of steel developments in China is the establishment of the Baoshan Steelworks with Japanese help. Nippon Steel's board chairman Inayama has had a fine hand in this project, as well as in China-Japan trade in general, Japanese purchases of Chinese oil, and sale of Japanese steel and industrial products to China. It comes as no surprise that China's first coastal steelworks will be built by a consortium headed by Nippon Steel, the largest steel company in the world. The preliminary protocol was signed in April 1978, and by June, the Chinese were asking for the delivery of 240,000 tons of pipe pilings for the foundations (total of 600,000 tons for the project) during the remainder of the year. A launching ceremony for Baoshan took place on December 23, 1978, attended by China's Vice Premier Ku Mu and a 100-person delegation from the Japanese steel industry. This integrated steelworks, with an initial capacity of 6 million tons per year of crude steel, will be equipped with two 4,000-cubic-meter ultramodern blast furnaces, along with three 250- to 300-ton oxygen converters (BOF's), continuous-casting mills, and various rolling mills. Such a project will cost many billions of dollars. The first stage of the Baoshan Steelworks was originally scheduled for completion before the end of 1981, and the second stage, before yearend 1983, but there will be at least 1 year's delay.

West German firms may have the best chance to be selected to build the temporarily shelved Chitung (Jidong) Steelworks, to be located most likely in Luan Hsien near the coalfields and the port city of Chingwangdao, both in Hebei Province and not too far from the new Szechiaying iron mine and the older Chiennan iron mine. Scholemann-Siemag AG heads a consortium, including Dresdner Bank AG, Siemens AG, Thyssen AG, and Sterkrade AG, that made a $14 billion bid to build this integrated complex; the bid includes a buyer's credit repayable in 10 years.[16] The original hope was to install two 4,000-cubic-meter blast furnaces and three 300-ton BOF's by about 1985. The plan to complete expansion of the Szechiaying mine to supply Chitung, with the help of Kaiser Engineers, Inc., in building new mines and beneficiation and pelletizing facilities, however, was being implemented under a slower schedule.

Although exact plans to expand the Anshan Steelworks may not have been settled as of early 1979, the intention to make it into China's largest metallurgical complex is clear, possibly producing as much as 15 million tons per year of crude steel. Anshan already ranks about 20th among the world's steel complexes. Nippon Steel indicated [17] that it might take the lead to modernize and expand it in a manner similar to what was done at Japan's Yawata Steelworks, which would mean replacing Anshan's smaller blast furnace with large new ones, and older open-hearth steel furnaces with modern top-blown BOF's. A subsequent report[18] mentions a Sumitomo Metal Industries proposal to build a new 6-million-ton-per-year plant near the present Anshan Steelworks and modernize the existing plant, all for completion around 1985. The Chinese themselves are moving ahead to enlarge existing facilities and develop new ones. On January 5, 1979, a $1 billion contract was signed with United States Steel to build a mine plant at Chitashan (Jidashan)-one of Anshan's mines capable of producing 17 million tons per year of pellets plus 3 million tons per year of iron concentrates by 1983.[19] However, this program had not yet commenced by early 1980.

Anshan has 11 blast furnaces, including one of 1,513 cubic meters in size, another of 2,000 cubic meters, and the newest one of 2,580 cubic meters, which alone can produce about 1.5 million tons per year. The latest furnace is entirely Chinese built, and has been installed where No. 7 and No. 8 used to be. Anshan has about 25 open-hearth furnaces of various sizes and at least two 150-ton BOF's. The management has introduced top-blown oxygen practice to open-hearth operations with considerable success, and this has greatly increased Anshan's steelmaking capacity.

The Capital, Shoutu, or Peking Steelworks, located only 20 kilometers from the heart of Peking, was doing well in production and was being modernized and expanded during 1978 and 1979. With 1,000-cubic-meter and 1,200-cubic-meter blast furnaces, plus two other smaller ones, Peking produced about 2.3 million tons of pig iron and 1.3 million tons of steel in 1978. In the spring of 1979, a new 1,327-cubic-meter blast furnace was placed in operation, to replace the old No. 2 516-cubic-meter furnace. Peking was proclaimed as the leader in blast furnace practice within China, achieving a coke ratio of less than 450 kilograms per ton.[20] Pig iron output in 1978 was said to be about 45% higher than in 1977. Japan's Nippon Kokan advanced a proposal to build a $4.5 billion, 5-million-ton-per-year new integrated steelworks alongside the existing one.[21] The Peking Steelworks currently obtains iron ore from the Lungyen and Suichang Mines near Chienan. Located about 220 kilometers east of Peking, Suichang produces about 2 million tons per year of concentrates from 5 million tons per year of low-grade ore. The long-range plan is to produce 18 million tons per year of crude ore, utilizing both the magnetic and nonmagnetic portions to make pellets as well as concentrates.

The Benxi (Penchi) Steelworks in southern Liaoning Province near Anshan has been converted from a blast furnace works to an integrated steelworks. It has a new 2,050-cubic-meter blast furnace and four other blast furnaces (two larger ones about 900 cubic meters), capable of producing about 3 million tons per year of pig iron. A 1.6-million-ton-per-year sintering plant and a 65-slot, 370,000-ton coke plant have been completed fairly recently. Benxi's No. 2 steel plant became operational in 1978; three modern BOF's of Chinese design, probably 120 tonners, were installed in this plant. Benxi Steelworks produced about 2.5 million tons of steel in 1979. Iron ore comes from the nearby Waitoushan and Nanfen mines. Waitoushan has some high-grade ore, but Nanfen is mainly low grade, now producing about 7.5 million tons per year of raw ore. Kaiser Engineers, Inc., has the job of greatly expanding Nanfen by 1981 to accommodate future needs of new steelmaking facilities. Japanese steel firms, and possibly others, have made bids to add 4 to 5 million tons per year of steel capacity at Benxi.

The integrated Wuhan Steelworks had a bad year in 1979, producing only about 2.5 million tons of steel, because of power shortages. Steelmaking capacity may be closer to 3.5 million tons per year. Wuhan's steel output in 1978 was said to be 26% higher than the previous peak output, and pig iron, 11% higher.[22] Wuhan has three 1,500-cubic-meter and one 2,500-cubic-meter blast furnaces, four byproduct coke plants, nine open-hearth furnaces (most 500 tons), three small converters, and old hot rolling, plate, and rail mills. If Wuhan is to expand steel production to more than 5 million tons per year, large BOF's probably will be installed to replace some open hearths.

Installation of new West German and Japanese equipment has been behind schedule. It was not until mid-October 1978 that the 1-million-ton cold strip mill and the 70,000-ton silicon Sendzimer mills were placed in operation on a trial basis.[23] Apparently, the 3-million-ton hot strip mill, the 1.5-million-ton-per-year continuous casting mill, the 300,000-ton-per-year tinning line, and the 150,000-ton-per-year galvanizing line had not been completed by early 1979. However, everything should be in place by late 1979, and 1980 could be the year that Wuhan will be finally operating at design capacities. Wuhan uses mostly local iron ore from the Tayeh (Dayeh) open pit and the Zhenghai and Dahungshan underground mines, but increasing quantities of outside ore probably will have to be brought in in the future. Wuhan uses locally beneficiated sinter feed and has finally brought down the coke ratio to less than 500 kilograms per ton of pig iron.

Shanghai now has about eight small steelworks, together producing probably about 5 million tons per year of steel. Shanghai No. 1 Steelworks, the largest, was targeted at 1.8 million tons for 1979. the Taiyuan Steelworks apparently produces over 1 million tons per year of steel and 2 million tons per year of pig iron and expects to double steel production. It has small Austrian BOF's, and Voest-Alpine, which installed them, may have the inside track to build a large steelworks. Taiyuan brought the large Okou open pit and mill into production during 1977. The Baotou (Paotou) Steelworks in Inner Mongolia, with three blast furnaces of 1,513 to 2,000 cubic meters, small BOF's, and blooming mill, may be producing at the rate of about 1.1 million tons per year of steel. Baotou did well in 1978, reportedly fulfilling its steel plan 43 days ahead of schedule and establishing a record high.[24] Maanshan in Anhui is another steel center producing more than 1 million tons per year, and a new steelworks came onstream at yearend 1979. The ore is local, and a large number of small blast furnaces converts it into pig iron for use at Maanshan and nearby Shanghai. Visitors to the Chungking (Zhungching) Steelworks in Sichuan claim that its output is considerably less than 1 million tons per year. However, China revealed the completion of a 1.5-million-ton-per-year steelworks called Panzhihua in Sichuan Province near Dukou on the Chinsha River and was expected to expand facilities immediately.

The Tangshan Steelworks in Hebei, which was rehabilitated after the earthquake, seems to be the largest of the medium-size plants and capable of producing over 2,500 tons of steel daily. China has many other medium-size plants of 200,000 tons per year or more, including Changchun in Heilongjiang, Tunghua in Jilin, Dalien in Liaoning, Tianjin and Handan in Hebei, Anyan in Henan, Jinan in Shandong, Changchih in Shanxi, Lanzhou in Gansu, Dayeh in Hubei, Xiangtan and Lienyuan in Hunan, Nanking in Jiangsu, Hangzhou in Zhejiang, Chengdu in Sichuan, Kunming in Yunnan, Guizhou and Liuzhou in Guangxi, and Jiangbei and Canton in Guangdong. There are probably another 30 plants producing in excess of 50,000 tons per year, and 500 more smaller ones. These medium and small steel plants together produced 7 to 10 million tons of steel in 1978.[25]

Lead and Zinc.—According to Chinese officials at yearend 1979, China has the capacity to produce 250,000 to 300,000 tons each of refined lead and zinc annually. These figures seem high in the view of most western observers. Mine lead should be less than refined lead because of the scrap component, whereas mine zinc would be close to refined zinc output. The annual shortage of lead has been about 50,000 tons in recent years. Smaller quantities of zinc are imported, and occasionally some zinc has been exported also. The general lead-zinc shortage situation cannot be corrected until more deposits are developed, more mines expanded, and more smelters built. With the modernization program underway and the buildup of industries, demand for these metals should increase sharply, and it would not be surprising if consumption should rise to 500,000 tons per year or more for each metal within a decade. China's lead-zinc potential is much more promising than had been earlier thought, and in fact may prove considerable when carefully investigated. There seem to be many new deposits, and much additional exploration can be done.

The most interesting new development was the request for Japan's Mitsubishi Metal Corp. to assist in the development of China's lead and zinc industry.[26] The Japanese mission visited the Shenyang smelter in Liaoning, the Zhuzhou smelter in Hunan, and the Fankou mine in Guangdong, and other mines and metalworks during November 10-23, 1978. The Shenyang smelter has annual capacities of 40,000 to 50,000 tons of copper, 40,000-50,000 tons of lead, and 15,000 to 20,000 tons of zinc. The Japanese say that the Zhuzhou smelter, which is about 20 miles east of Hsiangtan, is rated at 120,000 tons per year of zinc and 50,000 tons of lead. Fankou has an annual capacity of 50,000 tons of combined mine lead and zinc (about one lead to two zinc) which the Chinese want to boost to 150,000 tons according to Mitsubishi. At Shenyang and Zhuzhou, the Chinese want to modernize facilities, including installation of pollution control equipment, with a view to expanding production considerably.

At Fankou, plans are to install up-to-date mining and beneficiation equipment and facilities. Fankou happens to be about 25 miles north of Shaoguan where the Imperial Smelting Process (ISP) people were licensed to build an ISP smelter rated at about 35,000 tons of zinc and 18,000 tons of lead; apparently, the Shaokuan smelter was never operated at full capacity. Mitsubishi was also asked to look into the development of three large lead-zinc deposits found through China's own efforts in Tsinghai Province (Sitiehshan), Gansu Province (Chengxian), and Sichuan Province, including integrated smelting facilities. The Chinese would like to undertake projects through production-sharing arrangements, but the Japanese would like to have part of the deal settled in cash.

Toho Zinc Co. (Japan's No. 2 zinc refiner) and C. Itoh & Co. were negotiating with the Chinese to build a 100,000-ton-per-year zinc refinery at a cost of more than $160 million.[27] At least one of the West German nonferrous refineries is a lead plant. There is a smelter in Sungbei, Hunan Province, that may be rated at 10,000 tons per year of lead and 5,000 tons per year of zinc. Fujien Province has a small smelter called Liencheng. Facilities have also been mentioned for Wuhan, Canton, Changchun, and Kunming, but these are mainly lead plants and apparently small. Shanghai has a 6,000- to 7,000-ton-per-year lead refinery cleaning up lead buillion from Hunan, in addition to larger copper refining facilities.

China's oldest lead-zinc mine is Shuikoushan in Hunan Province, which supplies the Sungbei smelter, among others. Around 1972, this mine had a capacity to produce 1,000 tons of ore (2.5% Zn, 1.2% Pb, and 2 grams Ag) per day from ore reserves of possibly 20 million tons. Apparently new ore bodies have been located deep below present mining areas of Shuikoushan. Also, rich nonferrous resources have been located in 10 other mining areas of Hunan, including Panchiachung. The Taoling lead-zinc-fluorspar mine in Hunan may be producing 3,000 tons of ore daily (about 2.5% combined lead-zinc and 10-15% fluorite), which might be equivalent to 15,000 tons per year of zinc and 10,000 tons per year of lead. A small lead-zinc mine with more than 1,000 workers has been opened in Hengtung County, Hunan; in early 1977, Hengtung had two beneficiation plants (probably both of 200-ton-per-day size), which turned out perhaps 3,000 tons per year of combined lead-zinc and 20,000 tons of fluorspar. There is a relatively new lead-zinc mine near the Liencheng smelter, located in the middle part of western Fukian. Huili in Sichuan is well known for zinc. Guangxi has a lead-zinc mine called Sidin. Xinjiang Province reportedly produces lead-zinc ore. Liaoning Province has small lead-zinc mines like Chingchengtzu (near Fushun), Hsiuyen, and the newly reported Chaiho mine in the northern mountainous region with 2,000 workers.

Molybdenum.—China's molybdenum production in recent decades has been centered at the Yangjiachangtzu mine near Zhinxi, Liaoning, where new reserves may be several million tons of 0.1%-0.3% molybdenum ore. The speculation is that output here has been more than 1,000 tons per year of concentrates. Molybdenum may occur in Sizhe, Xinjiang, and it is certainly present in Jiangsi's tungsten fields. Molybdenum might also be produced in Hunan Province. Of great potential importance, however, is byproduct molybdenum in China's porphyry copper resources. Specifically, molybdenum occurs within the ores of the large Tehsing (Dexing) copper deposit in Jiangxi Province being developed by the U.S. firm, Fluor Corp. Dexing ores analyze 0.4% to 0.5% copper and 0.03% to 0.08% molybdenum. There are already signs, therefore, that China could become a substantial producer and exporter of molybdenum a decade from now, just with presently known resources.

According to recent reports by Chinese geologists, large porphyry molybdenum deposits exist in Jilin and Shanxi Provinces, to make China even more important in world molybdenum supply. Lately, a number of lesser molybdenum deposits have also been found in coastal southeast China. Further, a sizable molybdenum deposit apparently has been discovered in western Hunan Province. One of these large deposits may already be in the process of development. With "moly" prices spiraling because of the special need for this strategic ferroalloy element in pipeline steels, the Chinese indeed have an incentive to develop a few really big mines. During 1978 and 1979, top management people from the U.S. firm, AMAX, visited China on various occasions, presumably to look over Chinese molybdenum (and tungsten) deposits.

Nickel.—China's nickel position was believed very weak at one time, with only one operating mine, Panshih in Jilin, having been mentioned in the press. Panshih is probably a small- to medium-size mine, and details are unknown. Cuba and the U.S.S.R. had been supplying China with nickel, with the latter stopping shipments in 1973. More recently, Canada sold about 42,500 tons of nickel to China during 1973-74 and much less thereafter. P.T. International Nickel Co. (P.T. INCO) has plans to sell Indonesian nickel indirectly through Japan to China. The Philippines is a potential supplier also. With more producers of lateritic nickel in the Pacific Basin, China should not have too much difficulty buying this metal.

In early 1979, the Chinese started to talk about a large nickel-copper sulfide deposit called Jinchuan in western Gansu that they had worked on for about 20 years. Several U.S. consultants had an opportunity to visit it also. Apparently, the property had been well drilled, although with a minimum of diamond drilling. There is a mine already, designed and built by the Chinese and capable of producing 10,000 tons per year of mine nickel plus copper. Reserves are said to be about 5 million tons of contained nickel, 3.5 million tons of mine copper, and 100,000 tons or more of cobalt in 0.8% to 1.0% nickel (also 0.5 to 0.6% Cu) ores. No doubt the Jinchuan mine will be greatly expanded in the not-too-distant future, especially since part of the deposit can be mined by open pit. Very likely, large-scale development would require foreign financial and technical help. Some of the nickel might be sold abroad in the future to pay for foreign services rendered.

Platinum Group Metals.—A major deposit of platinum, palladium, osmium, and iridium reportedly was discovered in the Dali area of western Yunnan Province, in 1971 by a provincial geological prospecting team.[28] Subsequent drilling has proved up the deposit. The Chinese feel that this discovery at Jinbaoshan in the Mitu area points the way to possible additional finds in the future. It was also reported that large chromite discoveries in the Tibet Plateau have high values in the platinum-group metals.[29] These metals are essential to China's industrialization and defense programs, and most requirements have had to be met by imports.

The Precious Metals Research Institute of the Ministry of Metallurgy has succeeded in making precious metal alloys of over 100 grades and 1,000 specifications since 1963. Before that time, China had to import all the alloys of gold, silver, platinum, rhodium, iridium, osmium, and ruthenium. Researchers made an alloy for conducting electricity in an instrument for aerospace use, whose wear resistance as a contact material is much better than imported platinum or palladium-based alloys. In May 1977, a new alloy containing 6% silver was developed for medium-load electrical equipment to replace pure silver; further, practical application problems have been solved. In June 1977, the Institute successfully made a palladium alloy amorphous film with good tensile strength and high resistance to wear and radiation, for use in nuclear energy and other fields of modern technology.[30]

Rare Metals.—Within 20 years China has emerged as a very important producer of rare earth and rare metals, both for the domestic market to meet the needs of the metallurgical, nuclear, chemical, electric, electronic, semiconductor, and special industries and for export. Chinese resources of rare-earth minerals are large, diverse, and widely distributed. In 1978, a new mineral, ($PbNbO_6$), was discovered in the Kangshan District of Changpaishan, Jilin. Guangdong Province's rare metals economy has become rather sophisticated and important. A National Conference on Rare Earths was recently convened at Paotou in Inner Mongolia, one of China's rare metal and steelmaking centers. Baiyunnobo, north of Paotou, has recently been described as a "mineral storehouse" for rare-earth minerals and by far the most important in terms of reserves. There is a Rare Earth Institute in Lanzhou in Gansu Province. China has also developed a high-purity metals industry capable of making 99.9999% pure tellurium, arsenic, cadmium, gallium, and germanium, along with many other metals of slightly less purity, including copper, lead, zinc, tin, bismuth, cadmium, antimony, gallium, nickel, phosphorus, sulfur, boron, arsenic, and lithium.

Guangdong Province reportedly has mastered beneficiation and extraction technology related to 40-odd types of rare metals.[31] During the fourth 5-year plan (1971-75), output value increased threefold each year to meet the needs of metallurgical, nuclear energy, chemical, electric, electronic, semiconductor, and other high-technology industries. Developments at the Pantan tin mine are worth mentioning. Discovered in 1958 for tin, this mine reportedly recovers 11 types of byproducts which together constitute two-thirds of the mine's output value. Germanium used for defense purposes is a new byproduct recovered, and technology has progressed to a state that germanium recovery has reached 75%. Kwangtung Province obviously has a surplus of rare metals.

The Japanese have good knowledge of China's "rare" metals industry, because of purchases of raw materials and sales of products and technology.[32] At yearend 1978, the Chinese made a special bid to sell rare metals (especially columbium or niobium) from Sinkiang to Japan. Sanyu Trading handles most of Japan's imports of Chinese rare-metals raw materials and manufactured products. A fluorescent-material plant is being built in China by the Japanese firm, Dai-Nippon Toryo Co., Ltd., for completion by 1980, to use all Chinese raw materials eventually but some Japanese intermediates in the meanwhile. China's yttrium is produced from xenotime, and its rare-earth chlorides contain as much as 0.2% europium. Mitsui Mining & Smelting Co., Ltd., of Japan, after visiting China for the second time at yearend 1978, reportedly offered to help develop rare metals in Inner Mongolia and Kiangsi Province on a production-sharing basis. Samples of ores analyzed revealed contents of samarium, cerium, yttrium, lanthanum, europium, and tantalum.

Apparently, China has abundant niobium resources and is producing niobium powder, bars, ingots, and oxide for use in steel metallurgy, electronics, optical glasses, chemicals, and especially superconductors. China also produces and exports beryllium-copper alloys, ferrotungsten, tungsten powder, other ferroalloys, and electrolytic manganese. Aside from exporting rare metals and compounds, China also sell concentrates such as xenotime, niobite, zircon, lithium mica, spodumene, single silicon crystal, and natural and synthetic quartz crystals. The best niobite is better than 60% in grade and contains impurities of less than 6% TiO_2, and 5% WO_3. Niobite is the source of columbium, tantalum, and their oxides. The top-grade zircon concentrate is better than 65% and contains less than 0.3% TiO_2 and 0.2% Fe_2O_3. Zircon, the main source of zirconium and hafnium, is used in China in nuclear energy, metallurgy, casting, refractories, glasses, and the making of special-quality alloys.

Tin.—Significant geological work has been done on the tin in southwest China. New tin deposits have been discovered in the tin mining districts of southern Yunnan, the western part of Yunnan Province, and north as far as western Szechuan. Within the northern part of the "Kang-Tien" (Sikang and Yunnan) axis, a tin sulfide deposit has been discovered and the potential seems good. Currently, a large skarn iron deposit with tin content is being investigated, and apparently the occurrence of tin in this western location in Liaoning Province is even more widespread than the iron. The tin here is of industrial value. (Tin in iron ore happens to have precedence in Malaysia, where tin was recovered nicely, but iron ore with tin was hard to market.)

Expanding and further modernizing the Gajiu (Kuchliu) Yunnan complex (which provides over 60% of China's tin) no doubt has been planned; this would entail integrated activity from exploration and development to extraction and refining. Conceivably, people who know about Bolivian tin mining and smelting could aid the Chinese in working the "dirty" Yunnan tin. The Guangxi "clean" placer tin from the Fuhochung District apparently has great potential, although currently employing techniques 20 years behind those of Malaysia, with few magnetic and electrostatic separators, tables, and good gravel pumps. Fuhochung deposits are not only amenable to the various "hydraulic" methods, but also to dredges in some places as well. Malaysia could help China mine placer tin, although there are some political problems at present. Apparently, a new smelter is being built somewhere in Guangxi. Reportedly, several tin deposits have been discovered in Hunan Province. There is a tin mine in Guangdong called Pantan whose output value is one-third in tin and two-thirds in byproducts (mainly rare-earth minerals).

A large complex tin deposit is being developed somewhere in Guangxi 100 miles from the Vietnamese border.[33] The mining area is said to extend for 60 miles, with reserves of contained tin at about 800,000 tons. The Chinese had previously announced that three large and two small nonferrous deposits had been discovered in the Hechih area, center of Guangxi's placer tin district. Apparently, the first phase of the new mine-mill complex had just been completed and construction of the second phase was underway. In the first phase alone, it was said that production of tin ore would reach 1 million tons annually, from which 4,000 tons of tin, 20,000 tons of zinc, 5,000 tons of lead, 3,000 tons of antimony, and significant amounts of rare and precious metals plus sulfur would be recoverd. This complex would certainly need a smelter, but it is not known whether the "Guangxi" smelter previously referred to is a "lode ore" smelter or a simple placer tin smelter.

In view of the ongoing modernization program, Chinese tin is becoming more important to China than the outside world. If China's steel production is to be doubled within a decade, then tin consumption should definitely top 20,000 tons per year, which is roughly twice current levels. Exports of Chinese tin (metal) has declined from more than 15,000 tons (large tonnages from stocks) in 1975 to some 7,000 tons in 1976, and 5,000 tons in 1977, and perhaps only 3,000 tons in 1978. The Billiton subsidiary of Dutch Shell has handled a large part of Chinese exports of tin, approximately 40% of which has come to the United States. The recent iron mines development contract signed with United States Steel stipulates partial payment by Chinese tin. This means that smelting facilities are adequate for present production estimated at about 20,000 tons per year. In view of the considerable resources, raising output by at least 10,000 tons per year seems a reasonable goal.

Titanium.—The Chinese have displayed titanium rods and sheets at one of the recent Canton Fairs, which implies that they may be able to produce titanium tetrachloride and titanium sponge. However, a commercial-size plant probably does not exist, in view of China's renewed interest in Japanese titanium technology. Companies like Kobe Steel, Osaka Titanium, various Sumitomo enterprises, and Toho Titanium were making plans to bid on the construction of such a plant, along with the British firm, Imperial Chemical Industries. Toho Titanium Co. recently completed a $3.3 million titanium trichloride catalyst plant within a petrochemical complex 50 to 60 kilometers from Peking, and officials of this company indicated that the Chinese seem to have sufficient supplies of raw materials like tetrachloride and sponge.

China has had many decades of commercial connections with Ishihara Sangyo, Japan's leading titanium dioxide producer and exporter. Ishihara signed a contract to supply China with 3,600 tons of rutile and anatase type of titanium dioxide worth $4 million.[34] Titania is used in making fibers, pulp, rubber, synthetic resin, paints and varnishes, and electric appliances, mainly as a white colorant. The Chinese themselves make some low-quality titanium dioxides. Overall, Chinese demand for this material has risen to about 1,000 tons monthly. When this reaches 2,000 tons, the Chinese might consider construction of a modern titanium dioxide plant within China.

The new Panzhihua Steelworks in Sichuan recovers a slag containing 30% titania plus vanadium. Possibly this can be upgraded to provide a titanium raw material.

Tungsten.—China has long been considered as having the largest reserves of tungsten in the world. Most Chinese ore is high-grade wolframite from the Dayu (Tayu) District of Jiangxi Province, but scheelite from Hunan Province has become important, and significant deposits have been found elsewhere in southeast China, particularly Guangdong and Guangxi. The best known mines in Jiangxi are Xihuashan (Hsihuashan), Dajishan (Tachishan), Gueimeishan (Kweimeishan), and Pankushan. Considerable recent exploration has been done on the known deposits of Jiangxi, including use of modern geophysical methods and studying the correlation of tungsten mineralization with tectonic systems, to locate "hidden" ore bodies (in fringe areas and at depth) and rejuvenate old mines. A typical large Tayu mine has hundreds of steep veinlets in a mineralized zone of several square kilometers with reserves of possibly 100,000 of WO_3 contained in ores assaying 1.2% WO_3 and 0.5% tin. Ore production is in the 2,000-ton-per-year range. Yangohiatan may be one of the scheelite mines in Hunan, but there are small wolfram mines in Tucheng County. Three better known mines in Guangdong are Yangjiang, Shihjenchang, and Yaoling.

According to Chinese geologists, some new types of ore bodies have been found in recent years that enlarge the tungsten resource base and open new avenues for exploration. For example, the Jiangsi Province traditional types are the quartz-vein wolframite ore bodies and skarn-type scheelite ore bodies. Included among the new types are black tungsten ore bodies formed by ultra-acidic sodium granitic intrusion; black ore bodies formed in fine veinlet intrusions of ultra-acidic mica quartz; and porphyry tungsten ore bodies, breccia ore bodies, and bedded multistage mineralization tungsten ore bodies related to weakly acidic granodiorites. Another important new development is the fact that tungsten mineralization has been found in various locations outisde of southern China. In fact, good deposits occur in the Tienshan fault-fold system of the northwest and the Chilienshan fault-fold system of northern China.

China's participation in the United Nations UNCTAD and the Primary Tungsten Association meetings in Geneva has not yielded much new information. However, a January 1979 trip to China by a U.S. "refractory metals" delegation did shed some light on the status of the tungsten industry. This delegation in visting the country's largest tungsten mine, Hsihuashan in Jiangxi, indicated that it has about 600 small, discontinuous ore bodies and a dozen levels (half on hillside), is fairly mechanized (3,000 employees), and produces 2,500 tons per year of concentrates. There is an acid-power plant using wolfram as raw material somewhere in Hunan, and a 1,000-ton-per-year tungsten carbide plant at Zhuzhou (Chuchow) with 2,000 workers. A 118,000-ton "reserve" wolfram deposit with 1.3% WO_3 grade ores, recently found in Guangxi Province, is scheduled to be developed into one of China's key "colored metals" projects. Interestingly, a 5-year Sino-French accord, signed in late 1978, calls for one of the scientific projects to be a geological study, principally of tungsten resources by the French. Very recent news indicates that the Chinese may be interested in an American bid to build a 2,000-short-ton-per-year paratungstate plant (perhaps mine also) specifically aimed at export. China's overall tungsten output in recent years has been estimated at about 17,000 tons per year of concentrates (or 9,000 tons per year of tungsten content) compared with possibly 9,000 tons per year of exports. Production can be greatly increased, and it may be higher than estimated, although the Chinese do not wish to disturb world prices.

Uranium.—The Chinese stated without details that their nuclear effort had become integrated, that they will redouble efforts to attain world technical levels, and that very extensive resources of uranium had been ascertained.[35] They further stated that many of the new discoveries had been made in new types of geologic horizons. One of the general areas mentioned for metalliferous and uranium ore finds is the Yunnan-Guizhou Plateau. A yearend 1979 report notes that the biggest uranium deposit in China, with 100 rich veins covering 100 square kilometers and occurring in granites, has been discovered.[36]

In earlier years, China's uranium came from places like Chuannan in Guangxi and Weiyuan in Guandong. Part of the ore extracted in the past went to Czechoslovakia to pay for the assistance rendered, with some of the beneficiation even done in that country. Uranium and other radioactive mineral occurrences have also been reported for Xinjiang, northeast China, Inner Mongolia, Qinghai, and southwest China. The Chinese say that they have discovered a new uranium mineral called Ziangjinaite. Africa's second-ranking uranium producer, Gabon, offered to sell uranium ore to China a few years ago in exchange for Chinese financial and technical aid in agriculture and industry. Late in 1978, it was reported that the European Economic Community may be interested in buying uranium raw materials from China.

The Chinese interest in nuclear energy has grown considerably during the 1970's after first exchanging visits with the Japanese and Canadians about 6 or 7 years ago. Very likely, the Chinese are thinking about large-scale nuclear power generation by the 1980's. There is some uncertainty about how fast they want to get into this field. In December 1978, as part of an almost $14 billion, 7-year trade agreement with France, the Chinese would get help from the French in constructing two 900,000-kilowatt nuclear generating plants along with the enriched uranium. The contract of building light water reactors presumably was to go to the Framatome unit of the Empain-Schneider Group licensing from Westinghouse Electric with U.S. approval. Subsequently, the Chinese had second thoughts about these nuclear plants.

Vanadium.—The China Society of Metals indicated that a new iron smelting technique had been developed at the 1.5-million-ton-per-year Panzhihua Steelworks in Sichuan.[37] Specifically, a ferrotitanium separation process was used to smelt vanadium-titanium magnetite ores in a blast furnace that allows the titania content of the slag to reach nearly 30% without ill effects. The mixed slags were further treated to yield tens of thousands of tons of vanadium slag annually. This process opens the way for development of similar deposits in the southwest.

NONMETALS

Asbestos.—China's production of asbestos has increased considerably during the last decade. As a world producer, China now ranks about fifth and provides roughly 5% of the world's total output. Demand has risen steadily, and many kinds of asbestos products are made to meet industrial requirements. Historically, China first used asbestos about 2,000 years ago for fire insulation, asbestos paper, and asbestos-lime-cement "fire pots." In recent years, the Chinese have had small surpluses of asbestos and asbestos products for export.

The foremost deposit in the country by far is Shihmien (which means asbestos in Chinese) in Sichuan Province. Shihmien's overall ore zone is said to be 6,300 meters long and 350 meters wide, with reserves of several tens of million tons of ore grading better than 2%. Chrysotile fibers of 2 centimeters or longer represent more than half of the total production. The best sample shipped to Geneva for exhibit was 1.3 meters long and the size of a bucket in circumference. There are over a dozen fairly up-to-date projects at Shihmien, including a good beneficiation mill, powerplant, and aerial tramway. Sichuan has a second major asbestos deposit called Penghsien, not too far from Shihmien.

Apparently, various lesser deposits are located in a belt from Jilin and Liaoning Provinces in the northeast to southwest China, passing through Hebei and Shanxi Provinces and Inner Mongolia. Asbestos fibers from Jilin and Taan, Shanxi, are said to be brittle but long. Those produced in Jin Hsien, Liaoning, are medium long and strong, suitable for making asbestos-cement products. Outside of Sichuan, the asbestos deposits of Laiyuan County, Hebei, are probably the most productive. The ore body known in the past embraces 5 to 20 veins (1 to several meters wide) that extend several kilometers in length. The chrysotile asbestos of Laiyuan is 2 to 5 centimeters in length, high in tensile strength, and suitable for high-quality products. Asbestos has also been discovered in Yuanjiang County, Yunnan Province.

Barite.—Chinese barite has been in great demand for oil and gas drilling. As of yearend 1979, production capacity had reached the 500,000-ton-per-year level, which represents 8% to 9% of the world total. China has exported anywhere from 40,000 to 120,000 tons per year of barite; and Chinese barite comes in three grades, 90%, 95%, and 97%. Europe and Japan are the principal markets. China has added various barium compounds to the list of exports in recent years. In 1977 and 1978, Japan imported an average of about 20,000 tons of barite and 10,000 tons of barium compounds annually from China. The Japanese say that China is using increasing quantities of barium compounds themselves for Braun tubes and ferrite magnets.

China's best barite deposits are probably replacements in limestone, dolomitic sandstone, shales, and residual materials. Extensive barite resources have already been found in China, and geologically probably much more can be discovered. Known deposits seem to be high quality and easy to extract, and reserves must be in the tens of millions of tons if not more. Known producing areas include Tangshan in Hebei, Hwanshan in Shandong, Xiuren in Guangxi, and Linchuan in Jiangxi. Large and high-grade barite deposits have been recently found in seven counties of Hubei Province.

Cement.—China's cement production capacity is firmly in fourth place behind the Soviet Union, Japan, and the United States, and considerably ahead of the Federal Republic of Germany, the fifth-ranked world producer. Output reportedly gained 17% in 1978 and more than 10% in 1979, over the previous years. As much as 60% of China's cement in 1979 came from perhaps 3,500 small cement plants, many of which have vertical kilns. About 20 of China's roughly 50 large- and medium-sized cement plants were said to have surpassed their full-year 1978 goals by late November. China has about four cement plants of 1 million tons per year or larger— Hantan in Hopeh, Yao Hsien in Shensi, Huahsin in Hupeh, and Liuliho in Peking— and up to 10 others of more than 500,000 tons. With regard to medium-size plants, China commonly builds rotary kilns of 30,000-ton-per-year to 100,000-ton-per-year sizes, the standard one being about 60,000 tons per year. Aside from ordinary portland cement, the current cement product lines include aluminous and phosphate cement; quick-setting, rapid-hardening, and high-strength cements; special cements for dams and oil wells; and white and colored cements.

Because of the improved stability and modernization programs, China was beginning to feel the temporary shortage of cement and other construction materials. Small purchases of Japanese cement were made by early 1978. Subsequent contracts with Japanese suppliers call for deliveries totaling up to 2 million tons of cement to China during 1979 at $60 per ton initially. (Price includes freight, to be renegotiated in May 1979.)[38] The effort to expand and modernize the large-plant sector had simultaneously begun. In August 1978, Peking sent inquiries to Kawasaki Heavy Industries, Ishikawa-Harima Heavy Industries, Mitsubishi Heavy Industries, and Kobe Steel regarding construction of new cement plants at about $200 million each. Although everything was still in the discussion stage, Kawasaki sent a mission to China rather quickly, and one of these firms probably will land the first contract. As an alternative to expensive new plants and to complement them, Japan's second largest cement producer, Nippon Cement Co., landed a contract to help modernize existing plants.[39]

Nippon Cement is expert in the fuel-efficient new suspension preheater system (NSP), which can greatly increase the capacities of existing horizontal rotary kilns. While on a mission to China visiting cement plants at Nanjing, Shanghai, and Liuzhou, Nippon Cement was asked to submit a tender aimed at boosting Liuzhou plant's capacity from 0.6 million tons per year to 1.5 to 2.0 million tons per year. This deal, if proven successful, would be a breakthrough for both parties concerned. Although details are not known, China is clearly formulating ambitious plans to expand the large-plant sector by both indigenous efforts and foreign help.

Diamond.—China's need for industrial diamonds has steadily increased, particularly for drilling purposes. Until 1971, most of the diamonds were imported. It was around this time that the Changde diamond mine in the Yuanjiang Basin of western Hunan was brought into production. Diamond deposits had also been found in Guizhou and Shandong Provinces. In mid-1978, a large diamond deposit reportedly was discovered in Liaoning Province after 5 years of geological work. Two years later, a single diamond weighing 159 carats was discovered in the Linshu County of Shandong Province by the Changlin brigade, after which it was named.[40] Apparently, the Chinese are seeking western help to develop the natural diamond industry.

In late 1973, synthetic diamond manufacture began, after the Institute of Physics of the Chinese Academy of Sciences and the Peking Grinding Wheel Works had jointly produced diamond crystals larger than 1 millimeter by the explosion method. More than a dozen units were "growing" inexpensive synthetic diamonds by this method for use in metallurgy, geological prospecting, oil extraction, machine manufacture, instruments, and defense industries. The most recent research work was in the agglomeration of small synthetic diamonds for industrial use. It was said that synthetic diamond drill bits were used to drill China's deepest oil and gas drill holes somewhere in Sichuan Province. One of the synthetic diamond plants, Tungcheng, located in Peking, recently was commended for the good-quality polycrystal diamonds it produced for use in oil and gas drilling. Most Chinese geological teams now use domestically produced diamond bits in hard-rock drilling, oil drilling, and defense industries.

Fertilizer Materials (Nitrogenous).— China's 1978 overall production of chemical fertilizers, measured in terms of "100% effectiveness" (apparently reflecting nitrogen plus phosphorus contents), was reported at 8.69 million tons, or 20% more than in 1977.[41] Output for the first 11 months of 1979 was given as 9.57 million tons, or another gain of some 20%. Shandong, the country's leading fertilizer-producing Province, achieved its 1978 target 91 days ahead of schedule, and Sichuan, 84 days ahead of schedule. Twelve other areas also had met their 1978 goals by late November including Hebei, Hunan, Shanxi, Zhejiang, Guangxi, and Shanghai. The fertilizer industry likewise did well in terms of technical-economic indexes.

During 1979, small nitrogenous plants produced 7.3 million tons or approximately 55% of the national total. For the already completed seven large foreign nitrogenous fertilizer plants, operational times and production capacities generally increased. Among these, the Taching, Sichuan, and Shengli No. 2 plants had each already surpassed their 300,000-ton-per-year synthetic ammonia design capacity levels. Several additional large plants were completed in 1979, and the rest of the 13 ultramodern plants built or being built by foreigners are expected to be onstream in 1980 or 1981.

Well over 6 million tons of contained nitrogen were produced in 1979. China has about 25 large fertilizer plants and more than 1,300 small and medium plants scattered around the country; about one-tenth of these are located in Shandong and Sichuan. A few years ago, a typical small plant produced 3,000 to 5,000 tons per year, and medium ones, 50,000 to 100,000 tons per year; capacities of a great number of such plants have since been enlarged, and even many small plants are producing over 10,000 tons per year. In late 1978, Liaoning Province had 15 chemical fertilizer plants of various sizes, together furnishing 1.5 million tons per year.

Eight of China's newly acquired foreign "whole plants" were being handled by Pullman-Kellogg Co. and its Dutch subsidiary. Standard equipment included 1,000-ton-per-day ammonia units of Kellogg design and 1,620-ton-per-day urea units employing the Stamicarbon stripping process. Two other plants with similar size units and having Kellogg ammonia equipment were being built by the Japanese team of Mitsui-Toyo Engineering. The remaining three facilities had been awarded to the French-owned Heurtey Industries, which installed Haldor Topsoe ammonia (200,000- to 300,000-ton-per-year sizes) and Stamicarbon urea units. The 13 plants combined will be able to produce nearly 7 million tons of equivalent urea or 3 to 4 million tons of contained nitrogen when the last one comes onstream by 1980. The eight Kellogg plants are located at Wolitun within the Taching oilfield, at Panchin near Shenyang, Changchou in Hebei within the Renchiu oilfield, Chihshui in north-central Guizhou, Changlin in Hunan, Wuhan in Hubei, "shores of the Jin-sha-jiang River" in Yunnan, and within the Luzhou gasfields of Sichuan. Heurtey's plants are located at Nanjing (Jihsiashan), Anching in southern Anhui, and Canton (Whampoa). One of Toyo's plants is at Chengdu (Nachi) in Sichuan and the other is in Shandong Province, either at Jinan or within the Shengli oilfield.

The Peking oil refinery and petrochemical works has a large nitrogenous fertilizer plant. One of China's older but sizable plants is the Jilin fertilizer works. Two other fairly large plants were completed a short while ago, one in Hochih in Guangxi Province and the other in Ulashan in Inner Mongolia. Xinjiang also has a nitrogenous fertilizer plant. The latest one of Chinese build is the Chaoching plant near Guangzhou (Canton) designed at 110,000 tons per year of urea. The Chinese are talking about buying new foreign facilities and technology again, including Kellogg knowhow. In fact, a contract was signed in early 1979 with Kellogg Continental in Peking for a 1,900-ton-per-year plant, calling for additional consulting, training, and administrative services, as well as detailed engineering design, and equipment and materials. A licensing agreement was signed with Stamicarbon of the Netherlands for their urea plants of 1,620- and 1,740-ton-per-day capacities. One such unit probably will be built by the Chinese themselves near Shanghai in Zhejiang Province. Apparently, Ube Industries of Japan has won the bid to build a plant using residual oil from a nearby refinery to complete the above urea complex in Zhejiang. Lurgi Gesellschaften of the Federal Republic of Germany recently won a contract to build a 1,000-ton-per-day, coal-fired ammonia plant. Toyo Engineering will build nitric acid and nitrophosphate plants in Shanxi Province.

China continued to be by far the largest importer of nitrogenous fertilizers in the world, despite efforts to raise output sharply. Most imports by China have come from Japan. Ratified contracts called for Japanese delivery of 240,000 tons of ammonium sulfate, 850,000 tons of urea, and 270,000 tons of ammonium chloride during 1978; and 200,000 tons, 550,000 tons during the first half of 1979. Corresponding figures for Chinese imports from elsewhere are not known. However, during the second half of 1977, when Japan was supposed to deliver 542,000 tons of urea to China, 250,000 tons were scheduled to come from NITREX and 100,000 tons each were scheduled to come from Indonesia, Iraq, and Kuwait.

Fluorspar.—China has been an important producer and exporter of fluorspar for several decades, and annual output probably has been in the 300,000- to 400,000-ton range. A large surplus has been traditionally exported, mainly to Japan and the Soviet Union in the past, and more recently only to Japan, which took 111,147 tons in 1977 and 150,000 tons in 1978. However, Japan's fluorspar requirements for steelmaking have dropped sharply on a unit basis, and high-grade materials are preferred over Chinese metspar. Most Chinese fluorspar is metallurgical grade, although a significant share is acidspar. Very high-grade lump fluorspar was trial shipped to the U.S. market in recent years. China consumes possibly 100,000 tons of fluorspar annually, at least 50% by the steel industry and 25% by the aluminum industry. The country was becoming interested in hydrofluoric acid. Fluorspar demand should top 200,000 tons per year within a decade. The leading producing districts are Wuyi in Zhejiang Province, Kaiping in Liaoning Province, Lunghua in the former Jehol Province, Taoling in Hunan Province, and Pecheng in Fujian Province. Fluorspar has also been mined in Shandong and Guangdong.

Jade.—Exotic green-color jade is mainly a gem stone or ornamental stone, and there are no valuable synthetics. Some jades are somewhat whitish. The commercial term "jade" usually means jadeite to the Chinese but can also mean nephrite to other people. Jadeite is much more radiant in color than nephrite and commands a much higher price. Although southwest China is traditionally famous for jades, the best jade at one time came from upstate Burma, where Chinese merchants bought the crude blocks of stone encompassing jade and sent them to Hong Kong and elsewhere in the Orient for Chinese artisans to cut and sell. China's current work in extracting and cutting jade is little known. So far, little jade enters the world market, although this situation may change.

Peking officially reported that a large piece of probably crude jadestone, nearly 80 cubic meters in size and weighing more than 160 tons, was found somewhere in Liaoning close to the surface.[42] The huge stone was described as "emerald green tinged with vermillion, blue, and cream highlights." It was reported that significant deposits of jade and other precious stones were found in 11 locations within the autonomous region of Ningsia.[43] The types include agate, dark green jade, rose quartz, malachite, amethyst, ruby, sapphire, cat's eye, and transluscent agate. The deposits will be worked to produce agate ball-bearings, agate balls, and powder for industry, and grinding tools and measuring instruments including balances for scientific research.

Magnesite and Talc.—These geologically associated minerals, including soapstone, occur in a belt extending from Dashihchiao (Daling) northeast to Lienshanguan in Liaoning Province. The country's magnesite resources are very extensive by world standards and are reasonably high grade. Earlier western estimates of yearly production at about a million tons are far too low. The need for refractories in the steel industry is steadily expanding, and there is demand for magnesia in export markets such as Japan.

Chinese talc from Dashihchiao near Haicheng is very high grade and well known internationally. Japan, the main customer, imported 23,552 tons of Chinese talc in 1978 and 175,433 tons in 1977. Based upon these and other imports by other countries, China's talc production probably has surpassed 350,000 tons per year. In addition, possibly 150,000 tons per year of soapstone are also produced at Dashihchiao. Japan is again the leading buyer. Japanese statistics show that Japan also imported 10,494 tons of natural steatite in 1977 from China and 15,087 tons in 1978. The Luchuan deposit in Guangxi Province has been mentioned as a new area for talc and soapstone. Increasing quantities of talc, soapstone, and pyrophyllite will be needed in China for making paper and paint and for filling materials in general.

Phosphate Rock.—By raising phosphate rock production capacity to more than 5 million tons per year, China has cut down imports significantly since the early 1970's. Morocco tripled phosphate rock prices in late 1973, and this caused supplies from there to dwindle; later, however, Morocco adjusted prices downward. The Laokay area in Vietnam south of Yunnan Province was at one time an important source of foreign supply, but relations with Vietnam are indeed strained of late. In fact, the Laokay operation suffered severe damage in the recent conflict. Some Florida phosphate pebbles have been shipped to China in recent years, and a contract was signed in late 1978 with the U.S. Phosphate Chemicals Export Association to furnish China with 900,000 tons of U.S. phosphoric acid.[44] A Chinese Fertilizer Delegation had visited Florida near yearend 1978, and a five-man U.S. team of phosphate experts was subsequently invited to visit China. Basically, the Chinese policy is to develop indigenous resources as much as possible (in part with foreign help), and import whatever additional quantities that are necessary to meet expanding requirements.

China's phosphate rock resources are widespread throughout the eastern and southern areas of the country. Reserves may be rather extensive but the quality is uneven and often poor. Historically, the best known deposits are located in the Provinces of Yunnan, Guizhou, Hunan, and Hubei. Within Yunnan, there is recent news about two operations 5 miles apart and within 40 miles south of Kunming. Kunyang is the name of the older mine and Haikou is the new mine being developed. Kunyang's output has already reached 1.5 million tons per year, and its capacity is being expanded. Haikou has been described as a very large and high-grade phosphate rock deposit that is easy to mine, and the rock is suitable to make into compound fertilizers because of the low magnesia content.[45] Samples of the phosphate ore from Haikou were sent to the Albany (Oreg.) Research Center of the U.S. Bureau of Mines in late 1978 for characterization and beneficiation tests.

The ore, comprised of altered and unaltered phosphate, seems similar to the phosphate of the western United State; reserves at this mine amount to about 65 million tons. Yunnan officials were trying to popularize phosphate fertilizers, having conducted meetings in 1978 at producing areas like Chuching and Hsuanwei Counties, 100 and 150 miles, respectively, northeast of Kunming. Kaiyang, in Guizhou Province, to the north of Guiyang has one of the largest phosphate mines; and Fuchun, about 50 miles to the east of Kweiyang, is reported to have a very extensive deposit of high-grade ore (with iodine values), found near the surface and easily accessible to transportation.[46]

Liuyang, Shihmen, and Huachiao are known locations of phosphates mining in Hunan. The Chingxiang mine in Hubei had an annual capacity of 600,000 tons of phosphate rock. A 20-million-ton deposit may have been discovered in Chaoyangling, Jiangxi. Many localities in Foshan, Guangdong Province, have phosphate operations. A high-grade deposit was found in the Hsuaiyiling area (Datu River), Sichuan. Anhui has the Susung mine near Anching. North China's largest phosphate deposit is called Fangshan in Chulu Hsien, Hebei Province. A phosphate shale mine has started operations in Changbei County, Jilin. Shandong, with its many small mines, has emerged in recent years as China's leading phosphate-producing Province. Promising phosphate deposits have been found in Inner Mongolia and Liaoning Province.

The bulk of the phosphate rock supply is converted to chemical phosphates, although some is directly applied in the ground form. China must have over 1,500 small phosphate plants, which account for 75% of the national output. Shandong has nearly one-third of these plants, along with over 200 small phosphate rock mines and dozens of small pyrite operations. The rest of the "local" plants are rather spread out. Relatively important superphosphate plants have been built in places in Nanjing, Changsha in Hunan, Hunghochou in Yunnan, Shanghai, Taiyuan in Shanxi, Guangzhou and Changshou and Chanjiang in Guangdong, and Yingtan and Tungxiang in Jiangxi. The Chinese have started to use spent shales, cement wastes, slags, and boiler ashes for phosphate raw materials. In line with the thought of acquiring good foreign technology, a large nitrophosphate plant was ordered from Toyo Engineering of Japan in January 1979.

Potash.—Recent potash sales to China have been at record levels.[47] Canpotash Limited, representing Saskatchewan potash producers, signed a contract to ship 300,000 tons of muriate of potash from Vancouver between October 15, 1978 and June 30, 1979. During July and August 1977, Canpotash had shipped 50,000 tons to China. The Chinese have found that much more potash is needed to complement the many modern urea plants recently completed. Accordingly, they were looking into the matter of possibly inviting another Canadian potash technical mission to visit China in 1979.

Potash is being recovered from saline operations, sedimentary rocks, and various waste materials within China, although not yet in large quantities. Liaoning and brine works at Tzugung, Sichuan, have been recovering potassium chloride. At the Chaerhan salt lake works, Zhaidam, a very efficient potash recovery technique was successfully developed.[48] Deposits of potash in Shangong seem to be rather deep, but Shangong geologists found a sizable zeolite deposit which proved helpful in recovering potash from seawater. Kiln dust from cement plants and ashes from coal thermal plants have been used in various places as potash fertilizers. Guangdong Province has several dozen small potash-phosphate plants (together producing 600,000 tons per year) and another two dozen potassium-calcium fertilizer plants (combined 150,000 tons per year). Sichuan Province also has a number of small potash-phosphate plants in operation. Potash deposits were recently reported for Jiangcheng, Yunnan Province.[49] Once China starts to look seriously into its sedimentary potash potential, it is likely that important deposits will be found.

Pyrites.—Although generally short of sulfur, China should become much more important in the near future as a world producer of pyrite, because of mines being developed and new deposits found in recent years. Output capacity is already approaching 3 million tons per year, from principally two major pyrite mining areas—Ziangshan (Hsiangshan) in Anhui and Yingde (Yingte) in Guangdong. Also, pyrite in Sichuan Province has been converted to elemental sulfur, and sizable tonnages of pyrite are being extracted in Shandong Province. Two years have passed since it was claimed that China's largest pyrite project in the Yuanfu area of Guangdong had been half completed, including open pit, railroads, dock, water reservoir, and powerplant facilities.[50] In early 1979, it was further reported that construction had started on the Samsui (oilfield)—Maoming (shale oil and industrial center) Railroad which will have a bridge over the Xijiang (West River) and directly passes through the Yunfu pyrite center. A U.S. mining design firm apparently has been assisting in the development of Yunfu. Takungpao of December 21, 1979, reports that 15 million tons (30% grade) of additional pyrite reserves have been delineated in Yingde County and that "this is Guangdong Province's fifth large pyrite mine." A sizable pyrite deposit has been discovered in southern Sichuan near a coal base, and more prospecting is taking place. One-third of the uncovered ore can be easily mined, and good river and road connections also favor early development. Further, with the development of a large copper mines in Jiangxi and elsewhere in the future, byproduct pyrite production will become significant.

Salt.—For the first time, China reported its salt output—19.53 million metric tons for 1978.[51] This figure appears to be considerably lower than actual production, since the salt converted to industrial chemicals (including brine salt from Sichuan) is probably not included, and reported data are most likely incomplete. China is second only to the United States as a world producer of plain salt. Unlike the United States, which works on rock and brine salt, over 80% of China's salt is derived by solar evaporation from wind-protected shallow bay areas along the coast. A large part of Chinese salt is for food purposes, but industrial needs are climbing sharply.

Roughly 60% of China's salt comes from around the Pohai Bay. Within the bays of the Liaodong Peninsula, there are the Luda and Yingai salt fields occurring south of the Panshan oilfields near the mouth of the Liao River; the salt produced near Panshan is high in borates. The Tanggu salt field, China's largest, near Tientsin was damaged in 1977 by earthquakes, but were quickly repaired. The salt fields on the north side of the Shandong Peninsula are adjacent to the Shengli oilfields. The Jiangsu coastal salt fields on the south side of this Peninsula, which produced about 2 million tons of salt in 1979, are in an offshore area where oil prospects are also good. The good saltfields down south are in the Guangdong Province, Hainan Island bay areas. Many large rock salt deposits undoubtedly will be found in the future, such as the newly discovered Jinggangshan rock salt deposit in Kiangsi Province.

Recognizing the potential need for industrial salts of all kinds, China has started to investigate such resources on land, underground, and in basins and dry lakes. One of the interesting recent discoveries is a large deposit of high-grade natural soda at Nanyang, Dungpo Hsien, Henan Province, within the Paleogene system of Cenozoic rocks.[52] At a mine called Wucheng, a special technique for extracting underground soda deposits was devised, involving a double-concentric-pipe system to reach the soda beds; water is pumped down through the inner pipe, and dissolved soda returns to surface through the outer pipe (somewhat like the Frasch Process for sulfur).

China's production of other kinds of industrial salts has also made significant progress, along with basic investigations as to their origin, availablity, and extraction problems. The Zhinghai (Tsinghai) Salt Lake Institute of the Chinese Academy of Sciences has recently completed a survey of more than 1,000 salt lakes in the Tsinghai-Tibet Plateau, which together represent half the dry, semidry, and salt lakes in the entire country.[53] Two important scientfic books were published on this general subject. One is entitled "The Salt Lakes of the Zhaidam Basin," and provides good scientific guidelines to exploration for new saline sedimentary beds. The second is called "Methods for Analyzing Brine and Salts," and evaluates the chemical and physical properties of the pertinent minerals and elements.

A description of the over-3,000-year-old Yuncheng inland salt field (semidry lake deposit), located in the southwestern part of Shanxi Province, appeared in the press.[54] This salt field is 20 to 30 kilometers long and 3 to 5 kilometers wide. It is a complex salts storehouse, much like Searles Lake in California. Aside from large tonnages of sodium sulfate, sodium chloride (edible salt), magnesium sulfate, and calcium sulfate (gypsum), there are many lesser minerals and elements such as bromine, iodine, potassium (potash), borates, lithium, and many rare elements. Only edible salt was produced in the past, but Yuncheng has now been modernized into a chemical raw material base with sodium sulfate as the foremost product. The degree of mechanization has steadily increased, output has been continually expanded, and a greater variety of products has been manufactured, including dehydrated sodium sulfate, sodium chloride, sodium silicate, and bromides, etc.

China, with arid-climate geology in some areas, probably will someday uncover important tincal and colemanite deposits, if it has not already done so. There is a 40-square-kilometer "borate" lake called Iksaydam, located north of Chaerhan (phonetically similar to Chaka, Chahai, Charkhan, etc.) in the Zhaidam Basin of Zhinghai, and a 100-square-kilometer "potash" dry lake at Chaerhan itself. Both, and others as well, seem to be similar to Searles Lake in California, which produces borates, potash, and other chemicals. A borax plant with "hundreds of furnaces" was reportedly built at Iksaydam over a decade ago. The Chaerhan works has a 2.3-kilometer, double-track railroad built to it to bring out about 100,000 tons per year of various salts. A new process was recently devised to extract carnallite from the Chaerhan Lake based upon the "daily salt separation (crystallization) quota." Another technique for making potassium fertilizer was similarly developed to increase potash output by twentyfold. Additionally, a method to extract boric acid directly from the borates obtained from Chaerhan's mixed salts, through the use of sulfur dioxide, was introduced. The Chinese claim, generally, extensive resources of lithium and borates in the lakes of Tibet, too. Japan, among other countries, had been importing several thousand tons of chemical borates annually from China. China's fiberglass plants constructed in recent years undoubtedly use some borate as raw materials.

Other Nonmetals.—Important discoveries were recently made of bentonite, kyanite, and phosphate rock.[55] In fact, 10 million tons of high-grade sodium bentonite was uncovered in the Lin-an District west of Hangzhou in Zhejiang Province. Another large deposit was reported for Tuokehshun in Sinkiang with no specifics. Bentonite is used as a heat-resistant lubricant, as a refractory material, and in oil drilling. Kyanite was said to have been discovered in Shanxi and Hebei Provinces. Kyanite is another high-temperature refractory material, used in making pottery and porcelain and in steelmaking. In fact, some of the kyanite is destined to be used by the ultramodern Shanghai Baoshan Steelworks now being constructed. In the process of discovering and developing the Fuchan phosphate mine in Kweichow Province, high values of iodine were found to be embedded in the phosphate ore.

Lithium deposits, believed by the Chinese to be the biggest in the world, have been found in the salt lakes on the Tibetan Plateau.[56] The Zhinghai Lake Research Institute in surveying northern Tibet and Ngari District reports that extensive resources of sodium, potassium, boron, lithium, bromine, rubidium, cesium, and radioactive elements are present in the salt lakes, with particularly plentiful amounts of lithium and boron. Large quantities of borates reportedly lie exposed on the surface within beds several meters thick.

The previously mentioned new mineral belt extending over 550,000 square kilometers through the Yunnan-Tibet-Sichuan-Zhinghai border areas is not only rich in metal prospects but also has promising deposits of nonmetallics as well, such as troilite, potash, mica, asbestos, gypsum, arsenic, magnesite, and limestone. A 90-million-ton gypsum deposit was recently discovered in Sihui County, in southeastern Guandong Province, and mine development is already underway. Fukien, as well as other southern Provinces, is said to have large deposits of pyrophyllite which can be made into good refractory firebricks for use in steelmaking; in fact, the Ministry of Metallurgy is helping Fukien authorities to make refractories. Various groups are working on or doing research in refractories at, for example, Loyang and Tieanjin. The Shanghai Silicate Institute of the Academy of Sciences is said to have succeeded in making synthetic mica of good quality.[57] An important zeolite deposit has been noted for Lishui County, Zhejiang Province; additional deposits might be found in other counties of this Province, such as Chunhua, Ningbo, and Taichou. Zeolite is used in absorption and catalytic processes, and therefore important industrially.

MINERAL FUELS

Coal.—For the first time, the State Statistical Bureau of China officially reported China's coal output—550 million metric tons for 1977 and 618 million tons in 1978. Output in 1979 was said to be 628 million tons (preliminary). All these figures would be the marketable tonnage, the average heating value of which might be 10% to 15% lower than the mean of U.S. coals. China is one of the big three world producers of coal, roughly on a par with the United States and the Soviet Union. Chinese production consists almost entirely of hard coals, including 25 to 30 million tons per year of anthracite. The initially announced goal of planners is to top 1 billion tons by about 1987.[58] The Japanese stated that Chinese coal reserves may be on the order of 1,500 billion tons, adequate to support much higher output levels. Other estimates credit China with as much as 10 trillion tons of reserves. A very recent Chinese estimate places total coal reserves at 5 trillion tons, of which 600 billion are recoverable at present.

1979 marked the beginning of China's "coal adjustment program." The goals of the program are to reestablish proper relations between geology and design work and between tunneling and excavation; to assure adequate supplies of machinery and equipment for production to emphasize, miners livelihood and working conditions; to evaluate economic viability of mines and enterprises; and to strengthen coordination between production and transport.

Eight very large coal bases, each with a cluster of mines together producing 20 to 50 million tons per year, are currently being constructed or expanded around the country along with another 40 or so smaller coal bases. According to the Ministry of Coal Industry, China opened 22 coal mines in 1979 aggregating 9.5 million tons per year in combined capacity. In addition, 10 existing mines were enlarged, adding another 4.5 million tons per year.[59] Major coal mine construction projects were reported for the Kailan, Huainan, Huaipei (Huaibei), Tatung (Datung), Yenchou (Yanzhou), Kuchiao (Gujiao), and Huolinho coalfields. For existing mines, greater mechanization will be introduced whenever possible, using both Chinese and foreign equipment. Chinese coal seams are generally deep, which explains why so little strip mining has been done. However, considerable interest in strip mining was shown by the coal mining delegation that toured the United States in the fall of 1978 and by the Chinese who hosted several U.S. coal delegations. During 1979, the Chinese were trying to get help to develop the Yimin open-cut coal mine in Heilongjiang Province into a 20-million-ton-per-year operation and, as noted, had already started work on the Holinho lignite coalfields in Jilin Province.

The predominant proportion of Chinese coal is produced in the eastern third of the country, where the population is also concentrated and where known reserves are primarily located. About half of China's 1978 coal output came from northern China, headed provincially by Shanxi with roughly 95 million tons, Shandong with 50 million tons, Henan with 45 million tons, Hebei with 40 million tons, and Inner Mongolia, Shanxi, Gansu, and the former Ninghsia, each with 8 to 12 million tons.

In northeast China, Liaoning produced about 60 million tons; Heilongjiang, 40 million; and Jilin, nearly 20 million. Anhui produced over 25 million; Yunnan and Sichuan, 20 to 30 million each; Jiangxi, Guangdong, and Hunan, 15 million each; Guizhou, 11 million; and Jiangsu, 8 million tons. The gain in 1979 was across the board but with sharper increases in Shanxi and Shandong Provinces particularly. Surveying and basic construction have been accelerated in previously coal-short southern China or Chiangnan (Yangtze River and south). China has a total of over 20,000 small mines that together furnish about one-third of the national output.

Hitherto, almost all the coal mines have been developed by the Chinese themselves; however, the effort to buy foreign equipment and seek specific outside help has been accelerated. West German firms (Krupp, Orenstein & Koppel, Demag, Thyssen, GHH, Ruhrkohle, and Wesshuette) signed a DM8 billion protocol to help develop five deep-shaft hard coal mines of roughly 4 million tons per year each and expand a sixth one from 3 to 6 million tons per year; all of these mines are within the Kailan coalfields of Hebei Province and the Huainan, Huaipei, and Linhuan (Leonwei) coalfields of Anhui Province. Some of the coal developed will be exported to Germany. In addition, the Germans are to develop the 2-billion-ton Huolinho lignite deposit in Jilin Province, northeast China, into a 20-million-ton-per-year operation.

The British National Coal Board, together with Powekll Duffryin, was asked to help build two new major coal mines in Tatung, Shanxi. Part of the future output is slated to fuel a new powerplant to be constructed in Hong Kong. Late in 1978, the Japanese were asked to help develop two steam coal mines, one within the Yanzhou (Yenchou) coalfields of Shandong and the other within the Kuchiao (Gujiao) coalfied of Shanxi; the coal will be shipped as payment for investments. The Chinese were looking into other arrangements with the Japanese in Hebei, Henan, and Liaoning Provinces. The two countries have discussed coal beneficiation facilities also. The Chinese coal industry is increasingly interested in U.S. surface mining equipment. The Poles are selling some coal equipment to China. The French sold longwall coal cutting machines to China, and the British, retrievable supports.

Most Chinese coal mines have some kind of upgrading or beneficiation facilities, although few have sophisticated plants. One might guess that up to 150-200 million tons per year of Chinese coals extracted represents the mechanically cleaned variety. However, the Chinese are getting very interested in coal preparation, witnessed by equipment purchases from the West and invitation of several of the best known U.S. specialists in this line to visit China. Reportedly, cleaned coal has increased one-third in 1978 compared with 1977. There has been keen competition among coal combines and mines to improve coal quality; around the end of 1978, a national meeting on this subject was called in Tsaochuang, Shandong Province, to evaluate recent performance.

In line with better utilization, mass efforts were being made to use coal middlings, low-grade coals, coal shales, and even tailings as fuels or raw materials to produce building materials, chemicals, (such as alum and aluminum chloride), and rare metals. China apparently has over 100 billion tons of easily minable bituminous coal shales scattered mostly in southern China. In Hebei Province alone, about 5 million tons per year of intermediate grades are being utilized, which is equivalent to over 1 million tons per year of clean coal in heating value (the practice is to mix 10% to 20% of this in boiler use), plus raw material for cement, refractories, and chemicals. Two other important coal-producing Provinces, Liaoning and Shanxi, are also utilizing such raw materials on an increasing scale. In 1979, Zhejiang Province used about 3 million tons of bituminous shale of 1,000-2,000 kilocalories in fluidized bed boilers.

Kailan (Kailuan) Combine's seven underground mines were fully rehabilitated by early 1978 so that capacity was brought back to 25 million tons per year of raw coal or more than 20 million tons of dressed coal. Roughly 370 kilometers of roadways was restored, along with all the shafts. The Tangshan coal dressing plant was totally rebuilt, and hydraulic mining was resumed at the Luchiato mine. In 1978, an 8-year plan was drawn up to transform Kailan into one of the world's most modern operations. Another plan was drawn up for the complete restoration by 1982 of Tangshan City, which is located in the center of the Kailan enterprise and which was nearly totally demolished by earthquake damage in 1977.

Shanxi, China's leading coal-producing Province, produced at least 95 million tons of coal in 1979; projects already initiated could bring output in Shanxi to the 150-million-ton level by the late 1980's. The Tatung (Datung) Combine, with 13 collieries, may be producing close to 25 million tons per year of low-ash, low-sulfur, and high-heating-value bituminous coal (including coking coal). Tatung's new 5-million-ton-per-year Yentzushan mine was being developed in 1978. Shanxi's No. 2 combine, Yanchuan, produces up to 15 million tons per year of anthracite and constitutes one of China's two major anthracite-producing areas. Many westerners have visited these two combines. Shanxi Province also has small mines, which together produce upwards of 30 million tons of coal yearly at the present time. Additionally, the Chinese are interested in building a 20-million-ton-per-year surface combine at Antaipao in Shanxi Province.

The Pingtingshan (Pingdingshan) Combine in Henan Province, with its famous coking coal, reportedly led all Chinese coal combines in surpassing targets.[60] During the first 10 months of 1978, the output goal of this combine was reportedly exceeded by more than 1.8 million tons. For each 10,000 tons of coal produced, the combine's timber consumption was reduced to 80 cubic meters, and its "loss rate" for metal props was lowered to 0.17%. Pingtingshan has 13 collieries, 3 shaft-sinking locations, and about 75 coal-producing teams. Pingtinshan's capacity probably was in the range of 12 to 14 million tons per year as of early 1979.

Huainan, the oldest of Anhui Province's large combines with about 11 collieries, may have pushed production up to 11 million tons per year by 1978. The newer Huaipei combine is a little bigger and still expanding. The third large coalfield in Anhui, called Linhuan (Leonwei), said to have several times the reserves of Huaipei, was under development. Very likely, the West Germans will be involved with Huaipei and Linhuan. The Fengfeng and Tungfeng combines in Hebei Province and the Wumeng complex in Guizhou (coking coal) apparently topped the 10-million-ton-per-year level for the first time. Another combine to the south, Hsuchow (Xuzhou), within Jiangxi Province, has undergone great expansion and may have produced 12 million tons in 1978. Nothing spectacular happened to the two major coal combines in Liaoning Province, Fushun, rated at about 12 million tons per year, and Fushin (Fuxin), which produces over 15 million tons per year; in fact, production from these combines may have started to decline. Heilongjiang Province's pair of roughly 13- to 15-million-ton-per-year combines, called Hokang (Hegang) and Chihsi (Jixi), produced at capacity during 1978 and 1979. The above review shows that China now has more than a dozen combines of 10 million tons per year or greater. China also has approximately about 20 identifiable coal combines of 3- to 8-million-ton-per-year capacity.

Petroleum and Natural Gas.—China surpassed the 100-million-ton-per-year (or 2-million-barrel-per-day) level for the second year in a row, but the announced output gain in 1979 was only 1.9% over 1978. The Chinese talk about trying to develop 10 to 15 "Tachings" within the next two decades. During 1979, China's premium oilfield, Taching (Daqing), and the No. 2 field, Shengli (Xengli), did passably well. However, Takang (Dagang), the No. 3 oilfield that was damaged by the mid-1976 earthquake, was still struggling to resume its normal expansion schedule. The Panshan oilfield between Chinchow (Jinzhou) and Yingkou was being developed into an important chemical raw material base. The new Renchiu or Huabei (means Northern China) field may soon be surpassing Takang and Panshan in importance, in view of the many high-yield wells reported. In Xinjiang, the Karamai field upped production somewhat; possibly more important, however, is that an extensive new field has been discovered in western Xinjiang. Qaidam Basin of Qinghai also holds the promise of large production. A very significant oilfield was being developed in southern China near Samsui close to Guangzhou (Canton).

China's oil output is about one-fourth the U.S. level, but prospects of greatly expanded production are excellent. There is growing evidence that China's crude oil output will top 150 million tons by the early 1980's and over 200 million tons after the mid-1980's. Overall reserve estimates are getting higher as more new fields are mentioned in the press. Secretary Schlesinger of the U.S. Department of Energy, after visiting China in 1978, placed reserves there at 100 billion barrels (7.4 barrels equal 1 ton), conservatively compared with what the Chinese think themselves. China's oil industry is clearly on the rise, with additional reserves found in existing oilfields, intensive drilling done to prove up new fields, and determination that much more unexplored sedimentaries hold promise for fossil fuels. At Taching, there are reports of improved technology, new finds, and additional production horizons. At Shengli, the slogan is to catch up with Taching (possibly 50 million tons per year) in 3 to 5 years. The Jenchiu or (Renchiu) field, proved up only a few years ago, holds such promise that large exports are planned to be made therefrom. Xinjiang's new Kashgar-Agsu field apparently has Soviet-type light oils. The oil- and gas-bearing Tsaidam (Qaidam) inland basin reportedly is as large as England, with extensive coalfields and saline deposits as well. The Ordos Basin, just south of Mongolia, may be another of China's major oilfields of the future. Offshore developments are occuring at a rapid pace.

The Chinese feel that the United States has the best technology on offshore oil. At least nine U.S. companies visited China during 1978 to discuss development of offshore and nearshore oil, particularly in the South China Sea. These are the Pennzoil Co., Exxon Corp., Union Oil Co. of California, Standard Oil Co. (Indiana), Phillips Petroleum Co., Mobil Oil Corp., Atlantic Richfield, Caltex Petroleum Corp., and Natomas Co. The national oil companies of the United Kingdom and France, Royal Dutch Shell, and Italian and Norwegian oil officials have also held preliminary discussions with the Chinese. In 1979, most of these companies were granted seismic survey rights to search for oil offshore.[61] Prospecting and development work in Pohai (Bohai) Bay went mostly to the Japanese, who negotiated the concept that China will bear some of the exploration risk. The Japanese would initially finance the projects, with the Chinese paying their share with future oil. Actually, the Japanese have great respect for Chinese knowledge of continental-origin oil deposits and feel that the offshore areas of Pohai could yield a minimum of 30 million tons per year of oil. The Japanese will also work in the Pearl River Delta onshore and offshore near Canton. Most Asian analysts and oil specialists feel that China's offshore reserves can eventually support annual production of more than 100 million tons of oil.

Chinese exports of oil in 1978 reached perhaps just over 12 million tons, valued at $1 billion plus. Exports in 1979 were nearly the same, but prices were considerably higher. Japan continued to be the primary market, receving roughly 7 million tons of crude oil in 1978. Shipments to North Korea were at most 1.5 million tons (capacity of pipeline) during 1978, with the Koreans paying low prices for Chinese oil from Taching. Shipments to the Philippines, mainly from Shengli, were perhaps 1 million tons in 1978; future contracts indicate 1.2 million tons per year of crude, basically in exchange for copper concentrates. Hong Kong received about 900,000 tons of oil products from China in 1977 and possibly 20% more in 1978. Thailand had been importing about 0.5 million tons per year but signed a 5-year contract on January 14, 1979, to obtain up to 1 million tons per year of Chinese crude oil. Romania has a barter agreement to acquire roughly 0.5 million tons per year in exchange for Romanian fertilizers. Brazil has entered the picture by agreeing to take about 1 million tons of crude oil in 1979 and 1.5 million tons in 1980 in exchange for iron ore and secondarily, pig iron. The Chinese hope to sell much more oil in the long term, to help pay for their industrialization and modernization programs.

The Taching oilfield, between Anta and Fuyu in Heilongjiang Province, has been by far China's biggest. Like most producing fields in China, its oil is high in wax, low in sulfur, and continental in origin. Taching's production has reached about 50 million tons per year of crude oil, possibly close to its potential peak. Recent efforts have been directed toward finding more reservoirs around the fringes and looking for oil at depths exceeding 3,000 meters. Most oil now comes from depths of less than 1,500 meters, but reserves in deeper horizons may be as large as those in shallow formations. Oil recovery is presently about 30%, compared with future hopes of 50% or greater. Taching has facilities to refine 10% to 15% of the crude produced, plus two large fertilizer plants and petrochemical units. Technology is stressed, as witnessed by the 450-member Oil Extraction Research Institute attached to the oilfield. Reportedly, reservoir pressures have been steady, most wells maintain natural flows (95% of the original wells are still utilized), production levels have not declined even for old wells, and the early water injection technique is an unqualified success.

Shengli, comprised of more than 20 smaller oilfields in the Yellow River Delta, covers 10,000 square kilometers. It was far more faulting than Taching, although not as much as Takang. The many faults have cut up the reservoirs and caused mixing of water, oil, and gas. Nonetheless, reserve and operational problems have been overcome, and the hope is to double production from the present roughly 25-million-ton-per-year level in 5 years. As of early 1979, Shengli had about 100,000 workers, up to 200 operating rigs, and some 6,000 individual producing wells. Three medium to poorly consolidated sands, lying mostly between 1,100 to 1,700 meters but reaching twice that depth near fault blocks, provide most of the production.[62] The deepest well was about 5,000 meters. Shengli has a refining capacity of about 6 million tons per year, two fertilizer plants, downstream plants, a petroleum institute, and many kinds of basic industries nearby. A new oil industry complex was being built 80 kilometers to the west. A major network of pipelines passing through Tzupo coal mines and the port of Qingdao has now been extended all the way to Nanking (Nanjing), 1,000 kilometers away. Shengli oil already goes to Japan, the Philippines, the Maoming refinery north of Canton, and many other markets.

The true potential of the Takang (Dagang) oilfield, located nearshore Pohai Bay about 60 kilometers southeast of Tianjin, has not been further clarified. It has been compared with Taching and Shengli, but production definitely is much lower, and structures, much more faulted and folded. Takang's past peak output may have been 10 million tons per year, and some believe it is much lower. However, Takang apparently has good reserves of gas, which have already been piped to Peking and Tianjin. Recent visitors say that Takang has about 60 drilling rigs and 80 production stations working in the "salt flat," and several offshore rigs in Pohai Bay. The Panshan field to the northeast and near the south of the Liao River was said to be not only rich in oil but also in natural gas, sea salt, and boron and magnesium salts.[63] The Liao River area has a large fertilizer plant capable of producing 300,000 tons per year of ammonia and 480,000 tons of urea. A new plastics plant is being built in nearby Yingkou. Panshan's crude oil output may have been somewhat stabilized at the 6- to 8-million-ton-per-year level.

In 3 years, since drilling began in 1975, the Huabei oilfield centered in Jenchiu County south of Peking, has already been developed into an oilfield capable of supporting the needs of the Peking Tungfanghung refinery, which is rated at close to 7 million tons per year. The Huabei field has more than 10 high-yield wells producing in excess of 1,000 tons per day each, and this is just the beginning. Specifically, the No. 11 well reportedly produced 2.6 million tons of crude during the 2 1/2 years of its existence.[64] The No. 4 well, located in the Guchienshan area, was said to be of great geological significanc, because oil occurs in carbonaceous formations of the Sinian in the Paleozoic era, rather than in later rocks such as the Mesozoic and Cenozoic. Such formations are found widely elsewhere, including Jiangsu and Zhejiang Provinces and many other areas along the Yangtze River. Indeed, the brand new Subei field in southern Shandong and northern Jiangsu may be of this nature. Huabei employs early water injection and acidification of oil-bearing formations. Two large pipelines, totaling 200 kilometers, and two large pumping stations were quickly installed. Overall output has risen sharply, with targets overfulfilled. Also, new reservoirs have been discovered around the perimeters. The Luning Pipeline, connecting Shengli and Huapei oilfields with Nanking and elsewhere and to the south, was recently completed. Technically, the oil is more like that of Taching than that of Shengli but with higher sulfur, water, and nitrogen contents, according to the Japanese.

Xinjiang's Karamai oilfield in western Dzungarian Basin may be producing about 7 million tons per year crude. Its downstream facilities have been streamlined somewhat, and a new refinery has been built at Urumchi. A railroad that would eventually link southwest Sinkiang via Urumchi to China's east coast was started. Recent discovery of a large oilfield in the western edge of the Tarim Basin (Takla Makan), between Kashgar and Aksu, led to the decision to build this railroad through the desert. High-grade coals have also been found in large quantities, along with a "sea of oil" and iron, copper, and lead.[65] The southern Xinjiang field is expected to top Karamai's output by far and become one of China's future Tachings. Moreover, the oil is light, nonwaxy, and "conventional." In 1979, negotiations were apparently underway among China and Japanese and U.S. firms to develop jointly this oilfield at an initial cost estimated at $1 billion. There are great difficulties in developing such an oilfield 3,000 miles inland.

China has investigated onshore and nearshore areas of Guangdong Province for oil, with considerable initial success. One major find is the Samsui Basin in the Pearl River estuary near Canton, which may extend all the way to the sea. A recent report states that preliminary investigations had been completed for the Samsui Basin, three successful oil and gas wells had been drilled, and oil flows were seen in two additional areas.[66] The Japanese visited Samsui in mid-1978 and indicated that the oil was high-quality, light crude of 32.5°C pour point, 39% lighter fraction, 0.05% sulfur, 0.04% nitrogen content, and 43% API gravity. Significant deposits of oil have also been found on the Leichow (Liuchow) Peninsula, the Chiungchow Straits north of Hainan Island, and offshore southwest of Hainan in the Tonkin Bay. Reportedly, Guangdong Province will be greatly industrialized by 1985 to include a large oilfield in the South China Seas area, two petrochemical bases, one chemical mineral raw material base, six coal bases, six or seven medium to large powerplants, two medium-size steelworks, three iron ore bases, one nonferrous metal base, two shipbuilding bases, and four rail lines.[67]

China's natural gas production continues to move up sharply, in 1978 registering about a 10% increase over that of 1977, compared with a growth of 22% a year earlier. There is some question as to the production level of natural gas in China. However, output in 1979 may have surpassed 100 billion cubic meters, possibly one-fifth of U.S. production and one-fourth of Soviet production. Sichuan Province is to gas as Taching is to oil, and its gas output has risen more than sixfold in the last 15 years. Gas is widespread in the Province, which is crisscrossed by over 1,000 kilometers of pipelines and split into five natural gas districts with hundreds of gas-oil structures. Luchow (Luzhou) in southern Sichuan, with hundreds of wells and over 300 kilometers of pipelines connecting markets, is one of the best gasfields. One of the better wells here has produced 1.6 million cubic meters per day. Most Sichuan wells are more than 4,000 meters deep, with the deepest at over 7,000 meters, and are reportedly drilled with artificial diamond bits produced in China. Most of Sichuan's basic industries, like fertilizers, steel, power, salt, and cement, are run by gas. Chengdu even uses gas for fueling some buses that are equipped with gas bags on top. This gas is also sent to southeast China via pipeline.

Natural gas is also plentiful in the Tsaidam (Qaidam) Basin, which, however, does not have much in the way of local markets. The Takang oilfield has much natural gas, which already goes to Peking and Tianjin. Efforts to sell liquefied natural gas (LNG) from Takang to Japan have not been successful as yet. Petroleum gas and natural gas are also associated with many other oilfields around the country. Liaoning Province has done well in developing and utilizing natural gas, with output brought up to 1.5 billion cubic meters per annum, or 40 times the 1970 level. Origin of this gas might be the Panshan-Yinkou field. The gas is important in furnishing raw material for the 15 fertilizer plants of various sizes in the Province.

Oil Shale.—Maoming (Mowming) in Guangdong, with China's largest oil shale operation, expanded its general industrial facilities. Natural oil and gas have been found about 200 kilometers to the northeast and 100 kilometers to the southwest, and construction has begun on a railroad between the new Samsui oilfield and Maoming. The 140-kilometer pipeline connecting Changjiang brings in oil from distant places like Shengli and Iran. Maoming's regular oil refinery, rated at 5 million tons per year, is scheduled to be doubled in capacity by 1985. The lubricants plant is most modern, and there is the waste oil recovery plant. Maoming's oil shale operation, with six retorts and 1.5- to 2-million-ton-per-year capacity, may be working at a reduced scale. However, byproducts such as cement and rare minerals and metals are still produced. Maoming's technical personnel have also participated in oil development activities in the South China Seas. China's second largest and older oil shale operation, Fushun in Liaoning Province, seems to be phasing out because of the large quantities of natural oil brought in to support the conventional refinery. Fushun's famous open-cut operations are literally going underground, making the oil shale sitting on top of the coal increasingly difficult to extract. Output of shale oil from

Fushun in 1978 and 1979 probably dropped below 0.5 million tons, which is less than one-third the original capacity.

China is accelerating its efforts to build pipelines, ports, and vessels to ship oil and gas. There are nearly 7,000 kilometers of trunk pipelines at present (excluding local gas lines in Sichuan and elsewhere). China produces mostly 20- to 30-centimeter-diameter welded pipes and imports mainly 61-centimeter pipes. The need for seamless pipes is so great that the Chinese are considering investing in pipemaking facilities in Japan. The newest major pipeline connects the Shengli and Huabei oilfields with Nanking, 1,000 kilometers to the south. Previously, Taching had already been connected with Chinhuangdao and Peking via Tiehling, and separately to Dalien (Luda) and North Korea. Plans are being made to build a big depot in Dalien to facilitate exports. Another long pipeline is from Sichuan to the east coast. A 1,000-kilometer pipeline extends from Koerhmu to Lhasa at the southeastern tip of the Tsaidam Basin. A short (140-kilometer) but important pipeline has been built from Chanjiang to Maoming in Guangdong.

China's oil refinery and petrochemical facilities were being expanded at a pace commensurate with the increase in crude production less exports and direct domestic consumption of crude. All indications are that the country's oil-refining capacity may be as much as 90 million tons per year as of early 1979. The Chinese reported that as of the fall of 1978, national oil-refining capacity had increased nearly 400% in a decade, which means that the increment is likely to be in excess of 60 million tons per year.[68] They also report that 57.5% of the increase came from buildup of old refineries and that this buildup is equivalent to adding over 12 refineries of 2 to 3 million tons per year each. Innovations have also helped to improve product quality and variety. China's old refineries are basically of two types—an "ESSO" type of about 2.5 million tons per year and a Soviet type of up to 2 million tons per year; one or more of these basic units can be constructed wherever necessary. The Chinese claim that their high-wax crudes are good as raw materials for cracking.

The Mineral Industry of Colombia

By Orlando Martino[1]

Colombia's economic recovery gained impetus in 1978 and 1979 relative to the recession of 1975. The gross domestic product (GDP), estimated at $21.3 billion[2] at current prices, grew in real terms by 8% in 1978, compared with the 6% growth rate in 1977, while the rate of inflation was reduced to 18%. Preliminary data indicate that the economy grew by 6% in 1979, but the inflation rate increased to 28%.

The mineral industry of Colombia was dominated by the production of crude petroleum, natural gas, and coal. Except for iron ore, gold, and platinum, the production of metallic minerals was limited. Colombia continued as a major gold producer in Latin America and as a significant world producer. Among nonmetallics, Colombia was the world's leading producer of emeralds and a significant Latin American producer of salt and cement.

During 1978 and 1979 Colombia proceeded with programs to exploit its potential in petroleum, natural gas, coal, and nickel. The Empresa Colombiana de Petróleos (ECOPETROL) entered into additional association contracts with foreign companies for oil exploration and increased its own drilling program. Work progressed on the feasibility study for the El Cerrejón coal deposit, and negotiations were completed on financing for the Cerro Matoso nickel project. There was also some progress on initial steps to develop Colombia's new discoveries of copper and phosphate rock deposits. Uranium exploration activities progressed satisfactorily. The Ministry of Mines and Energy announced the discovery of a significant deposit of bauxite in Arauca in 1978.

In April 1979, Colombia was granted a $600 million loan from a consortium of foreign banks led by the Chemical Bank of New York. Of this amount $200 million would be allocated to ECOPETROL for capital investments in oil refining, development, and exploration.

In August 1978 President Julio Cesar Turbay took office and by yearend had made no drastic change in economic policy. Emphasis continued on curbing inflation and promoting regional economic decentralization. As a member of the Andean Pact, Colombia was not actively seeking foreign investments in most sectors of the economy, particularly in commerce and finance. However, a favorable investment climate existed for potential investors in mining, petroleum, and export industries.

According to the U.S. Bureau of the Census, U.S. direct foreign investment in Colombia increased from $653 million in 1976 to $706 million in 1977, the first substantial increase since formation of the Andean Pact. U.S. investment in petroleum in the same period increased from $56 million to $71 million. The increase in petroleum activities was stimulated by the Government decision in 1976 to change its petroleum pricing policy for new and incremental crude oil production.

Decree Law No. 1620 of 1978 was promulgated, the second important reform introduced in the Mining Law - Decree 1275 of 1970. The first reform appeared in Decree 2181 of 1972. The 1978 reform simplifies the procedures for requesting a license for exploration and obtaining a concession and expedites the release of the zone covered by the license. Another important change specifies that a right of way cannot be exercised until the miner pays the corresponding indemnification to the private property owners.

Table 1.—Colombia: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
METALS				
Chromite, gross weight	5,000	5,000	5,000	5,500

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the commodities listed, coal briquets are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[2]Data may not be comparable to those given for prior years because of a change in methodology for gathering production statistics that was initiated by the Ministry of Mines and Energy in 1979 and which affected data collected on 1978 output.

[3]U.S. imports, largely moralla and gangue but also including some gem-quality emerald.

[4]Data represent total Colombian exports.

PRODUCTION

Colombia's limited production of commodities is given in table 1. Output of iron ore declined slightly. However, steel output increased significantly but was below the peak year of 1972 and then declined in 1979. As for precious metals, in 1978 there was a slight decline in gold production, and a significant drop in output of silver and platinum.

Among nonmetallics, cement production rebounded to a historic high in 1978 and 1979. Output of rock and marine salt declined. Of the mineral fuels, production of coal and natural gas increased to new highs in 1978 and 1979, while output of crude petroleum continued its downward trend.

TRADE

Expansion of Colombia's international trade continued in 1978 and 1979. However, mineral and mineral-related commodities remained a small part of overall trade, which continued to be dominated by coffee exports. In late 1979 the Director of Colombia's fund for the Promotion of Exports (PROEXPO) announced that during the next 5 years special emphasis would be given to exports from the mining sector within Colombia's long-term policy of export diversification.

According to figures of the Banco de la Republica for 1978, Colombia's trade deficit widened to $471 million: while total registered exports increased 27% to $2.94 billion, registered imports increased 28% to $3.41 billion.

For the yearly data available, Colombia's limited mineral exports are shown in table 2, and the mineral imports in table 3. The leading mineral export in 1978 was fuel oil valued at $127 million, followed by emeralds at $40.7 million, portland cement at $38.3 million, mineral ores at $11.1 million, and platinum at $2.5 million. The value of platinum exports rose sharply in 1978 by almost 200% owing primarily to increases in world prices.

Imports of crude oil declined slightly to 24,200 barrels per day because of price increases. The total value of crude oil and refined products imported in 1978 reached $243 million, some 30% above 1977. Colombia continued to rely on imports to meet its demand for certain steel products and nonferrous metals, especially aluminum, copper, lead, and zinc.

As part of its international trade policy, Colombia's adherence to the General Agreement on Tariff and Trade (GATT) was announced on December 21, 1979, by the Director of the Instituto Colombiana de Comercio Exterior (INCOMEX).

On January 31, 1979, the Minister of Mines and Energy issued Resolution No. 00088 on the requirements that must be complied with in order to obtain customs duty exemption on imports brought into Colombia specifically for the mining industry.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—The Institute of Geological and Mineral Investigations (INGEOMINAS), a dependency of the Ministry of Mines and Energy, reported proved bauxite reserves of 400 million tons in the Intendencia de Arauca situated northeast of Bogota and south of the Venezuelan border. The bauxite deposit has an average grade of 38% Al_2O_3. The State mining company, Empresa Colombiana de Minas (ECOMINAS), was planning to carry out further studies.

A minerals survey report of the United Nations on Colombia indicated that there are possibilities for Colombia to become one of the largest aluminum producers in Latin America. This industry would be based on Colombia's abundant reserves of coal, caustic soda, and hydroelectric power. Colombia continued to import all its aluminum ingot, principally from Venezuela.

Copper.—ECOMINAS announced in late 1979 that preliminary geological surveys indicate that a large copper deposit has been discovered in an isolated part of the Departments of Chocó and Antioquia. The Los Pantanos-Pegadorcito deposit was estimated to have reserves of 250 to 625 million tons of ore grading 0.7% to 1.2% copper. Colombian officials began talks with Amoco concerning a joint venture. Two other copper deposits were being studied in the same area at Murindo and Monde.

Assays for the newly discovered Alisales copper deposit in the Department of Narino indicate ore grade of 3% copper. Texasgulf Inc. and ECOMINAS were discussing a joint venture for Alisales.

Gold, Platinum, and Silver.—Since 1975, Colombia's gold production has dropped steadily. The 20% increase in gold output projected for 1978 did not materialize. The slight decline was caused by labor problems. Small and medium miners increased their share of total production to 70%. The share of production by the large-scale companies has been droppping since 1965. The Departments of Antioquia and Chocó accounted for about 90% of Colombia's output in 1978. In April 1978, the Junta Monetaria de Colombia made both the domestic and the export price for gold equal to its world price, as part of an international agreement. Since 1972 no gold has been exported.

Platinum and silver output declined significantly. The rebound in output of platinum in 1977 proved to be short lived, and the downtrend since 1973 was resumed.

Iron Ore.—Colombia's total iron ore resources have been estimated at 535 million tons, including reserves of 235 million tons, a third of which has an iron content of about 48%.[3] The balance of the reserves has an iron content ranging from 22% to 32%. The higher grade ore deposits lie near Socha within 30 kilometers of Paz del Rio, site of Colombia's major steel center. Since these iron deposits have a high phosphorus content, the steel plant uses the Thomas Bessemer converter process for steel production instead of the more widely used hearth method.

A smaller iron ore deposit with grades of up to 58% iron content is located in Sopó near Bogota. This deposit supplies a pig-iron producer, Colombiana de Arrabio S.A. (COLAR), with 40,000 tons per year of low-phosphorus pig iron. The output covers needs of local foundries and a surplus for export.

Iron and Steel.—Production of crude steel by Acerias Paz del Rio S.A. (APR), Colombia's major integrated producer and the largest privately held corporation, rebounded from the depressed level of 1977 to 265,200 tons but was below the peak output of 1972. APR accounted for 28% of Colombia's apparent consumption of finished steel products, while Colombia's six semi-integrated steel companies accounted for 17% and imports represented 55%. APR's net profit in 1978 reached a historic high at almost $10 million.

APR proceeded with its project to expand its plant to a capacity of 400,000 tons of steel per year under engineering consultation with Creusot-Loire Entreprises, patent holder of the Loire-Wendel-Sprunck (LWS) system. In November 1978 an agreement was signed with Linde A.G. of Germany for the oxygen plant for injecting oxygen in the blast furnaces. APR's expanded capacity was expected to be available by mid-1980 and would supply higher quality steel. The project also contemplates expanded output of iron ore, coal, and limestone. Colombia has ample reserves of the basic raw materials for steelmaking.

Colombia's six semi-integrated steel plants, using scrap as an essential input, operated at only half of their capacity of 240,000 tons per year of crude steel ingots, owing to shortages in domestic steel scrap and difficulties in transporting imported scrap from ocean ports to the steel plants. Siderúrgica del Pacifico S.A. (SIDELPA) in Cali was the largest semi-integrated producer with a capacity of 60,000 tons of crude steel.

Four semi-integrated steel companies have sponsored a feasibility study for a sponge iron plant to utilize high quality imported iron ore pellets in a direct reduction process. The Caribbean port of Cartagena was being considered as the plant site. The proposed $75 million plant would use natural gas from the Guajira gasfields once the existing gas pipeline from these fields is extended from the port of Barranquilla. The Guajira fields, with proven reserves of 5.5 trillion feet, had a production capacity of 200 million cubic feet per day in 1979. The proposed plant would require only 6% of the current potential yield of the Guajira gasfields.

Nickel.—The joint venture comprising Cerro Matoso S.A., incorporated in March 1979, was restructured to include the Empresa Colombiana de Niquel (ECONIQUEL)- 45%, Compania de Niquel Colombiana (CONICOL) - 20%, and Billington Overseas Ltd. - 35%. ECONIQUEL is a subsidiary of state-owned Instituto de Fomento Industrial (IFI), and CONICOL is a joint venture of the Hanna Mining Co. and Standard Oil of California (SOCAL) which contributed to the discovery of the Cerro Matoso deposit in 1956. Subsequently SOCAL transferred part of its mining rights to IFI and Hanna. Billington, a subsidiary of Royal Dutch Shell, entered into a 12-year contract to buy all the ferronickel produced by Cerro Matoso.

The Cerro Matoso open pit operation to be located near Montelibano, Department of Córdoba, south of Cartagena, will have a crushing plant, a dryer, a smelter (electric furnaces), a natural gas pipeline, a river wharf, and other support facilities to produce 50,000 tons of ferronickel with a nickel content of 37.5%. Construction work was initiated in late 1979, and startup was scheduled for early 1982. The $340 million project will be financed by the original $100 million capitalization of the three partners, a commercial bank consortium led by Chase Manhattan ($120 million), the World Bank, and the U.S. Export-Import Bank (EXIMBANK). A portion of the financing was obtained in November 1978 when EXIMBANK agreed to extend a $25.6 million credit to Cerro Matoso S.A. In October 1979, the World Bank approved its loan of $80 million.

The three areas of mineralization of the Cerro Matoso deposit with proven reserves of 19.5 million dry tons will be exploited in three stages as indicated in table 4. Overall Colombia's lateritic nickel deposits are estimated at 88 million tons of ore, broken down as follows: 25 million tons with a nickel content ranging from 1.5% to 3.2%, some 40 million tons with a nickel content ranging from 1.0% to 1.5%, and marginal deposits of about 23 million tons ranging from 0.5% to 1.0% nickel. The Cerro Matoso deposit, the most important one, is included in these figures.

When full production is reached in 1985 at 60,000 tons per year of ferronickel, exports would yield about $200 million in additional export revenues and assist Colombia's export diversification goals.

Table 4.—Colombia: Cerro Matoso nickel reserves and development stages.

Area	Approximate life (years)	Reserves (dry metric tons in thousands)	Percent				
			Nickel	Iron	SiO_2	MgO	Ignition loss
Stage I	9	7,060	3.20	13.8	47.5	14.8	9.1
Stage II	7	5,252	2.72	13.2	45.9	17.4	9.6
Stage III	9	7,175	2.22	18.8	41.6	12.9	9.6
Total	25	19,487	2.71	15.5	44.9	14.8	9.4

Note: The total ore reserve corresponding to Stage III amounts to 12,655,000 dry tons with an average nickel content of 2.22%. In addition there is a deposit of 41 million dry tons with an average grade of 1.51% nickel.

NONMETALS

Cement.—Exports of portland cement valued at $38.3 million in 1978 continued to figure significantly among Colombia's total exports. In March 1978 Acerias Paz del Rio signed a $21 million contract with the Japanese firm of Kawasaki-Marubeni for the engineering, equipment, and installation supervision for a cement plant near the Belencito steel plant in Sogamoso. The cement plant will utilize slag from the blast furnaces of the steel plant for an output of 600,000 tons per year of cement and was scheduled for startup in mid-1980.

Fabrica de Cemento Samper was extending its La Calera plant near Bogotá. Cementos del Caribe S.A. in Barranquilla was expanding its wet process plant for operation in 1980.

Emerald.—Exports of about 894,900 carats of emerald increased to $40.7 million in 1978 compared with $6.5 million in 1974. In 1977, Colombia exported 484,500 carats of emerald valued at $27.5 million. The increase reflected the return to stability in the Muzo, Coscuez, and Peñas Blancas mines following a period of violence and disorder in the gemfields owned by the state. The main export markets were the United States, Japan, and the Federal Republic of Germany.

Production continued at the Chivór mine in Almeida, Boyacá, the largest privately owned emerald mine in Colombia. Under 5-year renewable contracts, the Muzo Mine was operated by the Sociedad Minera Boyacense, the Coscuez Mine by Esmeraldas y Minas de Colombia S.A. (ESMERACOL), and Peñas Blancas by Hermanos Quintero Morales-all private companies headquartered in Bogotá.

By Decree Law No. 1411 of July 1978, ECOMINAS, which had operated the state-owned mines from 1970 to 1973, was given control of the domestic and foreign marketing of emerald and other gem stones, a function previously exercised by the Ministry of Mines and Energy.

Fertilizer Materials.-*Phosphate.*— ECOMINAS was evaluating proposals for a feasibility study of a $70 million phosphate mining and fertilizer operation at Pesca in the Department of Boyacá and Sardinata in Norte de Santander. The study contract was expected to be signed in mid-1979.

Salt.—Colombia was the third important producer of salt in Latin America after Mexico and Brazil. All salt mines, such as Zipaquirá and Nemocón, and marine salinas along the Caribbean coast of Guajira Peninsula are the property of the national Government. The Banco de la Republica, Concesion de Salinas, exploited the salt deposits under agreement with the Government. In 1978 Colombia produced 167,200 metric tons of soda ash (sodium carbonate) compared with 140,600 tons produced in 1977; 1979 output declined to 140,000 tons.

MINERAL FUELS

Colombia proceeded with its 10-year plan announced in 1976 to expand its energy resources, particularly coal, natural gas, and hydroelectric power. Self-sufficiency in petroleum output was planned to be attained in 1985.

A Colombian National Alcohol Committee, chaired by ECOPETROL, was established in 1979 to promote selective investment in depressed agricultural areas (including the Guajira) for growing yucca, potatoes, and sugar cane which could be converted into alcohol for a gasohol mixture. A national symposium in alcohol was planned for March 1980.

Coal.—The Congress of Colombia was studying a proposed bill to reform the code for coal mining. The bill would modify the basis for holding coal concessions in order to expedite exploitation of coal lands. A 5% production tax on coal was also proposed, to be used in part to set up a Fondo Nacional del Carbon charged with improving the transportation infrastructure in coal areas and to assist small and medium coal companies.

Production of coal in 1978 increased 17% to a historic high of almost 5 million tons compared with 2.5 million tons produced in 1970. But output was not sufficient to meet domestic demand and not indicative of Colombia's large potential. Output from the coal washing plant at the Paz del Rio steel complex increased 19% to a high of 612,000 tons. Although coal exports have increased greatly since 1954, the amounts have been modest. Exports of 85,800 tons in 1975 went mostly to Venezuela, Brazil, and Peru.

Planning was underway to increase coal output to serve a number of investment projects in order to reduce dependency on fuel oil. The reduction process at the Cerro Matoso nickel project was expected to use 40,000 tons of coal per year. Expansion of steel capacity at the Paz del Rio steel complex will require expansion of APR's own coal mines. There were also plans to expand coal use in electricity generating and cement plants projected in table 5. In

Table 5.— Colombia: Projections of coal demand and exports

(Million metric tons)

Year	Production		Domestic demand				Exports

1977, only 12% and 15% of total output of coal were used respectively in cement and electric power generation. Since Colombia has the largest known coal resources in Latin America, it was expected to become a significant coal exporter by 1985.

Carbones de Colombia S.A. (CARBOCOL), a state-controlled company set up for coal exploration and development, proceeded with its project to develop the open pit mining stage of Area A of the El Cerrejón coal deposit in the Guajira Peninsula. International Petroleum Colombia Ltd. (INTERCOL), an Exxon Corp subsidiary, was completing the second year of exploration in Area B of El Cerrejón in an association contract with CARBOCOL. Studies were underway on the infrastructure required, especially the railroad link to a Caribbean port site to be selected. INTERCOL was also investigating potential Latin American and European markets for Colombian coal.

The El Cerrejón deposit contains an estimated 3.5 billion tons of low-sulfur and low-ash coal. Colombia's total coal reserves of 40 billion tons includes 7 billion tons of measured reserves, 10 billion tons of inferred reserves, and 23 billion tons classified as potential reserves. This represents 59% of Latin America's total reserves estimated at 68 billion tons.[4]

Natural Gas.—Unlike the continuing decline in output of petroleum, production of natural gas continued its upward trend in 1978 and 1979. The increase was owing to the startup of gas production from the Guajira Peninsula in mid-1977. The Guajira gasfield was expected to reach its maximum yield of 450 million cubic feet per day in 1982 - equivalent to some 700,000 barrels per day of crude oil. During 1978 there were no significant gas discoveries to add to the major increases in gas reserves obtained in the 3 prior years, primarily offshore from Cartagena and the Guajira. However, in early 1978 a gas discovery offshore of Galerazamba near Cartagena was confirmed with indications of potential reserves two or three times the 3.5 billion cubic feet estimated for the Guajira fields. Onshore, INTERCOL was developing the Coral field in the Jobo block of the Lower Magdalena Valley.

In 1979, Texaco and ECOPETROL contracted El Paso Co. to study the feasibility of building a liquefied natural gas (LNG) plant in the Guajira east of Santa Marta to process gas from the Guajira onshore and offshore fields. The El Paso study concluded that the LNG plant would not be economically feasible. Nevertheless, Guajiran gas was being sold to industrial users in Barranquilla and Cartagena and to electric utilities along the Caribbean coast.

Promigas S.A. initiated studies on extending the gas pipeline from the Jobo Tablon gasfield south to Cartagena past the Cerro Matoso nickel deposit to Medellin and Cali with a branch to Bogotá - thus bringing gas service to the major industrial and residential centers of Colombia.

At yearend 1979 Colombia's reserves of natural gas were reported at 5.0 trillion cubic feet.

Petroleum.—Production of crude petroleum, which averaged 130,800 barrels per day in 1978 compared with 137,600 barrels per day in 1977, decreased 5% for the eighth consecutive year since 1970 when output peaked at 218,000 barrels per day. In 1979, estimated production was at 125,000 barrels per day. The downward trend was projected by the Ministry of Mines and Energy to continue until 1982 when output would average only 89,100 barrels per day. Production of refined petroleum products, especially motor gasoline, also declined overall by about 5% in 1978, while output of diesel oil

rRevised.
[1]Operated the Orito field - Putumayo, owned 50% by Texaco and 50% by Petrorio del Rio (Petrorio). Petrorio in turn is owned 50% by ECOPETROL and 50% by Cayman International Corp. Texaco sold its share in late 1979.
[2] Exxon Corp. affiliate.
[3]Cities Service, ECOPETROL, Amoco, and ARCO each own 25%.

and fuel oil increased slightly.

The major part of production continued to come from old oilfields covered by concession contracts. The companies involved have been attempting to get the Government to increase the prices for old oil. As a consequence of price control, marginal wells with production of 30 barrels per day or less have been shut in as production costs exceed revenues. To increase recovery ECOPETROL drilled water injection wells in the Casabe and La Cira fields.

Consumption of petroleum products increased only 2% in 1978, averaging 175,000 barrels per day. Colombia spent $121 million in 1978 on imports of 8.8 million barrels of crude oil from Venezuela and Ecuador, compared with 9.4 million barrels imported in 1977. Imports of crude oil have been trending upward since 1974, the last year Colombia exported crude oil. Imports of refined products from Brazil and the Netherlands were valued at $123 million. On the other hand Colombia continued to export fuel oil (to the United States mostly) which in 1978 was valued at $124 million for 11.1 million barrels. For the first 9 months of 1979, Colombia exported 6.7 million barrels of fuel oil valued at $99 million.

In March 1979, the Government announced a number of petroleum conservation measures, including increases in fuel prices. Regular gasoline increased in price 23% to $0.48 a gallon, and the price of natural gas increased 10%. In July 1979, the price of regular gasoline was again increased 29% to $0.61 per gallon. Despite these adjustments, ECOPETROL continued to subsidize the retail sale of gasoline and diesel oil, thus jeopardizing its financial condition.

During 1978 ECOPETROL entered into 11 new association contracts with foreign companies, bringing the total to 27 contracts. In late 1979, Texaco sold all of its interests in the Putumayo oil-producing region, including the 310-kilometer trans-Andean pipeline, to its partner, ECOPETROL. The Orito field in this region, one of Colombia's major producers, was discovered in 1963 by Texaco in a joint venture with Gulf. Startup of the pipeline to the coast was in March 1969.

There was an increase in exploratory drilling in 1978, but there were no major oil or gas discoveries. Up to 1982 Colombia expects to spend $750 million on increased drilling activity. In that year 58 exploratory wells are programmed compared with the average of 19 exploratory wells drilled over the period 1970-1978. According to ECOPETROL, in 60 years of exploration, only about one-fifth of Colombia's prospective sedimentary basins have been explored. Colombian geologists believe that areas such as the Mirador formation adjoining productive regions in Venezuela may also be productive in Colombia. In addition, the areas of Arauca, Casamare, Vichada, and possibly Meta may have up to 2 billion barrels of oil. This is thought to be the western limit of the Orinoco heavy oil belt.

The plains (Llanos) of eastern Colombia have long been considered to have oil potential. In 1978 Aquitaine Colombia S.A. and Chevron Petroleum Co. of Colombia tested 1,600 barrels per day at the Trinidad field discovery in the region's Meta basin.

In 1978 Colombia's proved oil reserves increased 9%, from 779 million barrels to 850 million barrels, of which ECOPETROL has 219 million barrels.

Uranium.—During 1978 the Empresa Colombiana de Uranio (COLURANIO) was conducting studies relating to the introduction of nuclear energy production in Colombia in the 1990's. Under contract with the Instituto de Asuntos Nucleares de Colombia (IAN), Minatome of France and the Empresa National del Uranio (ENUSA) of Spain were proceeding with their exploration activities. These association contracts with IAN will eventually be taken over by COLURANIO, established in 1977.

The Mineral Industry of Cyprus

By David E. Morse[1] and Candice Stevens[2]

Since 1974, the island of Cyprus has been divided into a northern sector controlled by the Federated Turkish Cypriots and a southern sector controlled by the Government of Cyprus. The information in this chapter concerns primarily the southern sector since no data were available on the northern sector.

The mineral industry contributed nearly 13% to the gross domestic product (GDP) of $1.3 billion[3] in 1978 and an estimated 12.5% to the 1979 GDP of $1.44 billion. The production of nonmetallic minerals has generally increased owing to higher demand in the local construction industry and export demand for asbestos. However, metal production has declined as a result of the closure of mines during the 1974 conflict and low world market prices. Mineral contribution to both GDP and export value has evidenced a steady decrease in real terms since 1974.

Cyprus' mineral industry was comprised of mostly private companies with the Government holding a small interest in petroleum refining. The Geological Survey Department was responsible for the investigation of groundwater and the conduct of mineral exploration. The Mines Department was responsible for the inspection of mines, issuance of prospecting permits, and mining safety and technical assistance.

PRODUCTION AND TRADE

There was very little overall change in the Cyprus mineral sector in 1978 and 1979. Asbestos, cement, and chromite output increased slightly. Output of copper concentrate, gypsum, pyrite, and lime was somewhat lower than the 1977 production levels. Mineral production statistics are given in Table 1.

Cyprus' balance-of-trade deficit continued to increase from $366 million in 1977 to $416 million in 1978 and $566 million in 1979. Major mineral export earners were cement, asbestos, copper concentrates, pyrite, chromite, and mineral pigments (umber and ochre). Minor mineral export earners were gypsum, salt, and clay minerals. The principal destinations were Western European countries with the United Kingdom as Cyprus' largest trading partner. The European Economic Community (EEC) was the country's largest supplier of imports. Petroleum imports were valued at $85.1 million in 1978 and $124.7 million in 1979 and represented 14% and 12.4% respectively of total material imports.

COMMODITY REVIEW

METALS

Chromite.—Hellenic Mining Co., Ltd's (HMC) two major chromite mines were located in the Troodos Mountains and had a combined production capacity of 40,000 tons per year of ore. The bulk of production came from the Kokkinorotsos mine and the remainder from the Kannoures mine. Ore was beneficiated at the treatment plant located at Aylos Nikolaos. Chromite exports totaled 10,972 tons in 1978 and 10,530 tons in 1979.

Copper.—Copper production has evidenced a slow decline from the levels of previous years as mines have closed owing to civil conflict and low metal prices. Cyprus Island Division, a subsidiary of Cyprus Mines Corp. (CMC), ceased producing copper concentrate, cement copper, and precipitated copper in 1974. Its mines at Mavrovouni, Skouriotissa, and Aplika were previously the largest copper producers in the country. In 1977, Kampia Mines Ltd. ceased mining operations at its open pit mines at Peristerka and Pitharochoma. It previously mined 15,000 tons per year of ore and produced copper and zinc concentrates.

HMC accounted for about 60% of production in 1978 and 1979. It operated a number of small mines in the Troodos Mountains with the major part of production coming from the Kalavasos, Nitsero, and Parekklishia leases. Total production capacity was estimated at 30,000 tons per year of copper concentrate.

Cyprus Sulphur and Copper Co. Ltd. accounted for the remainder of production. Reserves at the Limni mine, located in the west near Polis, were estimated at 2 million tons grading 1.1% copper.

Exploration for copper mineralization continued by Noranda Exploration (Cyprus) Ltd., a subsidiary of Noranda Ltd. (Canada). It was reported in 1978 that the economic potential of substantial reserves of copper sulfide ore was under investigation. The Geological Survey Department was to undertake mineral surveys in conjunction with the United Nations Revolving Fund beginning in 1978. The focus was to be on chalcopyrite ore in a 1,4000-square-kilometer area.

NONMETALS

Asbestos.—Cyprus Asbestos Mines Ltd. mined approximately 5 million tons of rock and produced nearly 35,000 tons of long-fiber and short-fiber chrysotile asbestos in both 1978 and 1979. Approximately 95% of production was exported to Western European countries. All asbestos production came from the Amiamlos mine in the Troodos Mountain region. Cyprus Asbestos Mines Ltd. was planning the construction of a plant for the production of asbestos cement products at Limassol. Asbestos exports of 28,875 tons in 1978 and 38,489 tons in 1977 were valued at $10.6 million and $15 million, respectively.

Cement.—Cyprus produced over 1.1 million tons of cement in 1978 and 1979. Exports of over 600,000 tons, went primarily to Syria and other Arab countries. Cement production capacity of the country's two plants was 1.2 million tons per year. The Cyprus Cement Co. Ltd. plant, owned by this Galatariotas Group, began production in the late 1950's and has attained a capacity of 450,000 tons per year. The plant operated by the Vassiliko Cement Works Ltd., a subsidiary of HMC, began operating in 1967 at an initial capacity of 180,000 tons per year and has attained a capacity of 750,000 tons per year. Extensions to the facility were to increase its capacity to 1.2 million tons per year by 1981.

Fertilizer Materials.—Hellenic Chemical Industries Ltd., a subsidiary of HMC, planned to establish a domestic fertilizer complex at Vassiliko. Annual production capacity of the facility was to be 180,000 tons of sulfuric acid, 150,000 tons of complex fertilizer materials, and 40,000 tons of phosphoric acid. The sulfuric acid unit, which was to use locally produced iron pyrites as feedstock, was to be constructed by the Soviet firm Techmashimport. The phosphoric acid unit, which was to use imported Syrian phosphate rock, was contracted to the West German firm Lurgi. Cyprus imported a variety of manufactured fertilizers valued at $5.2 million in 1978 and $10.4 million in 1979.

Gypsum.—Total production capacity of the private firms that operated gypsum quarries in the area north of Vasilikos and Larnaca was about 100,000 tons per year. The largest producer was United Gypsum Ltd., a subsidiary of HMC. Production capacity of its quarry in the Psematismenos area was 70,000 tons per year. The Peletico Ltd. quarry near Larnaca had an annual production capacity of 10,000 tons per year. The foremost among several smaller producers was Limassol Chemical Products

Ltd., which produced about 1,000 tons per year of gypsum for use in local plaster production.

Mineral Pigments.—Cyprus exported nearly 10,500 tons of iron oxide pigments in 1978 and 10,219 tons in 1979. Production consisted primarily of umber and yellow ocher, but Cyprus also possessed reserves of terra verte and sienna. Most of the umber and ocher pigment deposits of Cyprus occur in the Cretaceous sediment of the Perapedhi Formation at localities scattered around the Troodso Massif and the Troulli Inlier. The principal producers of mineral pigments were A.L. Matovani & Sons Ltd., Messrs. Zenon Peirides & Sons Ltd., and Cyprus Umber Industrial Co. Ltd., all headquartered in Larnaca.

MINERAL FUELS

Petroleum.—The Cyprus Petroleum Refinery Ltd. facility at Larnaca on the island's southern coast continued to operate at less than capacity of 16,000 barrels per day in both 1978 and 1979. The oil refinery was owned by Shell Oil Co. (25.5%), British Petroleum Co. Ltd. (25.5%), Mobil Oil Co. (34%), and the Cyprus Government (15%). Most of the imported crude oil treated by the refinery came from Iraq in both 1978 and 1979 with lesser amounts supplied from Algeria, Libya and Saudi Arabia.

The Mineral Industry of Czechoslovakia

By Tatiana Karpinsky[1]

Czechoslovakia has large reserves of coal, lignite, antimony, magnesite, mercury, uranium, graphite, kaolin, and other clays, glass sand, limestone, and building materials, but the country remains deficient in oil, natural gas, iron ore, and nonferrous metal ores.

The coordination of national economic plans with the U.S.S.R. and other CMEA[2] countries, and long-term agreements, assure the greater part of the country's raw material and energy needs.

In the present 5-year plan (1976-80), the Soviet Union is to supply Czechoslovakia with about 36 million tons of iron ore (metal content), 5 million tons of pig iron, manganese ore, and ferroalloys, more than 200,000 tons of nonferrous metals,[3] and 88.1 million tons of crude oil.[4] Development of Czechoslovakia's economy continued in 1978 and 1979. In 1978 the national income increased 4% over that of 1977 and reached approximately 430 billion korunas (Kcs).[5] In 1979 the national income was 2.6% to 2.8% greater than in 1978. The total industrial output was Kcs583.0 billion in 1978,[6] about Kcs27 billion more than in 1977, 85% of the increase reportedly was achieved through higher productivity. In 1979 industrial production increased 3.7% over that of 1978; however, the growth of industrial production was lower than planned.

More than 20% of the country's industrial enterprises failed to fulfill the plan. Insufficient improvement of efficiency was a basic weakness of the country's development in 1979.[7] The enterprise production plans in nonferrous industry were generally fulfilled.[8]

In 1978 mining and quarrying contributed 4.5% to the total industrial production, of which the share of coal was 3.4%, crude oil 0.1%, metallic ore 0.5%, and other mining 0.5%.[9]

Production of the mineral processing industry contributed 4% to the total industrial production in 1978; production of the iron and steel industry, 9.6%; production of the nonferrous industry, 2.6%; and other nonmetallic mineral products, 2.8%. Contributions of mining and quarrying to the total industrial production in 1979 were estimated as approximately the same level as in 1978.

Investments into the national economy in 1978 totaled Kcs135 billion, of which about Kcs60 billion went into new machines and equipment. The share of machines and equipment continued to increase in capital construction, which was directed to fuel and energy projects and to the development of production lines and specially to those using domestic raw materials.[10] In comparison with 1978, 1.6% more funds were invested in the national economy.[11]

Capital construction in 1979 was directed to the development of the fuel-power base, with emphasis on the role of engineering, the chemical industry, and production based on domestic raw materials. In 1979, the following facilities among others were put into operation: the Jiri II coal mine (first stage); the first 440 megawatts block of nuclear powerplant V-I at Jaslovske Bohunice; two aggregates (30 megawatts each) in the Detmorovice thermal powerplant; and the central oxygen plant at Klement Gottwald New Metallurgical Plant in Kunice.

The number of industrial workers employed in state enterprises in Czechoslovakia totaled 2,874,000 in 1978, and the number of employees totaled 1,998,000. The number of workers and employees in state mineral and enery enterprises by branch (in thousands) follows:

Branch	Workers	Employees	Number of enterprises
Fuel extraction and processing industry	172	134	59
Power and heat generation	54	36	27
Ferrous metallurgy (including ore mining)	167	123	14
Nonferrous metallurgy (including ore mining)	42	30	20

In 1978-79, Czechoslovakia continued to participate in multilateral projects of the CMEA countries including construction of the Soyuz long-distance pipeline, construction of facilities for production of iron ore and production of ferroalloys on the territory of the Soviet Union, construction of an oil pipeline from an Adriatic seaport in Yugoslavia to Czechoslovakia, and many others.

The Soyuz gas pipeline was placed in service in January 1979, and Czechoslovakia is to receive an additional 2.8 billion cubic meters of gas annually beginning in 1980.[12]

The Soviet Union received almost all Czechoslovak equipment for the building of Soviet plants to produce ferroalloys in 1978, and deliveries of Czechoslovak equipment for the construction of iron ore dressing plants were also nearing completion in the year.[13]

In return Czechoslovakia is to receive iron ore and concentrates and other raw materials from the U.S.S.R. Czechoslovakia joined other countries in construction of facilities for the production of nickel in Cuba.

Exploration for raw materials in Czechoslovakia showed that Slovakia can contribute to the country's self-sufficiency in antimony and mercury; reportedly, copper production can be increased fivefold and lead and zinc production doubled. It is believed that Slovakia will be able to provide 5% of the country's needs of iron, 16% of copper, 11% of lead, 25% of zinc, and 20% of tungsten in the future. The further prospecting for lead, zinc, and copper is to be concentrated at the Banska Stiavnica deposits in the vicinity of the old mines and in the Slanske Hills near Zlata Bana. The results of geological prospecting have ensured a further expansion of output of ceramic raw materials, especially kaolin. In 1978, priority was assigned fo the development of tin ore mining and construction of new plants for processing the tin ore.[14]

Government Policies and Programs.—The 1980 plan for the development of the national economy is based on the policy set by the 15th Congress of the Communist party of Czechoslovakia. According to the plan, national income in 1980 is to increase 3.7%. Industrial production is to increase 4%. About 91% to 92% of the growth in national income is to be achieved by increased labor productivity. The 1980 plan calls for a 6.7% increase in pig iron production, and in increases of 5.5% in steel, 5.3% in rolled steel, and about 1.2% in coal and lignite production. In 1980, 1,272 megawatts of new power generating capacity are expected to come onstream. Special attention is to be paid to ensuring the development of the country's fuel and energy base, with particular emphasis on the production and deliveries of machinery for strip and deep mining and of equipment for the nuclear power engineering sector.[15]

PRODUCTION

In comparison with 1978 year, production output in 1979 went up slightly in all industries except steel and heat and power generation. Steel production was lower than in 1978. Electric energy production in 1979 was 1.5% less than in 1978. The nuclear plant V-1 Jaslovice Bohunice produced about 1.5 billion kilowatt-hours of electric energy.[16] The state plan for total coal and lignite production was fulfilled 99.7% in 1978 and 100% in 1979. The Ostrava-Karvina coal basin supplied more than 85% of all bituminous coal mined. Production of bituminous coal was under increasingly greater depth and under more difficult geological and mining conditions. The North Bohemian basin supplied about 73% of the brown coal output. This field experienced considerable difficulty in meeting the planned output for 1978 and 1979 because of severe winter conditions and delays in deliveries of coal mining machinery. Reportedly in 1979 the production of equipment for nuclear powerplants increased 95.9% over that of 1978, and production of machinery for surface mining of brown coal increased

47.8%.

The total output of ore in 1979 increased 2% over that of 1978; production of the nonferrous metals industry increased 2.8% and ferrous industry 1.9%.

In 1977, the Czechoslovakian Government reported that metallic ore reserves in the country are much larger than had been estimated. Output of nonferrous metals is expected to be increased after 1985.

Domestic uranium ore deposits were mined under U.S.S.R. control. All production was exported to the U.S.S.R. Considerable increase in uranium production is planned at Pribram and in North Bohemian regions in the near future.

The nonmetallic minerals industry in Czechoslovakia was producing magnesite from the Slovak deposits and kaolin and refractory clays from newly developed deposits. Development of the 150 million tons of feldspar reserves in the Jindrichuv area was expected to make Czechoslovakia self-sufficient in the near future.

In 1978-79 output of natural gas was insignificant; however, there is a possibility of some production increases in the future. About 18.4 million tons of petroleum were processed in both 1978 and 1979. Some 94% of Czechoslovakia's supplies of crude oil came from the U.S.S.R. The Druzba pipeline constituted the main source of crude oil. Domestic crude oil production continued to be insignificant.

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, arsenic, gold, uranium, feldspar, graphite, and a variety of other petroleum products are produced, but information is inadequate to make reliable estimates of output levels.

[2]Reported figure.

[3]This material, although reported as manganese ore, is believed to be manganiferous iron ore with an Mn content of about 17% and as such is not equivalent to material ordinarily reported as manganese ore, which generally contains 25% or more Mn.

[4]Includes gas produced from coal mines. Gross output of natural gas is not reported, but it is believed to exceed reported marketed output by a relatively inconsequential amount.

[5]Data presented are for those products reported in official Czechoslovak sources and in United Nations publications; no estimates have been included for other products or for refinery fuel and losses.

TRADE

In 1978-79, about two-thirds of Czechoslovakia's total foreign trade was with centrally planned economy countries. Half of this was with the Soviet Union, which supplied the main part of all Czechoslovakia's raw materials, including almost all of is oil, gas, and iron ore. In return Czechoslovakia supplied machines and other industrial products to the U.S.S.R.[17]

In 1978, exports of machinery and equipment contributed 53% of the total export value; fuels, mineral raw materials, and metals 15%. The value of machinery and equipment amounted to 40% of the total import; fuel, mineral raw materials, and metals 30%.[18] Czechoslovak imports of selected commodities in 1978 follows:[19]

Commodities	Total value (million korunas)	Centrally planned economy countries (million korunas)	Percent	Market economy countries (million korunas)	Percent
Ferrous ores	1,818	1,522	84	296	16
Ferrous metals	1,671	1,851	70	820	30
Nonferrous metals	2,482	2,052	83	429	17

Czechoslovakia's total trade turnover with various country groups for 1978 is shown in the following tabulation:

	Trade turnover (million korunas)	Percent-age share
CMEA and other centrally planned economy countries	95,852	72.7
Developed market economy countries	27,283	20.7
Developing countries	8,651	6.6
Total	131,786	100.0

The trade balance showed that the total deficit in 1978 was Kcs4.4 billion. Czechoslovakia's trade balance for 1978 was as follows:[20]

	Million korunas
CMEA countries	-2,423
Other centrally planned economy countries	377
Western developed countries	-4,351
Developing countries	2,035
Total balance	-4,362

In 1979 total turnover had been 14% greater than in 1978: 12.4% greater in trade with centrally planned economy countries and 16.8% greater in the trade with market economy countries; exports increased 16% and imports 12.1%. Trade with the developing countries also increased considerably.

A trade protocol for 1980 between the U.S.S.R and Czechoslovakia was signed on December 14, 1979. According to the protocol, trade turnover between the two countries will reach some 7.0 billion rubles, an increase of about 6% over that of 1979. As before, machinery and equipment will account for the largest share in Czechoslovak exports to the U.S.S.R. Primary products and raw materials including crude oil, gas, bituminous coal, iron ore, metals, and electric power will remain the leading commodity group in Czechoslovak imports. They will amount to almost two-thirds[21] of the total imports from the U.S.S.R. A trade and payment agreement for 1980 between Albania and Czechoslovakia was signed on October 22, 1979. Czechoslovakia will export machinery and equipment and import iron-nickel ore, chromium ore, and asphalt.

A protocol on commodity exchanges and payments for 1980 between Vietnam and Czechoslovakia was signed on October 24, 1979. Czechoslovakia will supply mainly rolled stock and machinery and import zinc, lead, tin, anthracite, and other commodities from Vietnam. A protocol on the exchange of goods between Czechoslovakia and Hungary for 1980 is to be worth 1,420 million rubles. It was signed on December 6, 1979. Hungary will export to Czechoslovakia bauxite, aluminum products, and other goods and will import from Czechoslovakia coke, rolled stock, and other commodities.

The signing of a contract for over Kcs200 million, between STROJEXPORT Foreign Trade Corporation on the one hand and the Weserhutte consortium from the Federal Republic of Germany and Precismeca from France on the other, completed the fourth stage of supplies for a long-distance belt-conveyer system for Czechoslovakia. The equipment, earmarked for the Maxim Gorki Mine in the North Bohemian coal district, will be put into service in the first half of 1981.[22]

In October 1979, Czechoslovakia and Yugoslavia signed a protocol on the Exchanges of Goods and Services for 1980. The turnover of the mutual exchange of goods and services will amount to about $1.2 billion, 15% over that of 1979. Imports from Yugoslavia will include nonferrous metals and bauxite.[23] Reportedly, an agreement is to be signed shortly providing for a Czechoslovakia credit of 115 million dinars for the Yugoslavia aluminum industry; 32,000 tons of aluminum products is to be exported to Czechoslovakia in return.

Czechoslovakia is Mongolia's second largest partner, after the Soviet Union. Exports and imports are balanced. In 1979, the mutual turnover of goods amounted to more than R20 million. Raw materials and livestock products accounted for more than

60% of Mongolia's exports.[24]

Under agreements on nuclear power industry development signed with the U.S.S.R., Czechoslovakia is to make by 1985 (for its own needs and for export) 23 sets of equipment for 440 megawatt units, and expects to start making equipment for 1,000 megawatt units after 1985.

Table 2.—Czechoslovakia: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite	--	215	All to Austria.

COMMODITY REVIEW

METALS

Aluminum.—The lack of aluminum raw material reserves in Czechoslovakia created a dependence on imports of bauxite and alumina.

Czechoslovakia's aluminum reduction plant, with an estimated capacity of 60,000 tons, is located at Ziar nad Hronom in Central Slovakia. Ziar operates on imported bauxite from Hungary. In 1978-79 the plant produced alumina, aluminum, and some aluminum products. Production was below the estimated capacity of the plant. Aluminum and special alloys from scrap were also produced at plants in North Moravia and Central Bohemia. Capacity of the Kovohute Bridlica manufacturing plant is estimated at 10,000 tons of foil and 26,000 tons of strip.

Antimony.—In 1978-79 antimony ores were mined in the Low Tatras in Slovakia and near Bratislava at Pezinok. Plans through 1990 emphasize the need to modernize and increase existing mining and ore processing facilities. Czechoslovakia expects to export antimony by 1990. Resources of antimony ore are mostly limited to the deposits situated in Slovakia, where extraction is also to be concentrated in the future. Czech production, especially in Krasna Hora where drilling was done in 1978 around Sedlcany and Pricov, could cover some part of antimony consumption. The known antimony deposits in th Czech Massiv are of a vein type with great uncertainty of mineralization.[25]

Copper.—Production of copper in 1979 was approximately the same as in 1978 and in 1977. Imports of copper metal from the U.S.S.R. and Poland supplied the main requirements of Czechoslovak industry consumption. Present Czechoslovak copper consumption is approximately 85,000 tons per year.

Under a long-term agreement, Czechoslovakia participated in the development of copper production at Lubin mines in Poland. In 1978-79 copper ores were mined in conjunction with iron ores at Rudnany (Slovakia) and near Roznava (Slovakia), copper-lead-zinc ores in Banska Stiavnica (Slovakia), and copper ores in the Zlate Hory (Moravia). Copper mining is to be expanded. Slovakia appears to have good prospects regarding copper mining.

The new copper-lead-zinc deposits were found in Zlata Bana, Roznava, Novoveska Huta, Slovinky, and Gelnica in 1978.[26] It is believed that Slovakia will be able to provide 16% of the country's needs of copper in the future.

Gold.—A new study of gold deposits was made by the Geoindustria enterprise of Prague. It is expected that new technologies will make it possible to process very lean ores, so that they meet much of the long-term home demand. It was found that what used to be regarded as copper, lead, and zinc deposits in the Jeseniky Mountains are in fact the country's biggest gold deposits as the value of gold far exceeds that of the other metals. Estimated metal content is 3 grams per ton of gold-bearing ore.[27]

Iron and Steel.—Iron ore deposits in Czechoslovakia occur in different areas, however, only deposits in Central Czechoslovakia and in the Slovak Ore Mountains are economically important. In 1978-79 iron ore was mainly extracted from the Rudnany mines, located in Slovakia. Domestic production supplied only a small part of the country's requirement of iron ore, and the main part of the ore was imported from U.S.S.R. The rest of the ore was imported from Brazil, Sweden, India, and Algeria. Czech participation in the construction of the Soviet Union's ore projects in the Ukraine and Kursk Magnetit Anomaly is planned to cover rising domestic requirements.

It is estimated that total reserves of iron ore in Czechoslovakia approximate 500 million tons with average metal content of about 30%. Steel scrap is the most important domestic raw material for steel production of which nearly 8 million tons were available in 1978.[28] Steel scrap accounted for more than 50% of steel production. About 40% of the processed steel scrap comes from the Prumysl Kovoveho Odpadru (Industry of Metal Scrap) enterprise and its Kovosrot subdivision. Investments in the iron and steel industry during 1978 totaled about Kcs5.7 billion.

The production of pig iron and steel in 1979 was below the 1978 level. It is anticipated that output of pig iron will reach 10.5 million tons in 1980 and 12.8 million tons in 1990. Crude steel production is planned to reach 16.3 million tons in 1980 and 20.4 million tons in 1990.

Czechoslovakia's plans for the steel industry are to reduce the open hearths production and to increase the oxygen converter output as shown, in percentage, in the following tabulation:

	1978	1980	1985
Open hearth	62	32	15
Electric	12	14	15
Oxygen	26	54	70
	100	100	100

The main aim of capital investment in the Czechoslovakian iron and steel industry in the 1976-80 period is to promote a more substantial change in the structure of production and range of products. Faster growth is planned for pipes, rolled products, alloyed and stainless steels, and specifically for a wider assortment of pipes.

The pipe program provides for a major increase in production of precision steel cold-formed pipes and oil pipes under a protocol on cooperation between the Governments of Czechoslovakia and the Soviet Union and involves the corporations Poldi Kladno, (SONR), Chomutov (VTZ), Ostrava-Kunice (NHKG), Podbrezova (SZ), and a few others.[29]

One of the largest capital investment projects in the Czechoslovak ferrous industry, the new pipe plant with a cost of more than Kcs1,800 million, was put into operation in 1979. It is a part of the Svermovy Zelezarny complex at Podbrezova (Slovakia).[30]

A new continuous casting machine with a capacity of 0.2 million tons per year was put into operation at the United Steel Works at Kladno in 1978. The construction of billet and blooming mills at Kladno continued in 1978 and 1979 and is expected to be the major project for 1980. When the whole project at Kladno is completed, the complex is reportedly to be capable of producing 1.2 million tons of steel per year.[31]

Expansion of manufacturing facilities at the Chomutov pipe plant was underway in 1978 and 1979, but progress of construction was hampered by delay in deliveries of imported technological equipment.[32]

Renovation and expansion of the new Klement Gottwald steel plant continued in 1979. The new capacity of the enterprise is expected to be 4.2 million tons of steel per year.

At the East Slovak Iron and Steel Complex at Kosice, the No. 2 blast furnace was put into operation in November 1979. A reduction is expected in coke consumption of 45 kilograms per ton of pig iron production. The complex accounts for one-third of the country's production of pig iron. Construction of the new No. 5, 25-ton electric furnace started in the metallurgical section of the Skoda enterprise in 1979, and replacement of an old open-hearth furnace by a new one is planned for 1980.

Lead and Zinc.—In 1978-79 lead-zinc ore continued to be mined at Pribram and Kutna Hora (Central Bohemia), Horni Beneso (Moravia), and Banska Stiavnica (Central Slovakia). About 70% of the total lead-zinc ore came from Czech deposits and some 30% from Slovakia deposits.

Production of lead and zinc is far below demand, and they continued to be imported mainly from Yugoslavia and the U.S.S.R. A substantial increase in lead-zinc production is expected after 1985. New investments are planned for Zlate Hory to develop deeper levels of the copper-lead-zinc ore and at the Horni Benesov deposits.[33]

Mercury.—Mercury was extracted from deposits at Rudnany (Slovakia). Over the 10 years of its existence, the mercury plant at Zeleznorudnedoly Rudnany produced 1.86 million kilograms of technically pure mercury. Czechoslovakia began to process the concentrate in 1969, and the country's economy became independent of mercury imports.[34]

Silver.—The rich deposits of silver have been largely depleted. The remaining deposits of Jihlava, Kutna Hora, Stribro, and Jachymov in Bohemia, and of Kremnica and Banska Stiavnica in Slovakia, are of little economic significance. The largest share of Czechoslovakia's total silver production is recovered as a byproduct from processing of polymetallic ores.

In 1978-79, domestic mines contributed a small percent of the silver used in the country. The further development of silver production in Czechoslovakia is to be concentrated on polymetallic ores and on the metallic Jochimov formations containing proustite (Ag_3AsS_3—silver arsenic sulfide).

Production of bismuth, cobalt, and nickel from Jochimov polymetallic ores could make production of silver mining economical.

The Svornost and Kovnost mines (Jochimov area) are the main potential producers of silver for the future. Silver minerals are known also in some polymetallic veins in the Pribram area (Vzancice, Radetice, and nearby), but their importance is small and the economy of production is highly problematical.[35]

Tin.—Tin ores were mined at Cinovec (North Bohemian region) and at the Horni Slovak (West Bohemian region). A new deposit of tin dioxide (SnO_2) has been discovered in significant quantity in Slovakia near Medvedi Brook, in the vicinity of the Hnilec village. The resources are estimated at 2 million tons of tin ore. According to Czechoslovak sources, there are more promising deposits of tin ores in the area of the Hnilec River.[36]

Uranium.—Czechoslovakia's proved reserves and production of uranium ore are substantial. Most of the uranium oxide production is exported to the U.S.S.R. The Soviet Union has total control of the exploration and production of uranium in Czechoslovakia. Data on uranium ore production are practically nonexistent, because such information is classified. Uranium production is centrally controlled and is headed by the Czechoslovak Uranium Industry (CSUP).

In 1978-79, the main mining areas included Hamar-na Jezere, Dolni Rozinka, Slovakov, Trutnov, Zodni Chador, Spisska Nova Ves, and Pribram. Major investment was underway in Pribram and North Bohemia. Ore concentration plants were located in Dolni Rozinka and Mudlovary. A new uranium ore dressing plant was put into operation in Straz pod Ralskem in the Ciska Lipa district in 1978. It will be one of the main dressing plants in the Czechoslovak uranium industry and will process uranium ore from North Bohemia. In 1978, shaft No. 19 of the Pribram uranium mine was being sunk. In 1979, the Pribram mine was extracting uranium ore from a depth of 1,480 meters.[37]

NONMETALS

Cement.—Czechoslovakia is an importer of cement. In 1978-79 cement was imported mostly from the U.S.S.R., Romania, and the German Democratic Republic.

The construction of the new cement plant at Prachovice with a capacity of 1.2 million tons of cement per year was in progress in 1978, and the trial operation started on April 1, 1979. Construction of this cement plant started in 1974, and cost was estimated at Kcs2.0 billion.[38] Cement plants at Turna, Cizkovice, and Rohoznik were also under construction in 1978-79. There are plans for construction of the Kraluv Dvur cement plant with a total capacity of 6,000 tons per day.

Fertilizers.—In 1978, official consumption of fertilizer per hectare of agricultural land was over 240 kilograms in nutrient content. Czechoslovakia is to use 268 kilograms per hectare by 1980 and about 320 kilograms by 1985. Production of nitrogen and phosphate fertilizers provides approximately 65% of the country's consumption.

While some urea was exported, Czechoslovakia imported significant amounts of fertilizer raw materials and maufactured fertilizers in 1978-79.

The production of manufactured fertilizers was planned to be developed further under the sixth 5-year plan (1976-80); however, the construction of new facilities is not anticipated. In 1978-79, emphasis was placed on better utilization of the existing facilities, intensification of production processes, and an increase of average nutrient content.

In 1978 and 1979, Czechoslovakia continued to make an urea-ammonium nitrate solution, DAM-390, at the pilot plant at Dusla Natinal Enterprise in Sala at the rate of more than 20,000 tons per year.[39]

The output of liquid fertilizer is to be expanded further under the next 5-year plan (1981-85). The output is to reach about 150,000 tons in 1981 and 600,000 tons in 1987.

Renovation of some of the plants for complex fertilizers is also expected under the new 5-year plan (1981-85). The situation is especially complicated regarding phosphate fertilizers because Czechoslovakia relies entirely on imports of material and cannot expect increased Soviet deliveries in the future. A new trend agreement between Jordan and Czechoslovakia was signed on May 27, 1979. The Czech will buy phosphate fertilizers from Jordan Fertilizer Industry Co., which is due to start production at Aqaba in 1981. In 1978 negotiations were held in Vietnam on the feasibility of mining local phosphate deposits, building phosphorus plants, and importing phosphate fertilizers from Vietnam in the future. Negotiations were also underway with Mongolia for joint utilization of recently discovered phosphate deposits.[40]

Fluorspar.—Domestic fluorite output remained inadequate to meet the demand, and about three-fourths of the consumption was met by imports in 1978 and 1979. The main center for fluorite production continued to be Sobedruby, located in the Ore Mountains in North Bohemia, which produces fluorite in the form of concentrates.

Since 1975, the mine and processing plant have been renovated and enlarged. Reportedly, recently discovered fluorspar deposits in the Ore Mountains will help to make Czechoslovakia self-sufficient in fluorite after 1985.

Kaolin.—There are large deposits of high-quality kaolin in Czechoslovakia. The deposits of kaolin near Karlovy Vary are reported to be sufficient to last until 1995, the Pizensky deposits, until 2020, and the Podbarany kaolins, until 2100.

The deposits near Karlovy Vary contain 25% to 35% of pure kaolin, and the Pizensky deposits about 13% to 14%. Mining at the Karlovy Vary areas is planned to go much deeper after 1980. In 1979, Czechoslovakia exported China clay to many countries including the Federal Republic of Germany, Poland, Austria, Yugoslavia, Hungary, the Netherlands, the German Democratic Republic, Sweden, and others.

New washing facilities for paper and ceramic kaolins have been built recently at the Kaznejov and Bozicany plants. The plant at Velke Opatovice has expanded its manufacturing capacity by the construction of new facilities for dressing and storing clays at its branch in Brnik.

The plant at Sadov was also renovated, the output of paper kaolin was expanded, and it is planned to enlarge the washing facilities. Renovation of the Hlubany plant was underway in 1978.[41]

Magnesite.—In 1978-79 production of magnesite fully covered the consumption of the country, and magnesite was exported mainly to Hungary, Poland, the German Democratic Republic, Romania, and the Federal Republic of Germany.

Lavinobana and other places in Central and Eastern Slovakia are important magnesite mining and processing centers. Along with the growth of the output of Slovenske Magnezitive Zavody at Kosice (Eastern Slovakia), the exports through Kerametal Bratislava were also increasing. Slovenske Magnizitove Zavody exported about one-half of its output. Czechoslovakia has been developing and renovating magnesite mines. It is planned to increase the capacities of the mines approximately to 0.1 to 0.5 million tons per year and to decrease the number of small mines in the near future. The plans also call for the rapid completion of facilities for manufacturing refractory products.[42]

Sulfur.—In 1978 a sulfuric acid plant at Prerov and a 40,000-ton-per-year phosphoric acid plant at Postorna were brought onstream. The capacity of the Prerov sulfuric acid plant is 600 tons per day.

MINERAL FUELS

Total energy production derived from fossils and from hydroelectric and nuclear electric power generation was 88.4 million tons standard coal equivalent (SCE) in 1979, with coal, including lignite, supplying 98%. Total consumption of primary energy was over 127 million tons SCE with coal providing about 67%, oil 23%, natural gas 9%, and hydroelectric power, nuclear power, and imported electric power less than 1% each. The primary energy balance of Czechoslovakia for 1978 and 1979 is shown in the table.

Table 4.—Czechoslovakia: Total primary energy balance for 1978 and 1979

(Million tons of standard coal equivalent)[1]

	Total primary energy	Coal (bituminous, brown, and lignite) and coke	Crude oil and petroleum products	Natural gas	Hydro-electric power	Nuclear power	Turnover of electrical energy
1979:							
Production	88.4	86.3	0.2	1.1	0.5	0.3	--
Imports	46.2	5.9	30.0	9.8	--	--	0.5
Exports	77.3	6.4	.8	--	--	--	.1
Apparent consumption	127.3	85.5	29.4	10.9	.5	.3	.4
1978:							
Production	87.0	85.2	.2	1.0	.5	.1	--
Imports	44.7	5.8	28.8	9.7	--	--	.4
Exports	7.1	6.1	.8	--	--	--	.1
Apparent consumption	124.6	84.8	28.2	10.7	.5	.1	.3

[1]1 ton of standard coal equivalent (SCE)=7 million kilocalories. Conversion factors used are as follows: Hard coal, 1.0; brown coal and lignite, 0.6; crude oil, 1.47; natural gas (1,000 cubic meters), 1.33; hydroelectric and nuclear power (1,000 kilowatt-hours), 0.125.

Sources: Statistical Yearbook of Czechoslovakia, Prague, 1979; Statisticke Prehledy (Statistic Summary), Prague, No. 2, 1980, p. 42.

Coal.—Output of bituminous coal in 1980 and in the long run is expected to remain at approximately the same level as in 1978 and 1979. The Ostrava-Karvina coal basin supplied more than 85% of Czechoslovakia bituminous coal mined in 1978 and 1979; Kladno basin supplied about 8%, and the Plzen, Trutnow and Rosice basins about 7%. More than 65% of bituminous coal produced was of metallurgical quality. Deep coal mining of bituminous coal in Czechoslovakia meets demand for coking coal for the domestic industry as well as for export.

There were some 16 mines in the Ostrava-Karvina bituminous coal basin, and 2 mines were under development in 1978 and 1979. The average depth of mining was about 600 meters; worked seam thickness ranged from 0.5 to 3-4 meters; however, a considerable part of the reserves at the Ostrava-Karvina coalfield is formed by seams from 0.5 meter to 0.7 meter. Coal was mined under increasingly more difficult conditions in 1978 and 1979; therefore, scientific and technological research was directed towards working of thin seams and towards difficult mining conditions at depths of about 1,000 meters.[43]

The Darkov mine with a projected annual capacity of 5 million tons was the largest capital investment in the Ostrava-Karvina coal basin in 1978 and in 1979.[44] There is a total of 1.7 billion tons of hard coal, wich can be extracted from the Ostrava-Karvina coalfield and other areas, but geological surveys of other deposits have not yet been completed. The reserves should last 50 to 60 years at the present rate of production.

During the seventh 5-year plan (1981-85) in the Kladno Mining Concern development is to begin on the Slany and Chotikov mines and continue on the Frenstat and Pribor mines of the Podbesky region and on the Darkov mine. In 1979, a contract was signed between the Czechoslovak foreign trade company Metalimex and the U.S.S.R. for the supply of 3.2 million tons of hard coal to Czechoslovakia in 1980.

Brown coal and lignite output is planned to reach 98.5 million tons in 1980 and 106 million tons in 1985. The North Bohemian basin is to supply the largest part (68.2 million tons) of the brown coal production in 1980. In 1978, about 73% of brown coal came from the North Bohemian basin, about 23% from the Sokolow basin, and the remainder from the Kandlova and Mody Kamen basins.

The North Bohemian coal district is the only so-called developing district in Czechoslovakia. It is to meet 44% of all energy needs of the country in 1980 and about 37% in 1990. However, the North Bohemian brown coal basin did not fulfill 1978 and 1979 plan targets. This underfulfillment of year plans in production of brown coal was concentrated primarily at the Maxim Gorky and Czechoslovak Army large open pit mines. The unreliable operation of technological units was the chief reason for this situation. The plan of the overburden removal was fulfilled 92.4% in 1979. The prospects for increasing the brown coal output in the future were therefore not particularly good.

In 1978 and 1979 development was continued on the large, 6-million-ton-annual-capacity Vrsany surface mine near Most. The Vrsany mine was scheduled to come into operation in 1982 and is to supply coal to the Pocerdany electric powerplant. Development of a new brown coal mine with projected capacity of 15 million tons per year at Miculcice, near Hodonin, started in 1979, and production is scheduled to begin in 1982. This project is estimated at Kcs894 million.[45] The development of the new brown coal strip mine, Erika, with annual capacity of 1 million tons of brown coal was completed in the Socolov brown coal basin in 1978.

During the seventh 5-year plan (1981-85) renovation of the Czechoslovak Army, Sverma, Mercur Bruzno, and other mines is planned, but the most important development is planned for the Maxim Gorky open pit mine. Resources of brown coal and lignite are sufficient for another 40 to 50 years, if annual production is maintained at about 100 million tons. Reserves in the North Bohemian field are estimated at 5.9 billion tons. Present technology permits the extraction of less than 40% of the reserves, but this is to be raised to more than 60%. There is also 640 million tons of brown coal in the Sokolov field in Northern Bohemia and 275 million in Slovakia.

Natural Gas.—The extraction of natural gas in Czechoslovakia is insignificant. Most gasfields discovered during the 1970's have been very small. The U.S.S.R. supplied all of Czechoslovakia's gas imports in 1978 and 1979.

The two transit pipelines (each of 1,120 kilometers), carrying 26,000 million cubic meters of Soviet natural gas per year through Czechoslovakia, were in operation in 1978 and 1979. In July 1978, work started on the construction of the third transit pipeline. This line, with an annual capacity of 16 billion cubic meters, will convey natural gas from the Soviet Union to Central and Western Europe; 3.6 billion cubic meters will be shipped to Czechoslovakia. On completion of this gas pipeline (the Consorcium), the transit system will have an approximate total length of 3,150 kilometers. By 1984, it is to transport 53 billion cubic meters of gas annually, under a trade agreement with the U.S.S.R., Czechoslovakia is scheduled to acquire more than 8 billion cubic meters of their gas.[46]

Construction of the Soyuz gas pipeline, which runs from Orenburg in the southern Urals to the western borders of the U.S.S.R., was completed in 1979, and 2.8 billion cubic meters of gas is to be delivered to Czechoslovakia through this line in 1980.

Petroleum.—Production of crude oil in Czechoslovakia is insignificant and is concentrated in South Moravia and Slovakia. The U.S.S.R. provided about 94% of Czechoslovakia oil imports in 1979. Under a contract signed in Prague on January 25, 1980, 19.2 million tons of crude oil and petroleum products are to be imported from the U.S.S.R. in 1980. The total value of the contract is R1,125 million. The Adriatic line is expected to be operational in 1980,[47] when Czechoslovakia is to receive some 5 million tons of crude oil per year from Africa and the Middle East. The 735-kilometer Adriatic Pipeline will run from the Yugoslavian port of Omisalj on the island of Krk through Yugoslavia and Hungary to Czechoslovakia. Czechoslovakia contributed to the construction of the Adriatic pipeline with a credit of $25 million, in return for which the country is to be able to use the pipeline.[48]

Since the beginning of February 1962, when the Druzhba oil pipeline went into operation, until the end of 1978, this pipeline has carried more than 170 million tons of crude oil to Czechoslovakia. The Soviet crude oil is refined and processed at five refineries in Czechoslovakia into more than 260 refinery products and over 5,000 petrochemical items. Refining capacity on January 1, 1978, was estimated at approximately 20 million tons per year. The Slovnaft combine in Bratislava, the largest and most modern refinery and petrochemical complex in Czechoslovakia, is to process 9 million tons of crude oil in 1980, 85,000 tons more than in 1979.[49]

In the 1975-78 period, the Chemapol plant in Kralupy processed 9 million tons of Soviet crude oil. The plant, which is directly connected to the Druzhba oil pipeline, produces gasoline, diesel, heating oil, and other products.

A new refinery for the processing of Soviet crude went onstream at Vajany near Kosice in Slovakia in 1978. The planned production of this refinery for 1980 is 1.5 to 2 million tons.

The Czechoslovak refining industry is to be capable of processing 21 million tons of crude oil in 1980: 9 million tons in the Bratislava Slovnaft enterprise, approximately 6 million tons in Litvinov, 3 million tons at Kralupy, 1.5 million tons in Vojang, 1 million tons in Pardulice, 300,000 tons in Ostrava, and 200,000 tons in Kolin.

The Mineral Industry of Denmark and Greenland

By Joseph B. Huvos[1]

During 1978 and 1979, the economy of Denmark and Greenland was sluggish and was expected to remain so until the advent of a major international economic upturn. Balance of payments considerations resulted in a restrictive fiscal and monetary policy. Inflation was 11.4% and unemployment was 6.1%. The gross national product (GNP) of Denmark and Greenland, reported as a total, was about $54 billion.[2] [3] The Danish Kroner was devalued by 5% against the West German mark.

Denmark's small mineral resources, consisting of some North Sea oil, gas, diatomite, and Greenland's modest lead-zinc ore deposits, contributed little to the GNP.

Notable events included formation of a ferrous scrap company, Government approval of a $50 million loan to the sole Danish steel company, and formation of a Danish-West German joint oil enterprise. Greenland obtained through home-rule a veto power over mineral exploitation, and the island's offshore petroleum drilling ran at a reduced level.

DENMARK

PRODUCTION

Denmark's production of selected minerals and mineral products are shown for 1976, 1977, 1978, and 1979 in table 1.

Table 1.—Denmark: Production of mineral commodities

(Thousand metric tons unless otherwise specified)

Commodity	1976	1977	1978[p]	1979[e]
Cement, hydraulic[1]	2,355	2,309	2,627	2,700
Chalk[1] tons	89,719	124,133	110,939	NA

[6]Partial figures; exclude an unreported quantity of quartz and quartzite with a sales value of $377,833 in 1976; $356,143 in 1977; NA in 1978; and NA in 1979.

TRADE

In 1978 and 1979, there was no significant change in Denmark's foreign mineral trade. Total mineral trade in 1977 and 1978 is shown in tables 2 and 3.

Table 2.—Denmark: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite and concentrate	13,720	41,561	United Kingdom 17,662; West Germany 6,827; Republic of South Africa 5,760; Finland 2,153.
Oxide and hydroxide	248	109	India 30; United Kingdom 24; France 19.
Metal including alloys:			
Unwrought and scrap	13,562	17,207	West Germany 11,198; Belgium-Luxembourg 2,137; Sweden 1,988.
Semimanufactures	12,052	12,459	Sweden 5,566; West Germany 1,797; Norway 802; United Kingdom 776.
Antimony metal including alloys, all forms	22	23	Finland 20; Colombia 2.
Chromium: Chromite	--	12	Belgium-Luxembourg 10.
Cobalt metal including alloys, all forms kilograms	100	--	
Copper metal including alloys:			
Scrap	11,120	12,499	West Germany 11,723; Sweden 336; United Kingdom 158.
Unwrought	1,012	882	Sweden 564; West Germany 314.
Semimanufactures	5,757	9,246	United Kingdom 1,651; Sweden 1,494; France 933.
Iron and steel:			
Ore and concentrate	4,763	10,323	West Germany 6,596; Netherlands 1,800; United Kingdom 1,460.
Roasted pyrite	--	608	All to West Germany.
Metal:			
Scrap	57,006	81,430	West Germany 55,325; United Kingdom 7,131; Norway 6,992; German Democratic Republic 5,071.
Pig iron, including cast iron	411	100	Sweden 80; West Germany 14.
Sponge iron, powder, shot	--	118	West Germany 106; Sweden 4.

See footnotes at end of table.

Sand, including metal bearing	144,255	138,325	Sweden 101,455; Norway 14,923; West Germany 10,245.
Sulfuric acid	510	39,137	Netherlands 17,255; Portugal 11,872; Switzerland 3,965.
Talc, steatite, soapstone, pyrophyllite	44	72	Oman 20; Iceland 15; People's Democratic Republic of Yemen 10.
Other:			
Crude	1,032	1,125	West Germany 609; Switzerland 206; Finland 181.
Slag, dross, and similar waste, not metal bearing	15,293	10,947	West Germany 3,615; Norway 3,444; Sweden 693; Netherlands 688.
Oxides and hydroxides of magnesium, strontium, barium	73	([1])	NA.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	113	127	Portugal 20; Sweden 36; Yugoslavia 20; Finland 18.
Carbon black and gas carbon	28	20	Sweden 10; Kuwait 1; Saudi Arabia 1.
Coal and coke, including briquets	58,904	66,236	Norway 28,115; Sweden 25,344; West Germany 7,786.
Gas, hydrocarbon, liquefied	21,173	21,649	United Kingdom 8,275; Sweden 7,914; West Germany 1,500.
Peat, including peat briquets and litter	1,831	2,518	Sweden 1,167; Netherlands 533; West Germany 406.

See footnotes at end of table.

Table 2.—Denmark: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
MINERAL FUELS AND RELATED MATERIALS — Continued			
Petroleum refinery products:			
Gasoline ______ thousand 42-gallon barrels	5,155	5,037	Sweden 4,432; Norway 131; West Germany 121.
Kerosine and white spirit ______ do	142	60	Sweden 33; Faroe Islands 17.
Distillate fuel oil ______ do	8,713	8,513	Sweden 4,699; United Kingdom 2,130; Faroe Islands 718.
Residual fuel oil ______ do	1,442	1,287	Sweden 748; Netherlands 297; Norway 131.
Lubricants ______ do	189	193	Norway 125; Sweden 17.
Mineral jelly and wax ______ do	5	5	Sweden 3.
Liquefied petroleum gas ______ do	246	251	United Kingdom 96; Sweden 92; West Germany 17.
Pitch ______ do	18	8	Sweden 6.
Bitumen and other residues ______ do	831	834	Sweden 480; Norway 190; Finland 149.
Other[3] ______ do	55	54	Norway 38; West Germany 11.
Total ______ do	16,796	16,242	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	--	7,667	Norway 5,398; West Germany 1,515.

NA Not available.
[1]Less than 1/2 unit.
[2]Includes products of magnesite, diatomite, and other refractory materials.
[3]Including bituminous mixtures, n.e.s., and mineral tars and products.

Table 3.—Denmark: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite and concentrate	4,543	10,134	All from Greece.
Oxide and hydroxide[1]	3,662	4,294	United Kingdom 2,366; Italy 986; West Germany 544; United States 271.
Metal including alloys:			
Scrap	2,776	1,637	Norway 749; West Germany 421; Sweden 273.
Unwrought	12,974	17,122	Norway 13,543; United Kingdom 1,858; Sweden 1,160.
Semimanufactures	53,955	51,151	West Germany 12,850; Norway 9,018; Sweden 8,715.
Antimony metal including alloys, all forms	20	8	Spain 5; Netherlands 2; China, mainland, 1.
Cadmium metal including alloys, all forms	8	8	All from Norway.
Chromium:			
Chromite	103	144	Finland 120; West Germany 24.
Oxide and hydroxide	510	147	West Germany 106; Italy 38.
Cobalt:			
Oxide and hydroxide	22	10	Belgium-Luxembourg 5; United Kingdom 3; Canada 2.
Metal including alloys, all forms	20	29	Belgium-Luxembourg 24; West Germany 3.
Copper metal including alloys:			
Scrap	795	1,460	France 735; West Germany 263; Finland 166; United Kingdom 132.
Unwrought	7,685	5,945	Belgium-Luxembourg 4,535; West Germany 618; Sweden 471.
Semimanufactures and master alloys	30,536	29,686	Sweden 8,901; Belgium-Luxembourg 7,697; West Germany 6,238.
Iron and steel:			
Ore and concentrate	512	2,715	All from Sweden.
Roasted pyrite	36,158	38,452	All from Norway.
Metal:			
Scrap	12,815	262,824	United Kingdom 159,749; West Germany 53,990; Sweden 27,431.
Pig iron, cast iron, other[2]	28,702	22,651	Norway 2,925; Sweden 2,664; German Democratic Republic 2,213; U.S.S.R. 1,889.
Ferroalloys	14,744	23,195	Norway 18,421; United Kingdom 2,348; Sweden 1,187; U.S.S.R. 883.
Steel, primary forms	73,031	36,201	Poland 15,125; Sweden 7,373; United Kingdom 4,490; West Germany 3,547.
Semimanufactures:			
Bars, rods, angles, shapes, sections[3]	367,628	377,764	West Germany 100,992; Sweden 63,589.

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	10,064	12,501	Iceland 6,483; Portugal 5,220; Netherlands 444.
Dust and powder of precious and semiprecious stones kilograms	17	19	Switzerland 12; Netherlands 4.
Grinding and polishing wheels and stones	1,151	1,222	West Germany 469; Austria 294; Sweden 192.
Asbestos	26,926	21,470	Canada 12,456; Cyprus 4,187; Republic of South Africa 2,405.
Barite and witherite	4,471	5,863	Ireland 3,924; United Kingdom 947; West Germany 587; Netherlands 389.
Boron materials:			
Crude natural borates	63,857	51,770	West Germany 35,064; German Democratic Republic 9,279; Sweden 2,882.
Oxide and acid	234	263	France 170; Italy 69; West Germany 9.
Cement	29,518	19,382	West Germany 15,803; Norway 1,621; Sweden 726; France 673.
Chalk	6,951	8,942	West Germany 4,170; Sweden 2,497; France 1,345; Switzerland 900.
Clays and clay products (including all refractory brick):			
Crude: Kaolin and other	39,641	42,382	United Kingdom 26,619; West Germany 8,315; Czechoslovakia 2,982; France 947.
Products:			
Refractory (including nonclay brick)	34,566	33,282	West Germany 18,264; Austria 5,854; Sweden 4,957.
Nonrefractory	86,541	87,909	West Germany 38,209; Italy 32,067; Sweden 4,517.
Cryolite and chiolite	54,600	53,300	All from Greenland.
Diamond:			
Gem, not set or strung carats	9,632	5,437	Belgium-Luxembourg 2,015; Israel 888; Switzerland 676; United Kingdom 629.
Industrial kilograms	2	14	Switzerland 5; Republic of South Africa 4; United States 2.
Diatomite and other infusorial earth	4,607	4,233	United States 1,684; Iceland 1,010; Spain 626; France 558.
Feldspar, leucite, nepheline syenite	9,884	8,902	Norway 8,052; Sweden 638; West Germany 157.
Fertilizer materials:			
Crude:			
Nitrogenous	10,835	--	
Phosphatic	261,825	281,525	Morocco 183,066; United States 98,200; Sweden 160.
Potassic	925	825	All from West Germany.
Manufactured:			
Nitrogenous	161,397	108,709	Norway 64,071; West Germany 16,358; Netherlands 12,242; Switzerland 3,148.
Phosphatic:			
Thomas (basic) slag	124	51	All from West Germany.
Other	21,562	5,712	Israel 3,650; West Germany 1,346; Netherlands 666.
Potassic	225,280	219,646	West Germany 75,913; Canada 75,346; East Germany 42,075.
Other, including mixed	429,918	539,128	Norway 398,695; West Germany 84,219; Belgium-Luxembourg 29,674.
Ammonia	252,728	277,657	West Germany 88,806; United Kingdom 83,345; Kuwait 18,563; Venezuela 16,506.
Fluorspar	2,179	4,462	France 2,269; United Kingdom 1,208; West Germany 934.
Graphite, natural	740	754	West Germany 660; United Kingdom 44; Norway 27.
Gypsum and plasters	369,984	298,036	Spain 208,845; France 48,158; U.S.S.R. 28,682; Poland 5,696.
Lime	3,028	3,438	West Germany 2,335; Poland 862; Sweden 100.
Magnesite	9,638	19,046	Austria 8,969; Czechoslovakia 4,652; Spain 2,750; China, mainland, 1,894.
Mica:			
Crude, including splittings and waste	226	255	United Kingdom 119; Norway 80; Canada 35.
Worked, including agglomerated splittings	43	50	France 26; West Germany 12; Belgium-Luxembourg 8.
Pigments, mineral:			
Natural, crude	423	--	
Iron oxides, processed	4,249	5,360	West Germany 4,430; Spain 545; Netherlands 155; United Kingdom 119.

NA Not available.
[1]Excludes an unknown quantity valued at $84,622.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—A new ferrous scrap company, Danscrap A/S, was formed by the country's leading scrap interests, H. I. Hansen A/S of Odense, Petersen & Albeck A/S, and Levin Jern & Metal, both of Copenhagen. It was announced that Danscrap A/S will act as the sole agent for Det Danske Staalvalsevaerk (DDS), Denmark's only steelmaker, and will also be the sole agent for participating scrap companies.

The Danish Government approved state aid totaling about $50 million to DDS. One-third of the grant is a repayable capital loan; the rest is in the form of loan guarantees. The company also planned to increase its existing $50 million capital by 50% through contributions from its shareholders.

The production capacity of DDS was about 1.5 million tons of crude steel per year. The company is to become a virtually all-electric steelmaker, using scrap as the only raw material at its Frederiksvaerk plant, located north of Copenhagen. This was expected to occur in 1980, when the company's four open hearth furnaces and blooming mill are to be phased out in favor of two electric arc furnaces and a new billet casting plant.

Nonmetals.—*Cement.*—As Aalborg Portland-Cement-Fabrikk, owned by F. L. Smidth & Co., remained the country's sole cement manufacturer, with three plants in North Jutland: Rördal, near Aalborg, operated seven wet-process kilns (2.2 million tons per year); Lindholm, near Nörresundby, operated two kilns (285,000 tons per year); and Danmark, also near Aalborg, operated one kiln (185,000 tons per year).

Limestone.—Filler-extender and chalk whiting production ceased at Aalborg Portland-Cement-Fabrikk's Dania plant in North Jutland. Future deliveries were expected to come from the F. L. Smidth group's other holding, A/S Faxe Kalkbrud. Faxe Kalk produces about 25,000 tons per year chalk whiting at Stevns, south of Copenhagen on Zealand Island, and up to 200,000 tons per year of pulverized limestone at Fakse Ladeplads, located further to the south.

Mineral Fuels.—In 1978, there was no change in Denmark's virtually complete dependence on imported fuels. There was only a nominal production of crude oil and insignificant production of hydroelectric power. Discussion continued on the possibility of introducing nuclear power and utilizing North Sea natural gas.

Table 5 shows supply and apparent consumption of fuel and power in 1977 and 1978.

Table 5.—Denmark and Greenland: Supply and apparent consumption of fuels and power for 1977 and 1978

(Million tons of standard coal equivalent[1])

	Total energy	Coal and coke	Petroleum and refinery products[2]	Hydroelectric power[3]
1977:				
Production[4]	0.8	--	0.8	--
Imports	35.1	5.7	29.1	0.3
Exports	3.4	--	3.2	.2
Apparent consumption	32.5	5.7	26.7	.1
1978:[p]				
Production[4]	.8	--	.8	--
Imports	33.7	6.3	26.9	.5
Exports	2.1	--	2.0	.1
Apparent consumption	32.4	6.3	25.7	.4

[p]Preliminary.
[1]1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories.
[2]Includes some liquid natural gas imports.
[3]Includes foreign trade of all electricity.
[4]Includes only primary energy.

Petroleum and Natural Gas.—The Danish Underground Consortium (DUC) and the Federal Republic of Germany's German Offshore Consortium, in a joint undertaking, were drilling the oil well Tove-1, some 25 kilometers south of the Dan Oilfield on the border between the Danish and West German North Sea sectors. DUC terminated its Per-1 well at 2,781 meters after insignificant oil shows and spudded Nils-1, which is about 11 kilometers southwest of the Dan Field.

Plans were readied for utilizing the recoverable natural gas reserves in the Danish sector of the North Sea, estimated at 110 to 120 billion cubic meters.[4] According to plans, the natural gas would be used in Denmark to supply about 15% to 20% of the country's consumption for 20 to 30 years. This plan would make necessary the construction of a distribution network of some 15,000 kilometers in length. Connections of this network to both West Germany and Sweden would enable Sweden to import an additional 1.2 billion cubic meters of natural gas annually from West Germany.

Production was virtually unchanged at Dan, Denmark's only operating oilfield, located about 200 kilometers west of Ejsberg in 41 meters of water. About 27 kilometers northwest of Dan, the Gorm Oilfield was under development. Recoverable reserves at Gorm were estimated at 15 to 22 million tons of crude oil.[5] Production was expected to start in 1981.

Denmark's oil refining capacity remained unchanged at about 11.75 million tons per year, divided mainly among Gulf Refining Co., Dansk Esso A/S, and A/S Dansk Shell, with refineries located respectively at Stignaes, Kalundborg (both on Zealand Island), and Fredericia (in Jutland).

GREENLAND

In January 1979, Greenland obtained home rule, which gave the local Government veto power over all mineral exploration, but Greenland remained heavily dependent on Danish financial aid. Greenland continued to be a producer of lead and zinc concentrates and talc, and shipped some crude cryolite from existing stocks.

Greenland's mineral production in 1976, 1977, 1978 and 1979 is shown in table 6. Greenland's total foreign trade for 1977 and 1978 is shown in tables 7 and 8.

Table 6.—Greenland: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
Lead, mine output, metal content	27,000	28,800	30,600	31,000
Silver, mine output, metal content (thousand troy ounces)	479	521	559	[2]617
Zinc, mine output, metal content	81,000	76,600	82,400	87,300

[e]Estimate. [p]Preliminary.
[1]In addition to the commodities listed, a variety of crude construction materials (common clays, sand and gravel, and stone) are undoubtedly produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.
[2]Reported figure.

[1]Value only reported at $125,433.

COMMODITY REVIEW

Petroleum.—Of 13 offshore concessions awarded in 1975, in an area about 250 miles west of Holsteinsborg, 10 were abandoned in 1977. Mobil Oil A/S and Chevron Oil A/S, together with the National Iranian Oil Co. as a partner, were still planning to drill. In the meantime, attention was turning to the east coast of Greenland, where the Danish Government was planning to spend $2 million on exploration.

Uranium.—Uranium reserves of about 27,000 tons were discovered at Kvanefjeld near Narassaq by the Danish State Atomic Research Institute. The ore assayed 340 grams of uranium per ton, and another 16,000 tons of uranium ore at the same location assayed 300 grams per ton of uranium.[6]

The Mineral Industry of Egypt

By Candice Stevens[1]

Increased petroleum production boosted Egypt's gross national product (GNP) to $13 billion[2] in 1978 and to an estimated $15 billion in 1979. The principal mineral industries outside the oil sector were iron and steel, aluminum, phosphate, and small nonmetallic mineral operations. Egypt's economy continued to suffer from a large balance-of-trade deficit, growing external debts, and high unemployment and inflation rates. A new economic program (1978-1982) was issued during 1978 which aimed to produce a growth rate of at least 8% per year, reduce inflation to less than 10% per year, and promote equilibrium in the balance-of-payments. The peace agreement concluded with Israel in 1979 provided for the return of portions of the Sinai Peninsula and its petroleum and mineral resources. In 1978, the International Monetary Fund agreed to lend Egypt $750 million over a 3-year period contingent on the enactment of certain economic reforms. The United States continued to be the largest single aid donor to Egypt with annual assistance of $1 billion since 1975.

Egypt hoped to increase its foreign exchange earnings through revenues from petroleum production, tourism, the Suez Canal, the Suez-Mediterranean pipeline (SUMED), and increased remittances from Egyptian workers abroad. Plans were being enacted to expand production in all major mineral industries and to increase surveying and exploration efforts. The Egyptian Geological Survey Organization was conducting a detailed mineral survey of the Eastern Desert, which focused on deposits of copper-nickel, copper-zinc, gold, and tantalum. A regional Geological Survey office was to be established at Al Arish in the Sinai Peninsula to investigate the development of Sinai mineral deposits including manganese, coal, kaolin, gypsum, and glass sands. In 1978, Continental Oil Company (Conoco) completed metalogenic maps of the Western Desert and began work in conjunction with the U.S. Geological Survey on a new geologic map of Egypt in 1979.

Further infrastructure development was also scheduled under Egypt's economic program. The first phase of the deepening and widening of the Suez Canal was to be completed by 1980. The expansion program was to enable ships up to 150,000 tons, laden, to transit the Canal; the second stage of construction work would enable passage of ships up to 260,000 tons, laden. In 1978 and 1979, the Suez Canal earned about $500 million annually in transit fees, which were expected to increase to $1 billion per year by 1985.

The construction of the Sidi Kreir nuclear power station west of Alexandria remained a subject of negotiation. This was one of two 600-megawatt nuclear reactors to be supplied by Westinghouse Electric Corporation (United States) under an agreement concluded in 1976. In 1979, the Egyptian Electricity Authority received a $102 million loan from the International Bank for Reconstruction and Development (IBRD) toward the financing of a 900-megawatt thermal power station at Shoubrah El Kheima north of Cairo. Technical studies on the construction of a 10,000-megawatt hydroelectric powerplant in the Qattara depression were completed in 1979. No decision was made on the $1 billion project by yearend. In 1978 and 1979, oil and natural gas accounted for about 70% of Egypt's energy requirements. Hydroelectric power based on the 2,100-megawatt Aswan Dam powerplant accounted for the remainder.

PRODUCTION AND TRADE

Production of most of Egypt's major mineral commodities increased in 1978 and 1979 as Egypt intensified its mineral development efforts. Petroleum production increased from 151 million barrels in 1977 to 176 million barrels in 1978 and to about 188 million barrels in 1979 as new oilfields were brought onstream. Ongoing exploration was expected to raise production to 1 million barrels per day of oil by 1982. Iron ore production has risen steadily owing to increased exploitation of the Bahariya Oasis deposits. Phosphate production increased to 639,000 tons in 1978 and was to more than double in the next 6 years with the development of new deposits. In line with the development of raw material supplies, steel, fertilizer, and cement facilities were undergoing expansions in capacities. Mineral production in Egypt is shown in table 1.

Egypt had a balance-of-trade deficit of $3.3 billion in 1978 and approximately $4.3 billion in 1979. Principal mineral exports were petroleum and petroleum products, phosphate rock, aluminum, iron and steel, and salt. Egypt had a $720 million surplus on its oil account in 1978 and an $850 million surplus in 1979. Petroleum was exported primarily to Italy (56%) and other Western European countries. However, increased crude oil exports were unable to offset needed imports of petroleum products, basic foodstuffs, and intermediate capital goods for industry. The United States was one of Egypt's largest trading partners and supplied $1.1 billion in exports to Egypt in 1978 and $1.5 billion in exports in 1979.

COMMODITY REVIEW

METALS

Aluminum.—Production capacity of the Naj Hammádí aluminum complex was scheduled to increase from 100,000 tons per year in 1978 to 160,000 tons per year in 1980. Alumina was imported from Australia through the Red Sea port of Safâga and transported 200 kilometers to Naj Hammádí. Approximately 25% of the output of the plant, operated by the state-owned Aluminum Company of Egypt, was consumed domestically. The remainder of production was exported to Western European countries and Japan.

Egypt proceeded with its plans to build a full range of aluminum extruding, fabricating, and finishing facilities. In 1977, an aluminum extrusion plant came onstream at Ismailia using aluminum pellets from Naj Hammádí. In 1978, an agreement was signed with Krupp A.G. (Federal Republic of Germany) for a joint venture in aluminum and zinc smelting. The plant was to produce 24,000 tons per year of rolled aluminum and zinc plates and strips.

Copper.—The Egyptian Geological Survey Organization continued its investigation of copper deposits in the Eastern Desert. Surveys indicated that deposits at Um Samiuki contained reserves of 150,000 tons of ore assaying 15.2% zinc, 1.15% copper, 1.10% lead, and 50 grams per ton of silver. Copper-nickel deposits at Gebel Homr and El Ghariba were estimated to contain 70,000 tons of 0.95% copper ore.

Iron and Steel.—The production of iron ore increased steadily from 1.4 million tons in 1977 to 1.45 million tons in 1978 and to approximately 1.5 million tons in 1979 as development work continued at the Bahariya Oasis deposits. Egypt also mined approximately 70,000 tons per year of 44% iron ore from smaller deposits at Aswan. The Bahariya deposits, located 300 kilometers southwest of Helwân, were eventually to yield 3.5 million tons per year of iron ore. Reserves at the major mine, El Gedida, were estimated at 120 million tons of 54% iron ore. Total reserves at Bahriya were estimated at 250 million tons. More than $500 million was invested in the development of the open pit mine and associated infrastructure.

With the full utilization of Bahariya ore and further operating improvements, the Helwân iron and steel complex was expected to reach a targeted output of 1.5 million tons per year of steel by 1980. Gas supplies from the Abu Gharadiq Field were to fuel the complex and replace coking coal previously imported from Poland and the U.S.S.R. Facilities at Helwân included an 80,000 ton-per-year heavy section mill, an 80,000-ton-per-year merchant bar mill, a 110,000-ton-per-year hot strip mill, and a 300,000-ton-per-year cold reduction mill. More than 90% of Helwân's production was sold domestically and Egypt remained a net importer of steel. Approximately 70,000 tons of steel products were exported to other Middle Eastern Countries in 1978.

Egypt's three other steelmaking facilities produced reinforcing rods for domestic use. These were the 100,000-ton-per-year Copper Works in Alexandria, the 80,000-ton-per-year Delta Steel Co. in Cairo, and the 250,000-ton-per-year Abu Zaabal Works in Abu Zaabal.

Construction was not yet begun on the proposed direct reduction steel plant at Dekhela. The $380 million plant was to be a joint venture including the Egyptian General Organization for Industrialization (50%), the Japanese firm C. Itoh and Co. Ltd. (25%), the West German firm Korf-Stahl A.G. (15%), and the Brazilian firm Companhia Vale de Rio Doce (10%). Using iron ore pellets imported from Brazil and natural gas from the Abú Qír Field, the plant was to produce 1.6 million tons per year of steel.

Manganese.—Manganese was produced at the Wadi Meialik deposits located in the Eastern Desert near the Sudanese border. Production at this location was becoming increasingly uneconomic owing to high transportation costs. Feasibility studies were to be conducted on the exploitation of the Umma Bogma deposits on the Sinai Peninsula, which had been mined until 1967. Reserves at Umma Bogma were estimated at 2 million tons of 21% manganese ore. The state-owned Sinai Manganese Co. was also to investigate the re-establishment of an associated ferromanganese facility at Abu Zenima. The plant, which had been near completion in 1967, had a production capacity of 10,000 tons per year of ferromanganese alloys. The overall project would include the provision of mining equipment, ore transport and shiploading facilities, the construction of a complex for the reduction and refining of ferruginous manganese ores, the rehabilitation of the company's township, and the provision of managerial and technical services.

Uranium.—The Nuclear Materials Corporation reported the existence of significant deposits of uranium in the Sinai and the Eastern Desert. The Nuclear Materials Corporation, a division of the Ministry of Electricity and Energy, was responsible for the exploration, mining, and processing of uranium, thorium, and other nuclear materials. Airborne surveys in 1978 identified a total of 7,000 radioactive anomolies in the country. Areas of El Missikat, El Atsham, and Qatrani were to undergo further investigation.

Extensive sampling and drilling were also carried out on the black sands along the Mediterranean coast and Nile Delta. A pilot plant was constructed for separating and processing the uraniferous sands. Monazite from the sands was shown to contain 5.2% thorium and 0.38% uranium. Reserves in the top layer (about 1 meter) were estimated at 14,700 tons of thorium and 1,070 tons of uranium. Additional resources were estimated at 280,000 tons of thorium and 20,000 tons of uranium. Phosphate deposits at Abu Tartûr were also estimated to contain 100,000 tons of uranium.

NONMETALS

Cement.—Egypt planned to double cement production capacity by 1983 through the expansion of existing facilities and the construction of new plants. Total installed capacity was rated at 4 million tons per year but owing to the age of the equipment at the older plants, production has declined to less than 3.3 million tons per year. Annual imports of cement were over 2 million tons. Cement plant capacity increases were planned as follows:

Location	Company	Start-up date	Current Capacity (thousand tons per year)	Planned Capacity (thousand tons per year)
Alexandria	Alexandria Portland Cement Co.	1948	500	1,000
Assiut	National Cement Co	1960	700	1,000
Helwân	Helwân Portland Cement Co.	1930	1,400	1,400
Torah	Torah Portland Cement Co	1929	1,400	2,400
Suez	Suez Cement Co	1981	--	1,000
Naj Hammâdi	National Cement Co	1983	--	1,000

Clays.—Kaolin production almost doubled in 1978 from previous levels owing to expansion in capacity at the Kalabsha deposits. Reserves at Kalabsha, located 105 kilometers southwest of Aswan, were estimated at 16 million tons of kaolin with a 38% alumina content. The Geological Survey Organization was examining the Kalabsha deposits, and also deposits of nepheline syenite in the Abou Khroug area of the Eastern Desert, for possible use in the production of aluminum. Egypt's remaining kaolin deposits were located near Umma Bogma in the Sinai Peninsula. The open-pit kaolin mines had been mined at the rate of 30,000 tons per year in 1966 and 1967, and studies were initiated on resuming the mining operation.

Fertilizer Materials.—Egypt's production capacity for nitrogenous fertilizer was estimated at 1.7 million tons per year. Capacity for the production of phosphatic fertilizer was 650,000 tons per year. Construction continued on Egypt's new fertilizer plants which were expected to make the country self-sufficient in fertilizer production by 1980. Egypts operating and projected fertilizer plants were as follows:

Location	Operator	Primary Product	Start-up Date	Capacity (thousand tons per year)
Suez	Société el Nasr d' Engrais et d' Industries Chimiques.	Calcium nitrate.	1951	275
Aswan	Egyptian Chemical Industries Co. (KIMA)	do	1960	400
Helwân	El Nasr Co. for Manufacturing Coke and Chemicals.	do	1964	140
Talkhá (I)	Société el Nasr d' Engrais et d' Industries Chimiques.	do	1975	365
Talkhá (II)	do	Urea	1980	570
Abú Qír	do	Urea	1979	500
Kafr-el-Zaiyat	Société Financiere et Industrielle d' Egypte S.A.	Single superphosphate.	1937	200
Abu Zaabal	Abu Zaabal Fertilizer and Chemical Co.	do	1948	200
Assiut	Société Financiere et Industrielle d' Egypte S.A.	do	1969	200
Kosseir	Kosseir Phosphate Co.	do	1958	50
Abu Zaabal	Abu Zaabal Fertilizer and Chemical Co.	Triple Superphosphate.	1980	175

Egypt's older nitrogenous fertilizer plants were designed to operate on locally available byproduct gases, namely coke oven gas and refinery gas. The Abú Qír plant, which came onstream in September 1979, used natural gas supplies from the Abú Qír Field. The Talkha II plant, which was to use natural gas from the Abu Madi Field, was to be the country's largest fertilizer facility. Daily production was to consist of 1,200 tons of ammonia, 1,700 tons of urea, and 180 tons of ammonium nitrate.

Egypt's phosphatic fertilizer plants all produced single superphosphate from rock phosphate and sulfuric acid. The plant under construction at Abu Zaabal was to produce 175,000 tons of triple superphosphate and 200,000 tons of phosphoric acid per year. Lurgi (Federal Republic of Germany) and Babcock-Moxley (United Kingdom) were contracted for construction of the plant which was to use phosphate rock from the West Sabaya mine.

Phosphates.—Egypt's phosphate production was expected to undergo a multifold increase as current operations were expanded and new deposits were exploited by 1985. Egypt's major phosphate companies were as follows:

Location	Company	Current Capacity (thousand tons per year)	Planned Capacity (thousand tons per year)	
Safaga, Kosseir	Red Sea Phosphate Co	150	0	(1980)
Hamrawein	Nasr Phosphate Co	600	1,200	(1980)
West Sabaya	El Nasr Phosphate Co	120	500	(1981)
Mahamid	El Nasr Phosphate Co	100	450	(1981)
Abu Tartur	Abu Tartur Phosphate Co	0	7,000	(1985)

In the Red Sea area of the Eastern Desert, the older Safaga and Kosseir mines were expected to be depleted by 1980. However, the nearby Hamrawein deposits, where reserves were estimated at 400 million tons, were to produce 1.2 million tons per year by 1980. In the Nile Valley, Seltrust Engineering (United Kingdom) was awarded a contract in 1978 to undertake technical and economic studies for the expansion of phosphate mining at West Sabaya and Mahamid. The studies were to include an assessment of ore reserves, the development of new mining methods, basic engineering for a new beneficiation plant, and evaluation of necessary infrastructure. Part of the production from the two mines would be used as feedstock for the Abu Zaabal fertilizer plant.

Egypt's most substantial phosphate deposits were located at Abu Tartûr in the Western Desert. Reserves were estimated at 1 billion tons with an average P_2O_5 content of 25.6%. In 1978, IBRD approved funding of $11 million for a complete feasibility study of the Abu Tartûr project. Engineering studies were being conducted by Sofremines of France and Alusuisse of Switzerland. In 1979, it was decided to reduce the scale of the project from the original production capacity of 10 million tons per year of ore owing to infrastructure and beneficiation problems.

Sulfur.—In 1979, Klockner A.G. (Federal Republic of Germany) was awarded a contract by Chama Sulfur Company for the construction of four sulfur grinding units near Alexandria. Scheduled to begin production in 1980, the plant was to grind 20,000 tons per year of sulfur rock into sulfur powder. At the same time, feasibility studies were being conducted on sulfur deposits in the Siwa Oasis area of northwest Egypt and at Ras Gemsa, 300 kilometers south of Suez. The Ras Gemsa deposit was mined from 1958 to 1963 with peak output reported at 7,000 tons per year.

Trona.—Egypt, one of the few sources of natural sodium carbonate, produced about 4,000 tons per year of trona in recent years. The major deposits were at Wadi Natrum, located northwest of Cairo. Sodium carbonate was used in the Misr Chemical Manufacturing Co. plant near Alexandria. The plant used imported and domestic sodium carbonate in the production of 45,000 tons of caustic soda, 5,000 tons of sodium bicarbonate, and 32,000 tons of heavy sodium carbonate per year.

MINERAL FUELS

Coal.—A feasibility study on reopening the Maghara coal deposits in the Sinai Peninsula was to be conducted. Egypt has imported all coal needs since the Maghara mines were closed in 1967. Located 90 kilometers southwest of El Arish, the Maghara deposits were estimated to contain reserves of 50 million tons of coal.

Natural Gas.—Egypt marketed approximately 100 billion cubic feet per year of gas with most of production directed towards power generation and industry. Natural gas reserves of the three major nonassociated gasfields, Abu Madi, Abû Qîr, and Abu Gharadiq, were estimated at 5 trillion cubic feet. The Egyptian General Petroleum Authority (EGPA) estimated that associated natural gas production from Suez Gulf oil operations totaled 280 million cubic feet per day, most of which was flared. In 1979, Egypt received a loan of $79 million from the IBRD to finance a project to gather, process, and transport the associated gas. The $170 million venture was to include gas-gathering stations, a natural gas liquids facility, compression units, pipelines, and related services.

Drilling began on new wells at the Abu Madi Field, located in the Nile Delta north of Port Said. Operated by EGPA, the Abu Madi Field produced 150 million cubic feet per day of gas for use in local industry and the new Talkhá fertilizer complex. The Abu Gharadiq Field was operated by the Faiyum Petroleum Company (FAPCO), a joint venture of EGPA and Amoco Egypt Oil Co.

Production at the rate of 90 million cubic feet per day was used to fuel steel and cement plants.

Initial production began at the Abú Qír Field operated by the Western Desert Petroleum Co. (WEPCO), a joint venture of EGPA and Phillips Petroleum Company. Output was to eventually reach 150 million cubic feet per day for use in nearby fertilizer and power plants. In 1978, EGPA also issued tenders for the execution of a natural gas distribution system in the Cairo residential districts.

Petroleum.—*Production.*—The Egyptian oil industry grew considerably in the last two decades despite the occupation by Israel from 1967 to 1975 of oilfields formerly operated in the Sinai Peninsula. In November 1979, Israel returned the offshore Alma field in the southeastern area of the Gulf of Suez. The Alma Field was expected to add 30,000 barrels per day to Egyptian production and contribute to the targeted output of 1 million barrels per day by 1982. Egyptian petroleum reserves were estimated at 2.45 billion barrels. EGPA supervised all exploration, production, refining, and marketing of crude and refined petroleum. Egypt was not a member of the Organization of Petroleum Exporting Countries (OPEC) and gradually increased the price of its Gulf of Suez blend export crude from $13.46 per barrel in January 1979 to $34.00 per barrel in December 1979.

The major area of oil production was the Gulf of Suez where oil was discovered in 33 structures, of which 20 were producing in 1978 and 1979. The Gulf of Suez Petroleum Company (GUPCO), a joint venture of EGPA and Amoco, produced about 75% of Egypt's oil output. GUPCO's production was from three major fields—El Morgan, July, and Ramadan—and was scheduled to increase as the three new fields brought onstream in 1977 were further developed.

Production from oilfields in the Sinai Peninsula accounted for about 17% of total output. Cie. Orientale des Petroles d'Egypte (COPE), a joint venture of EGPA and the Italian firm Ente Nazionale Idrocarburi (ENI), boosted production from the main Sinai field, Abu Rudeis, to an average of 50,000 barrels per day. In 1978, EGPA and ENI formed a new joint company, PETROBEL, for oil and gas exploration and production in the Sinai Desert. ENI was to be responsible for the technical and financial studies and would recover its cost in crude oil allotments.

The General Petroleum Company (GPC), owned totally by the Egyptian Government, produced a small amount of oil from its seven fields in the Eastern Desert. Oil production from the Umm-el-Yusr North Field began in 1979 at a rate of 2,500 barrels per day. Other small producing companies, all of which operated fields in the Western Desert, were WEPCO, FAPCO, and the Nile Valley Petroleum Co. (NIPCO). In 1978, Agypteco Oil and Gas Exploration Co. (Federal Republic of Germany) signed an agreement to further delineate and develop the Meleiha Field, located near Mersa Matruh in the Western Desert.

Exploration.—Since 1973, Egypt signed a total of 53 agreements with about 30 foreign oil companies for onshore and offshore oil exploration. Under production-sharing agreements, the companies committed a total of $970 million for exploration work for the years 1974 to 1982 covering an acreage of nearly 500,000 square kilometers. In 1978 and 1979, 13 new agreements were concluded. It was estimated that by yearend 1978, $400 million of the total commitment had been expended on exploration activities.

The Gulf of Suez Basin proved to be the most prospective area for oil finds with several new structures discovered in 1978 and 1979. Deminex (Federal Republic of Germany) planned to develop its discovery in the North Belayim offshore concession area, which was estimated to contain recoverable oil reserves of 400 million barrels. The Egyptian Petroleum Development Co. (Epecico) (Japan) planned to start commercial production for its West Bakr discovery in mid-1980. New agreements were signed with Quintana (United States) for a 135-square-kilometer tract at East Shvkheir; the International Egyption Oil Co.(IEOC), a joint venture of EGPA and ENI, for a 2,400 square kilometer with a concession offshore Port Said and the Compagnie Francaise des Petroles for a 400-square-kilometer tract at Nabwi.

The Egyptian Government enacted provisions to increase exploration efforts in the Western Desert, which covered 500,000 square kilometers south of the Mediterranean Coast. Under new production-sharing agreements, oil companies would recover all approved development costs within 1 year from the date of expenditure from crude oil allocations; remaining output would be shared equally with EPGA. Shell Winning N.V., a subsidiary of Royal Dutch/Shell, signed an exploration agreement for a

32,700-square-kilometer area near the Qattara Depression. Other exploration areas included the Nile Delta, the Nile Basin, the Red Sea, and the Eastern Desert. In the Nile Delta, ELF-ERAP (France) encountered a substantial gas find in its 2,600-square-kilometer concession area. Further drilling was underway and the company was reported to be considering a project for the production of liquified natural gas.

In 1979, Israel returned over 22,000 square kilometers both onshore and offshore northern Sinai. Egypt had already concluded several exploration agreements for this area and the remainder was opened to bidding in 1,200-square-kilometer blocks. Conoco Suez Ltd. obtained an 866-square-kilometer tract in the al-Qa Plain near al-Tur in southwest Sinai. British Petroleum Ltd. (BP) signed a production-sharing agreement for a 700-square-kilometer area near Ras Muhammad and pledged to spend $19 million over an 8-year period.

Refining.—Approximately 50% of Egypt's petroleum production was refined locally in six refineries operated by three public companies. Some petroleum products were imported from Italy, Greece, and France. Refining capacity was to be increased from 85 million barrels per year to 110 million barrels per year by 1980 when Egypt would become a net exporter of petroleum products. Capacities of Egypt's refineries were as follows:

Company	Location	Capacity (thousand barrels per year)
Suez Petroleum Co	Suez	10,000
	Musturud	25,000
	Tanta	10,000
El Nasr Petroleum Co	Suez	7,000
	Amreya	15,000
Alexandria Petroleum Co	Alexandria	15,000

In 1978, Alexandria Petroleum Co. contracted C.E. Lummus Inc. to provide basic engineering services for a lubricating oil complex to be constructed near its refinery. The $100 million plant was to have an annual product of 84,000 tons of lube oil, 16,000 tons of cylinder oil, 100,000 tons of asphalt, and 11,000 tons of microwax.

Several petrochemical projects were also under study. The Petrochemical Projects Group contracted Montedison (Italy) for design and engineering work for a petrochemical industry to be located in Amreya. Using naptha and propane as feedstock, the plant was to produce 100,000 tons of low-density polyethylene, 30,000 tons of high-density polyethylene, and 60,000 tons of polyvinyl chloride per year.

A new plant was to be constructed in Musturud to produce paraxylene from Musturud refinery reformate. Production of 40,000 tons per year was scheduled for 1982. The paraxylene would be used by the Amreya petrochemicals complex in the production of synthetic fibers. The El Nasr Petroleum Co. awarded Badger Ltd. a contract for technical and economic studies for a carbon black manufacturing facility. At present, all Egypt's carbon black requirements are imported. Located in Alexandria, the plant would have a 10,000-ton-per-year capacity.

Pipelines.—The second line of the SUMED pipeline was inaugurated in September 1978, bringing total capacity to 590 million barrels per year. Construction work on the twin 320-kilometer, 42-inch pipeline began in April 1974. SUMED was operated by the Arab Petroleum Pipeline Co. owned by EGPA (50%), Saudi Arabia (15%), Kuwait (15%), the United Arab Emirates (15%), and Qatar (5%). The pipeline, which connected Suez and Alexandria on the Mediterranean, operated at a rate of 1.4 million barrels per day in 1978 and 1.6 million barrels per day in 1979. Almost 50% of the pipeline's capacity was reserved by seven major oil companies. Saudi Arabia also indicated interest in using the SUMED pipeline in conjunction with its new Abqaiq-Yanbu transpeninsular line to ship Saudi crude oil to Western Europe. Beginning in 1982, Saudi Arabia would put through the SUMED pipeline up to 1 million barrels per day of oil under a service contract.

The Mineral Industry of Finland

By Joseph B. Huvos[1]

In 1979 Finland's gross domestic product was boosted by 7% to $47 billion[2 3] by a 10% increase in exports, mainly forestry products, but the level of activities in mining and quarrying was not significantly changed. Mining and quarrying contributed to about 1.5% to the gross national product. The entire mineral industry, including processing of mineral and other manufacturing, contributed about 31%. Inflation was down to under 8%, and efforts were focused on lowering the 6.2% unemployment rate.

There were several important events in the Finnish mineral industry. Operations started at Outokumpu Oy's Vammala metal mine, Rautaruukki Oy's Mustavaara iron ore-vanadium pentoxide mine, the Olikluoto nuclear powerplant, and at a dolomite mine. Rautaruukki Oy continued construction under contract at the Kostamus mine in the U.S.S.R., from which it was to receive iron pellets; construction also continued at Kemira Oy's Siilinjärvi apatite mine.

In order to replenish the diminishing reserves of ores and minerals, the Ministry for Trade and Industry has launched a 3-year prospecting competition, as a result of which several promising ore deposits have been found, mostly in central and eastern Finland, in particular at Pielavesi, Keitele, Kiuruvesi, and Rautavaara. The deposits contain iron, nickel, copper and chromium.

PRODUCTION AND TRADE

Production of mineral commodities in 1976, 1977, 1978, and 1979 is shown in table 1. For the third consecutive year Finland ran a trade and a current account surplus. The U.S.S.R., Sweden, and the United Kingdom were the country's largest trading partners. Finland's mineral commodity trade in 1977 and 1978 are shown in tables 2 and 3.

Table 1.—Finland: Production of mineral commodities

(Metric tons unless otherwise specified)

Table 2.—Finland: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum metal including alloys:			
Scrap	18	644	All to West Germany.
Unwrought	3,248	2,652	Japan 1,251; Sweden 978; United Kingdom 319.
Semimanufactures	17,557	38,580	Denmark 3,800; Norway 3,298; United Kingdom 2,819.
Cadmium metal including alloys, all forms	472	507	Italy 151; United Kingdom 114; United States 111.
Chromium: Chromite	508,305	364,461	Sweden 292,300; United States 41,945; Canada 13,084.
Cobalt metal including alloys, unwrought and semimanufactures	999	853	United States 244; United Kingdom 181; Canada 163.
Copper metal including alloys:			
Scrap	338	218	Denmark 159; Sweden 29; Italy 15.
Unwrought, including matte	37,328	17,542	East Germany 7,463; West Germany 5,222; United States 878.
Semimanufactures	21,039	26,865	United Kingdom 5,219; Sweden 4,912; France 3,181.
Gold metal, unworked or partly worked troy ounces	3,569	4,710	West Germany 2,633; Netherlands 833; Sweden 421.
Iron and steel:			
Ore and concentrate, except roasted pyrite	1,165	13,302	Netherlands 5,197; United Kingdom 5,160; West Germany 2,922.
Metal:			
Scrap	3,235	973	Mainly to West Germany.
Pig iron, spiegeleisen, similar materials	71,879	[1]1,696	West Germany 990; Poland 699.
Ferroalloys	27,009	42,802	Sweden 17,960; West Germany 11,519.
Steel, primary forms	214,188	187,452	Sweden 65,782; Ecuador 54,539; United Kingdom 30,647.
Semimanufactures	742,247	998,248	United States 192,791; West Germany 178,983; Sweden 174,066.
Lead:			
Ore and concentrate	--	2,022	West Germany 1,980; Denmark 42.
Metal including alloys:			
Scrap	65	342	West Germany 301; Sweden 41.
Unwrought	1,303	808	Denmark 382; Sweden 237; United Kingdom 100.
Semimanufactures	36	214	Norway 92; Iceland 61; Austria 25; Sweden 19.
Mercury 76-pound flasks	336	403	Belgium-Luxembourg 220; United States 72; Sweden 49.
Nickel metal including alloys:			
Unwrought	7,928	5,882	United States 1,631; France 1,541; United Kingdom 847.
Semimanufactures	30	11	Ecuador 4; Portugal 4; Sweden 3.
Platinum-group metals including alloys troy ounces	939	13	NA.
Silver metal including alloys thousand troy ounces	577	722	Sweden 411; West Germany 211; Netherlands 64.
Tin metal including alloys:			
Scrap	40	79	West Germany 39; United Kingdom 28; Sweden 12.
Unwrought	46	4	Sweden 3.
Semimanufactures	1	1	NA.
Titanium oxides	5,010	2,264	Mainly to Sweden, United States, Hungary.
Vanadium compounds	3,450	4,931	West Germany 1,744; Sweden 1,016; United Kingdom 735.
Zinc:			
Oxide	226	596	Israel 581; Nigeria 10.
Metal including alloys:			
Scrap	474	6	NA.
Unwrought	124,165	113,605	United Kingdom 39,847; United States 24,788; Sweden 14,931.
Semimanufactures	159	65	U.S.S.R. 41; Sweden 11; United Kingdom 10.
Other:			
Ash and residue containing nonferrous metals	942	1,929	West Germany 791; United Kingdom 435; Belgium-Luxembourg 326.
Waste and sweepings of precious metals kilograms	8,924	11,254	France 4,864; West Germany 2,466; Sweden 2,001.
Base metals, n.e.s	3	1	All to West Germany.

See footnotes at end of table.

Table 2.—Finland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	(2)	--	
Grinding and polishing wheels and stones	50	36	Brazil 19; Sweden 9; Saudi Arabia 2.
Asbestos	3	--	
Cement	36,673	76,665	Sweden 43,644; U.S.S.R. 31,413; Norway 1,175.
Chalk	(2)	65	All to Nigeria.
Clays and clay products (including all refractory brick):			
Crude:			
Kaolin	--	114	Sweden 112.
Other	470	714	Sweden 651; Iraq 4.
Products:			
Refractory	171	2,154	U.S.S.R. 1,340; Sweden 335; United Kingdom 306.
Nonrefractory	273	230	Sweden 111; U.S.S.R. 81.
Diamond, natural and manufactured, gem and industrial carats	1,250	200	Mainly to Sweden.
Diatomite and other infusorial earth	8	8	NA.
Feldspar, leucite, nepheline syenite	52,466	54,082	United Kingdom 33,064; West Germany 4,981.
Fertilizer materials, manufactured:			
Nitrogenous	3,301	41,149	Mexico 14,680; Turkey 12,000; Hungary 11,745.
Phosphatic	--	7	NA.
Potassic	18,671	NA	All to Cuba and Morocco.
Other, including mixed	10,576	120,542	China, mainland, 36,050; Thailand 22,512; Philippines 13,500.
Lime	73	318	U.S.S.R. 226.
Precious and semiprecious stones, except diamond:			
Natural kilograms	1,127	1,666	United States 1,323; Sweden 141; West Germany 120.
Manufactured do	(2)	1	Mainly to United Kingdom.
Salt, excluding brine	7	52	Mainly to U.S.S.R.
Sodium compounds, n.e.s.: Caustic soda	--	3	NA.
Stone, sand and gravel:			
Dimension stone	78,079	101,309	Italy 47,146; France 22,909; West Germany 12,300.
Dolomite	34	--	
Limestone	14,953	11,103	Sweden 9,817; Denmark 1,108; West Germany 100.
Quartz and quartzite	1,433	1,086	Norway 518; Sweden 318; Iran 240.
Crushed and broken stone and gravel	17,684	134,473	Sweden 127,157; U.S.S.R. 7,260.
Sand, excluding metal bearing	31,124	90,846	Sweden 88,978; U.S.S.R. 999; Iran 775.
Sulfur:			
Elemental, all forms	1,633	8	NA.
Sulfuric acid	223,004	113,128	Netherlands 49,128; West Germany 24,532; Spain 11,888.
Talc and steatite	31,876	27,609	Sweden 7,363; Poland 6,565; U.S.S.R. 3,163.
Other:			
Crude, unspecified	9,912	6,254	West Germany 2,158; Spain 1,253; Italy 824.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture	--	30	NA.
Slag and ash, n.e.s	(2)	13	NA.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	--	436	All to U.S.S.R.
Carbon black	8	11	Mainly to Nigeria.
Coal, anthracite	5	--	
Hydrogen, helium, rare gases kilograms	500	1,400	Saudi Arabia 1,100.
Peat, including peat briquets and litter	13,047	17,241	Netherlands 5,374; Libya 2,708; United Kingdom 2,447.
Petroleum refinery products:			
Gasoline thousand 42-gallon barrels	12	4,923	Sweden 3,038; United Kingdom 646; Netherlands 540.
Kerosine do	(2)	(2)	NA.
White spirit do	636	471	Netherlands 212; Belgium-Luxembourg 109; United Kingdom 108.
Jet fuel do	--	154	All to Sweden.
Distillate fuel oil do	561	3,950	Sweden 2,072; West Germany 935; Denmark 391.
Residual fuel oil do	5,770	3,459	Sweden 1,965; Denmark 976; United Kingdom 417.

See footnotes at end of table.

Table 2.—Finland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
MINERAL FUELS AND RELATED MATERIALS —Continued			
Petroleum refinery products —Continued			
Lubricants thousand 42-gallon barrels	95	124	U.S.S.R. 57; Nigeria 50; France 11.
Other:			
Liquefied petroleum gas do	5	64	United Kingdom 40; France 14; Denmark 7.
Mineral jelly and wax do	32	12	Sweden 7; West Germany 3; Norway 1.
Nonlubricating oils, n.e.s do	4	4	Sweden 3.
Bitumen and bituminous mixtures, n.e.s do	15	3	U.S.S.R. 2.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	1	--	

NA Not available.
[1]Excludes quantity valued at $11,859,654.
[2]Less than 1/2 unit.

Table 3.—Finland: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Ore and concentrate	76	265	Denmark 177; West Germany 88.
Oxide and hydroxide	17,820	24,333	Hungary 14,049; China, mainland, 4,907; West Germany 2,559.
Metal including alloys:			
Unwrought	28,550	21,724	U.S.S.R. 8,350; Norway 4,598; Hungary 3,771.
Semimanufactures	25,051	24,410	Sweden 5,915; West Germany 4,793; Norway 2,850.
Antimony metal including alloys, all forms	5	39	Denmark 20; Yugoslavia 4; Belgium-Luxembourg 3.
Arsenic trioxide, pentoxide, acids	773	--	
Beryllium metal including alloys, all forms kilograms	([1])	100	All from Sweden.
Cadmium metal including alloys, all forms do	100	13,300	Canada 12,400.
Chromium:			
Chromite	5,285	--	
Oxide and hydroxide	527	296	Poland 100; U.S.S.R. 91; West Germany 73.
Cobalt:			
Oxide and hydroxide	52	15,252	East Germany 14,492.
Metal including alloys, all forms	126	306	Netherlands 301.
Copper:			
Ore and concentrate	11,813	4,192	Canada 2,708; Cuba 1,482.
Copper sulfate	1,436	368	West Germany 149; United Kingdom 88; U.S.S.R. 56.
Metal including alloys:			
Scrap	171	366	United States 296; Sweden 69.
Unwrought	10,508	14,333	West Germany 6,732; U.S.S.R. 5,005; Zambia 865.
Semimanufactures	8,528	7,859	Sweden 3,059; West Germany 1,716; United Kingdom 1,547.
Gold metal, unworked or partly worked troy ounces	76,191	67,333	West Germany 27,135; United Kingdom 20,056; Switzerland 6,282.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	1,166	1,530	Sweden 1,010; U.S.S.R. 329; Norway 166.
Metal:			
Scrap	63,215	22,832	U.S.S.R. 22,783.
Pig iron, including cast iron	548	2,212	Sweden 1,365; Canada 606; Norway 140.
Sponge iron, powder, shot	3,765	4,303	Sweden 2,234; United Kingdom 776; Spain 677.
Ferroalloys	26,670	33,030	Norway 14,948; U.S.S.R. 11,184; Sweden 2,158.
Steel, primary forms	10,338	15,726	Sweden 14,639.
Semimanufactures:			
Bars, rods, angles, shapes, sections	130,958	140,873	Sweden 44,095; West Germany 15,939; Czechoslovakia 14,791.
Universals, plates, sheets	140,521	99,587	Sweden 21,069; West Germany 18,048; Czechoslovakia 15,473.
Hoop and strip	25,354	23,811	West Germany 6,881; United Kingdom 5,045; Sweden 4,996.

See footnotes at end of table.

Rails and accessories	1,809	2,752	West Germany 1,696; Sweden 398; Belgium-Luxembourg 358.
Wire	11,983	11,570	Sweden 3,000; France 2,492; Belgium-Luxembourg 1,492.
Tubes, pipes, fittings	74,970	83,956	West Germany 20,476; United Kingdom 13,752; Sweden 8,711.
Lead:			
Oxides	108	152	East Germany 90; West Germany 53; United States 7.
Metal including alloys:			
Unwrought	14,612	12,332	U.S.S.R. 6,242; Sweden 5,607.
Semimanufactures	566	637	Denmark 316; West Germany 185; United Kingdom 55.
Magnesium metal including alloys, all forms	210	89	Norway 69; West Germany 12; United Kingdom 7.
Manganese:			
Ore and concentrate	17,297	19,737	Netherlands 9,964; Republic of South Africa 9,428.
Oxides	1,293	2,068	China, mainland, 1,020; Netherlands 810; Belgium-Luxembourg 121.
Mercury 76-pound flasks	281	316	Sweden 174; Spain 130.
Molybdenum:			
Ore and concentrate	269	40,111	United States 27,706; Sweden 12,349.
Metal including alloys, all forms	91	2	Mainly from Austria and United States.
Nickel:			
Ore and concentrate	13,193	14,275	All from Norway.
Metal including alloys:			
Scrap	1,749	924	United States 618; United Kingdom 86; West Germany 80.
Unwrought	3,284	4,547	United States 1,553; French Oceania 1,451; Australia 797.
Semimanufactures	112	49	Australia 14; West Germany 11; United States 11.
Phosphorus, elemental	2	8	West Germany 5.
Platinum-group metals troy ounces	6,023	7,867	France 4,501; United Kingdom 1,582; Sweden 1,328.
Silver metal including alloys thousand troy ounces	1,851	1,564	West Germany 641; United Kingdom 594; Sweden 187.
Silicon, elemental	402	441	Sweden 420; Norway 20.
Tin:			
Oxides	1	--	
Metal including alloys:			
Scrap	--	13	All from United States.
Unwrought	121	211	West Germany 76; United Kingdom 44; Sweden 40.
Semimanufactures	110	111	United Kingdom 81; West Germany 15; Norway 5.
Titanium:			
Ore and concentrate	10,368	6,399	Norway 4,980; Republic of South Africa 971; Australia 253.
Oxides	71	95	United States 59; Norway 18; West Germany 15.
Tungsten:			
Ore and concentrate	2	([1])	NA.
Metal including alloys, all forms	31	29	United States 14; West Germany 10.
Zinc:			
Ore and concentrate	127,162	169,199	Denmark 82,355; Sweden 52,687; Peru 34,157.
Oxides	245	347	United Kingdom 218; Sweden 54; Canada 42.
Metal including alloys:			
Scrap	21	--	
Blue powder	284	459	Norway 404; United Kingdom 55.
Unwrought	1,533	197	West Germany 138; United Kingdom 33; Belgium-Luxembourg 10.
Semimanufactures	491	671	Norway 417; United Kingdom 82; Sweden 59.
Zirconium ore and concentrate	7	3,067	NA.
Other:			
Ores and concentrates	171	860	All from Norway.
Ash and residue containing nonferrous metals	2,344	2,566	United States 1,650; Sweden 672; United Kingdom 108.
Metals including alloys, all forms:			
Metalloids, n.e.s	13	4	Mainly from West Germany and Japan.

See footnotes at end of table.

METALS —Continued			
Other —Continued			
Metals including alloys, all forms —Continued			
Pyrophoric alloys	1	--	
Base metals, n.e.s	136	140	Sweden 67; Republic of South Africa 37; Denmark 18.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	88	101	Italy 40; West Germany 26; United Kingdom 11.
Dust and powder of precious and semiprecious stones, except diamond kilograms	5	3	NA.
Grinding and polishing wheels and stones	1,666	1,667	Sweden 312; United States 312; Austria 289.
Asbestos	5,624	5,415	U.S.S.R. 2,435; Canada 1,694; Republic of South Africa 776.
Barite and witherite	1,154	952	West Germany 731; United Kingdom 120; China, mainland, 60.
Borates, crude, natural	12,812	15,748	United States 8,445; Turkey 7,300.
Cement	6,265	7,056	Denmark 4,224; U.S.S.R. 1,163; United Kingdom 888.
Chalk	12,692	9,286	West Germany 3,715; United Kingdom 2,049; Denmark 2,014.
Clays and clay products (including all refractory brick):			
Crude:			
Kaolin	361,648	330,644	United Kingdom 317,751; Brazil 8,810; East Germany 2,178.
Other	15,394	22,436	United Kingdom 14,718; United States 3,740; West Germany 3,594.
Products:			
Refractory (including nonclay brick)	57,313	52,235	United Kingdom 15,517; Sweden 10,133; West Germany 9,191.
Nonrefractory	3,157	5,942	U.S.S.R. 5,119; Sweden 755.
Cryolite and chiolite	53	37	Denmark 36.
Diamond, industrial carats	10,750	11,650	Belgium-Luxembourg 5,400; Netherlands 3,650; United Kingdom 850.
Diatomite	1,281	1,295	United States 654; Iceland 280; United Kingdom 203.
Feldspar, leucite, nepheline syenite	162	1,917	Denmark 1,838.
Fertilizer materials:			
Crude, phosphatic	407,366	492,806	U.S.S.R. 127,404; Senegal 101,633; Morocco 98,196.
Manufactured:			
Nitrogenous	24,299	31,609	Norway 9,965; U.S.S.R. 6,057; East Germany 6,004.
Phosphatic	265	204	Mainly from West Germany.
Potassic	240,684	243,382	East Germany 119,652; U.S.S.R. 87,139; West Germany 36,591.
Other, including mixed	699	1,286	Belgium-Luxembourg 720; Sweden 296; United Kingdom 183.
Ammonia	94,326	103,767	U.S.S.R. 52,938; United Kingdom 14,999; Mexico 14,944.
Fluorspar	6,383	2,204	Thailand 1,317; East Germany 338; Sweden 322.
Graphite, natural	181	104	West Germany 48; Norway 30; Sweden 22.
Gypsum and plasters	125,369	83,558	Spain 57,624; U.S.S.R. 20,686; Sweden 3,121.
Lime	26	17	NA.
Magnesite	1,215	7,176	U.S.S.R. 4,466; Netherlands 1,138; Norway 1,033.
Mica, all forms	292	270	United Kingdom 182; West Germany 30; China, mainland, 20.
Pigments, mineral:			
Natural, crude	66	--	
Iron oxides, processed	3,033	2,871	West Germany 2,726.
Precious and semiprecious stones, except diamond:			
Natural kilograms	2,477	2,082	India 800; West Germany 496; Brazil 378.
Manufactured do	100	83	Switzerland 52; West Germany 14; Austria 13.
Salt, excluding brine	482,916	547,251	Netherlands 295,361; Poland 74,200; East Germany 62,458.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	66,067	72,419	West Germany 26,974; Belgium-Luxembourg 20,809; France 19,048.
Caustic potash	456	474	East Germany 240; West Germany 107; Sweden 77.

See footnotes at end of table.

Table 3.—Finland: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
NONMETALS —Continued			
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	517	1,331	Norway 874; Sweden 121; Italy 52.
Worked	500	359	Sweden 198; Italy 84; Portugal 57.
Dolomite, chiefly refractory grade	18,937	17,540	Belgium-Luxembourg 13,922; Norway 1,716; West Germany 1,448.
Gravel and crushed rock	6,255	5,204	Sweden 2,675; Norway 1,543; Denmark 764.
Limestone, except dimension	607,601	627,693	Sweden 617,787; Spain 5,500; United Kingdom 4,204.
Quartz and quartzite	218	276	Portugal 100; Sweden 69; United States 50.
Sand, excluding metal bearing	53,949	106,037	Norway 62,360; Belgium-Luxembourg 26,969; Denmark 9,300.
Sulfur:			
Elemental	29,696	28,439	France 16,606; Poland 9,175; Sweden 2,300.
Sulfuric acid	175	69	West Germany 33; Belgium-Luxembourg 20; Netherlands 8.
Talc and steatite	656	656	Belgium-Luxembourg 190; Norway 166; United States 67.
Other:			
Crude	14,238	1,800	Republic of South Africa 1,011; Sweden 280; Denmark 176.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture	17,693	7,581	Sweden 6,479.
Slag and ash, n.e.s	1,980	2,550	All from Norway.
Oxides and hydroxides of magnesium, strontium, barium	12,670	1,245	East Germany 600; Netherlands 238; U.S.S.R. 174.

COMMODITY REVIEW

METALS

Chromite.—Outokumpu Oy continued production of chromite ore at Kemi on the Gulf of Bothnia from the new Viia open pit mine at a rate of 800,000 tons per year. The former Elijärvi pit nearby has been depleted. The chromite ore averages 26% Cr_2O_3 and has a Cr-to-Fe ratio of 1.55. Total ore reserves are about 20 to 30 million tons.[4] The main product is a concentrate containing 40% to 42% Cr_2O_3, which is used at the company's Tornio ferrochrome plant. Some concentrate containing 45% to 47% Cr_2O_3 and 2% SiO_2 is exported or used for foundry sand.

Recently the Geological Research Institute discovered a new chrome ore deposit at Kotelaisen Kaira in Sodankylä, Finnish Lappland. Several square kilometers are covered by the deposit containing 14% chromium and traces of platinum and palladium.

Copper, Nickel, Lead, and Zinc.—Outokumpu Oy started operations at its Vammala Mine, located east of Pori, Southwest Finland. About 350,000 tons of ore is to be extracted from a deposit expected to last for 10 years. The ore contains 0.7% nickel and 0.4% copper.

Ore mined by Outokumpu decreased in 1978 to 5.8 million tons. Metal production was also slightly lower, with cathode copper amounting to 42,700 tons, cathode nickel to 7,500 tons, zinc to 133,000 tons, and cobalt products to 930 tons. Besides Outokumpu Oy's nine metallic ore mines and processing plants and three smelters (Harjavalta, Pori, Kokkola), Myllikoski Oy operated one copper mine at Luikonlahti, located near Outokumpu, which sold its ores to Outokumpu Oy.

Iron Ore.—Total ore production of Rautaruukki Oy's three mines, Otanmäki, Rautavaara, and Mustavaara, located in northern and central Finland, was 3.8 million tons in 1978, yielding 785,000 tons of iron concentrate. This quantity and imports of 1.5 million tons of iron ore were used by Rautaruukki Oy for making steel at Raahe. Work continued under contract in the U.S.S.R. near the Finnish border at Polvijärvi (Kostamus) on the construction of an iron ore mine and concentrator to supply iron ore pellets to Finland starting in 1980.

Iron and Steel.—Finland's steel production was controlled mainly by Government-owned Rautaruukki Oy (72%) with steelworks at Raahe on the Baltic. Ovako Oy accounted for 23% and the Wartsila concern at Dalsbruk, south Finland, accounted for about 3%. Outokumpu Oy (2% of steel production) controlled the Tornio plant on the Baltic, including production of 44,800 tons of ferrochrome and 44,300 tons of rolled alloyed steel products in 1978.

Vanadium.—In September, Rautaruukki Oy officially opened its Mustavaara vanadium pentoxide mine, located in Suomussalmi municipality. Production was held up in 1977 and early in 1978 by problems in the sintering plant. Output in 1977 was 1,124 tons of vanadium pentoxide, far short of the 3,000 tons per year nominal capacity of the mine. The company's Otanmäki vanadium pentoxide mine, located in Vuolijoki municipality, produced 2,207 tons of pentoxide in 1977. In 1978, total Finnish vanadium pentoxide production was 5,000 tons.

NONMETALS

Apatite.—Development work continued at Kemira Oy's Siilinjärvi apatite mine, north of Kuopio. Test runs at the mine and processing plant were planned for 1979. Capacity of the mine is 2 million tons of ore with an apatite content of 10%. When in production, the mine is to supply about 10% of the country's apatite requirements. Startup is planned for 1980.

Cement.—Paraisten Kalkki Oy operated three cement plants, located at Pargas (south coast), Lappeeranta (southeast), and Kolari (Finnish West Lappland) totaling 1.85 million tons capacity. Oy Lohja AB operated the 850,000-ton Virkby plant near Lohja.

Dolomite.—A dolomite mine was started at Siikainen, north of Pori, southwest Finland. The importance of the 180,000-ton-per-year mine lies in the fact that it supplies magnesium, which is deficient in the soil of west Finland.

Ilmenite.—In 1978, Rautaruukki Oy's Otanmäki iron ore mine produced 132,000 tons of ilmenite concentrate. Domestic ilmenite production and some imported ore were used to make titanium pigment at Kemira Oy's Pori plant. The pigment was mainly exported.

MINERAL FUELS

Hydroelectric power, peat, fuelwood, and industrial waste supplied barely 15% of Finland's energy requirements, the rest was supplied by imports of crude oil, natural gas, nuclear fuel, and coal.

Coal.—Preliminary studies were underway to build a port for bulk coal carriers of 100,000 deadweight tons. This would make it possible for the country to diversify away from imports of Polish coal. No domestic coal is mined in Finland.

Nuclear Power.—Test runs were made at the country's second nuclear powerplant site at Olkiluoto (west coast) on the first of two 660-megawatt units built by the Swedish ASEA-Atom for Immatran Voima Oy (IVO, Electric Utility of Finland). One 440-megawatt unit of two, built at Lovisa (south coast) by the U.S.S.R. has been operating since 1977. Startup of the second Lovisa unit has been postponed until 1980 to correct faults in the pressure vessel.

According to an official study, energy consumption is expected to slow down during the 1980s because of the high cost of energy and strong conservation measures. Consequently, construction of additional nuclear powerplants may be delayed.

Peat.—According to Finland's first energy program, drafted by the Energy Policy Council chaired by the Trade and Industry Minister, the production of peat is to be increased from the present 6 million cubic meters per year to 20 million cubic meters by 1985 to substitute for imports of 2 million tons per year of crude oil.

Petroleum and Natural Gas.—In 1979 Finland had no crude oil production, and the Finnish State oil company, Neste Oy, had a monopoly to import and refine petroleum. The company had two refineries with total capacity of 15 million tons per year, one located at Naantali on the west coast and the other at Porvoo on the south coast.

An official report recommended to increase gas imports from the U.S.S.R. from the present 1 billion cubic meters per year to 2 billion and subsequently to 3 billion cubic meters per year. The present 125-kilometer-long, 28-inch gas pipeline is to be extended from Kouvola to Lahti and later to Helsinki. Neste Oy estimates that gas could reach Lahti by 1981, Tampere in 1984, and Helsinki a year later. At present, there is a 40-kilometer, 16-inch pipeline from Kouvola to Kotka (south coast).

Uranium.—The Geological Research Institute has discovered a deposit of 330,000 tons of uranium ore at Kittilä in Finnish Lappland, assaying an average 0.2% uranium.

The Mineral Industry of France

By Roman V. Sondermayer[1]

France, which extracts small quantities and has sizable imports of minerals, continued during 1978-79 among the largest processors of minerals and petroleum in Europe. However, activities of the minerals industry, when compared with that of 1977, showed slowdowns in expansions and modernization of mining and processing facilities; mining was fairly significant to the French economy as a source of employment in certain regions.

During 1978 and 1979, France reorganized Government agencies dealing with minerals and announced a new mineral and energy policy. The reorganization was complex and put most of the activities relating to crude materials under the Direction of Générale de l'Energie et de Matières Premières in the Ministry of Industry (Ministère de l'Industrie). The mineral plan and the energy plan both expressed concern about France's dependence on imports of minerals, metals, and energy. In the field of minerals, emphasis was on discovery and development of domestic resources and a goal was set to lower dependency on foreign minerals from 85% to 80% by 1985. In the field of energy, dependence on foreign supplies was to be lowered mostly by development of nuclear energy and to a lesser extent by development of solar energy and by conservation.

Major events in the mineral industry during the years in review were accelerated exploration by the Bureau de Recherches Géologiques et Minières (BRGM); restructuring of the steel industry; startup of a new nickel electrolytic plant, unfortunately damaged by fire; the beginning of pilot production in a new opencast tungsten mine; completion of an aerial tramway in a talc mine; and closure of a petroleum refinery.

PRODUCTION

Table 1 shows the latest figures and trends of the output of French minerals and related products. Private companies and State-owned corporations produced minerals at home and abroad. The Government-owned BRGM remained an important instrument of the Government in securing raw materials for the domestic economy by exploration and ventures abroad.

Unspecified ----do----	[r]49,096	32,348	82,755	87,950
Refinery fuel and losses ----do----	53,793	52,689	50,771	[3]54,691
Total ----do----	902,197	873,504	927,689	978,051

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]Although output reported is at the smelter stage of production rather than at the mine stage and thus could include metal contained in ores mined in other countries, it is believed that any such production derived from ores from other countries is not duplicative to any significant extent of mine production reported for other countries.
[2]Revised to none.
[3]Reported figure.
[4]Includes smectic clay.
[5]Includes material for the glass industry as well as for ceramic use.
[6]Excludes bituminous material.

TRADE

Tables 2 and 3 show details on foreign trade of France for the latest years for which complete data were available. Mineral fuels, petroleum in particular, were the largest import items. The United States imported about $335 million more in minerals than it exported to France; principal U.S. imports were among the iron and steel and radioactive materials. Coal, radioactive materials, copper, aluminum, nickel, phosphates, and diamonds were the principal commodities the United States exports to France.

Table 2.—France: Exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite	19,976	17,437	Sweden 6,141; Switzerland 5,974.
Oxide and hydroxide	353,919	326,438	Netherlands 135,703; Spain 47,439; Italy 35,730.
Metal including alloys:			
Scrap	32,094	33,967	Italy 15,247; West Germany 12,263; Belgium-Luxembourg 4,227.
Unwrought	165,792	166,418	Belgium-Luxembourg 37,711; West Germany 35,509; Italy 35,120.
Semimanufactures	191,045	217,291	West Germany 54,477; Belgium-Luxembourg 16,083; Italy 13,055.
Antimony:			
Ore and concentrate	1	7	NA.
Metal including alloys, all forms	219	392	Netherlands 181; Italy 43; Belgium-Luxembourg 40.
Arsenic:			
Anhydride and acid	7,231	--	
Metal including alloys, all forms	378	146	NA.
Beryllium metal including alloys, all forms value, thousands	$4	$41	NA.
Bismuth metal including alloys, all forms	72	7	NA.
Cadmium metal including alloys, all forms	132	219	Belgium-Luxembourg 120; United States 63.
Chromium:			
Chromite	982	983	Italy 808.
Oxide and hydroxide	284	171	United Kingdom 41; Switzerland 37.
Metal including alloys, all forms	455	611	United States 266; West Germany 127; Sweden 70.
Cobalt:			
Oxide and hydroxide	209	192	West Germany 68; Italy 41; United Kingdom 30.
Metal including alloys, all forms	1,066	1,100	West Germany 251; United States 238; United Kingdom 126.
Columbium and tantalum:			
Ores and concentrates[2]	10	--	
Metals including alloys, all forms:			
Columbium value, thousands	$12	$14	NA.
Tantalum do	$656	$440	NA.
Copper:			
Ore and concentrate	2,309	([3])	NA.
Matte	1,390	504	Italy 198; Belgium-Luxembourg 185; West Germany 100.
Copper sulfate	10,111	11,245	West Germany 4,597; Netherlands 1,316; Italy 1,097.
Metal including alloys:			
Scrap	96,091	35,241	West Germany 24,664; Belgium-Luxembourg 3,666; Italy 2,174.
Unwrought:			
Blister and other unrefined	5,076	3,665	Belgium-Luxembourg 3,224; West Germany 347.
Refined	12,486	21,249	Italy 7,655; Belgium-Luxembourg 4,392; West Germany 3,865.
Masteralloys	150	342	West Germany 130; Italy 77; Spain 43.
Semimanufactures	107,804	117,679	West Germany 37,491; Netherlands 7,707; Belgium-Luxembourg 6,306.
Gold:			
Ash and sweepings kilograms	221	10,566	Spain 8,049; Switzerland 241.
Metal, unworked or partly worked:			
Of domestic origin thousand troy ounces	86	593	Netherlands 147; Spain 129; West Germany 12.
Temporary imports do	1,226	158	Netherlands 58; Algeria 51; Romania 12.
Iron and steel:			
Ore and concentrate thousand tons	12,122	11,371	Belgium-Luxembourg 9,849; West Germany 1,521.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS —Continued			
Iron and steel —Continued			
Metal:			
Scrap thousand tons	3,357	3,662	Italy 3,067; Spain 266; West Germany 168.
Pig iron, cast iron, spiegeleisen do	195	128	Belgium-Luxembourg 42; Italy 33; West Germany 14.
Sponge iron, powder and shot do	35	36	West Germany 17; Italy 7; Spain 2.
Ferroalloys do	460	501	United States 178; West Germany 104; Italy 86.
Steel, primary forms do	2,135	2,200	Italy 701; United States 562; Greece 166.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	2,158	2,327	West Germany 363; Belgium-Luxembourg 247; United States 234.
Universals, plates, sheets do	3,155	3,486	West Germany 624; United States 474; Italy 427.
Hoop and strip do	406	449	West Germany 143; Belgium-Luxembourg 89; Italy 50.
Rails and accessories do	261	231	Italy 64; Belgium-Luxembourg 28; United Kingdom 18.
Wire do	130	154	United States 39; West Germany 36; Belgium-Luxembourg 11.
Tubes, pipes, fittings do	1,272	1,366	U.S.S.R. 223; West Germany 112; Italy 58.
Castings and forgings, rough do	59	60	Belgium-Luxembourg 19; West Germany 18; United Kingdom 4.
Lead:			
Ore and concentrate	29	40	NA.
Oxides	14,213	13,769	Romania 2,002; Czechoslovakia 1,602; Egypt 994.
Metal including alloys:			
Scrap	39,380	32,661	Italy 19,992; West Germany 9,908; Belgium-Luxembourg 2,328.
Unwrought	37,262	53,425	Belgium-Luxembourg 16,623; West Germany 13,713; Switzerland 5,981.
Semimanufactures	1,708	1,957	Belgium-Luxembourg 298; Netherlands 286; Italy 181.
Magnesium metal including alloys:			
Scrap	1,126	639	Netherlands 132; United States 81; Belgium-Luxembourg 61.
Unwrought	3,734	5,110	West Germany 2,727; Belgium-Luxembourg 431; Netherlands 375.
Semimanufactures	70	117	West Germany 60; Denmark 22; Spain 5.
Manganese:			
Ore and concentrate	8,323	5,606	Italy 2,571; Niger 1,201; Spain 554; Netherlands 330.
Oxides	2,863	3,660	Upper Volta 1,131; Madagascar 691; Ivory Coast 689.
Metal	1,945	2,138	Italy 861; West Germany 332; United States 172.
Mercury 76-pound flasks	1,218	3,539	Belgium-Luxembourg 1,915; Netherlands 696; United States 638.
Molybdenum:			
Ore and concentrate	162	336	Italy 181; United Kingdom 67; Austria 58.
Oxide	245	34	Netherlands 23.
Metal including alloys, all forms	93	136	West Germany 37; Netherlands 34; Belgium-Luxembourg 15.
Nickel:			
Matte, speiss, similar materials	211	850	Finland 716; West Germany 116.
Oxide and hydroxide	810	521	United States 85; Spain 76; Belgium-Luxembourg 67.
Metal including alloys:			
Scrap	2,429	306	West Germany 139; United Kingdom 83; United States 35.
Unwrought	4,989	5,324	West Germany 2,975; Italy 338; Mexico 329.
Semimanufactures	7,293	6,838	West Germany 2,186; United States 631; Italy 145.
Platinum-group metals:			
Waste and sweepings kilograms	142	3,150	United Kingdom 2,564; Spain 336.
Metals including alloys, all forms thousand troy ounces	297	245	Spain 125; Netherlands 47; United Kingdom 10.
Selenium, elemental	3	3	NA.
Silver:			
Waste and sweepings thousand troy ounces	9,239	9,908	Sweden 6,977; Spain 1,157; Belgium-Luxembourg 881.
Metal including alloys do	29,573	14,860	United Kingdom 10,377; West Germany 2,030; Netherlands 2,008.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS —Continued			
Thorium: Thoria and other compounds	393	448	Hong Kong 295; Canada 48; United Kingdom 48.
Tin:			
Ore and concentrate	18	10	NA.
Oxides	33	--	
Metal including alloys:			
Scrap	753	717	Netherlands 472; United Kingdom 216; West Germany 29.
Unwrought	423	868	United Kingdom 340; Netherlands 330; Italy 128.
Semimanufactures	347	598	Netherlands 150; West Germany 79; Italy 52.
Titanium:			
Ore and concentrate	370	331	Algeria 216.
Oxide	13,484	13,336	West Germany 2,678; United States 1,903; Belgium-Luxembourg 976.
Metal including alloys, all forms	636	530	Italy 172; United Kingdom 149; United States 67.
Tungsten:			
Ore and concentrate	1,125	1,613	West Germany 730; United States 626; Netherlands 168.
Oxide	27	2	NA.
Metal including alloys, all forms	338	297	United States 88; West Germany 61; Belgium-Luxembourg 45.
Uranium metal including alloys, all forms	10,177	11,785	United States 5,818; U.S.S.R. 4,250; United Kingdom 658.
Zinc:			
Ore and concentrate	24,174	54,588	Italy 27,887; Belgium-Luxembourg 26,698.
Matte	2,246	2,178	West Germany 976; Belgium-Luxembourg 477; Netherlands 357.
Metal including alloys, all forms:			
Scrap	2,385	1,786	Belgium-Luxembourg 759; Italy 520; West Germany 365.
Blue powder	2,684	1,648	United States 972; Switzerland 200; West Germany 151.
Unwrought	42,882	56,230	United States 24,347; West Germany 9,407; Italy 4,035.
Semimanufactures	30,536	42,515	Belgium-Luxembourg 19,001; West Germany 14,898; Denmark 3,013.
Zirconium:			
Ore and concentrate	1,086	742	Italy 641.
Oxide[4]	266	--	
Metal including alloys, all forms	398	584	United States 351; West Germany 90; Sweden 64.
Other:			
Ores and concentrates	21	107	NA.
Ash and residue containing nonferrous metals:			
Aluminum	10,146	9,227	Italy 6,585; West Germany 2,141.
Copper	17,988	20,292	Sweden 11,018; Spain 3,010; Belgium-Luxembourg 2,951.
Lead	5,046	3,807	Belgium-Luxembourg 1,856; West Germany 1,278.
Nickel	1,032	1,313	West Germany 410; Italy 369; Netherlands 365.
Zinc	20,429	46,795	Belgium-Luxembourg 34,402; Sweden 8,079; West Germany 2,504.
Unspecified	16,572	7,404	West Germany 2,472; Belgium-Luxembourg 1,525; Italy 1,100.
Oxides, hydroxides, peroxides of metals	3,473	4,771	United States 2,145; West Germany 1,275; East Germany 401.
Metals including alloys, all forms	478	554	Yugoslavia 165; West Germany 146; Belgium-Luxembourg 75.
NONMETALS			
Abrasives:			
Pumice, emery, natural corundum, etc	1,667	1,092	West Germany 480.
Dust and powder of precious and semiprecious stones value, thousands	$574	$737	Switzerland $439; Belgium-Luxembourg $175; United States $70.
Grinding and polishing wheels and stones	4,243	4,326	West Germany 930; Romania 475; Belgium-Luxembourg 352.
Asbestos	1,647	532	Tunisia 242.
Barite and witherite	99,353	116,535	West Germany 73,165; Netherlands 21,651; United States 6,600.
Boron materials:			
Crude natural borates	2,323	2,943	Belgium-Luxembourg 2,403.
Oxide and acid	29,548	30,057	West Germany 9,810; United Kingdom 5,442; East Germany 4,210.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Cement thousand tons	2,464	3,365	Ivory Coast 582; Cameroon 310; Venezuela 309.
Chalk	483,529	493,467	West Germany 197,024; Belgium-Luxembourg 93,363; Netherlands 51,381.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite	10,073	10,371	Nigeria 3,274; Cameroon 1,020; Congo 499.
Kaolin, including calcined	120,996	121,325	West Germany 61,462; Italy 25,542; Switzerland 8,430.
Kyanite and sillimanite	5,881	2,090	West Germany 1,788.
Other	520,486	499,846	Italy 250,337; West Germany 121,179; Belgium-Luxembourg 24,004.
Products:			
Refractory (including nonclay brick)	131,356	150,794	West Germany 38,467; Belgium-Luxembourg 11,737; Italy 11,024.
Nonrefractory	322,304	272,109	West Germany 148,403; Belgium-Luxembourg 96,098; Switzerland 18,252.
Cryolite and chiolite	2	41	NA.
Diamond:			
Gem, not set or strung value, thousands	$19,922	$29,235	Switzerland $13,214; Belgium-Luxembourg $5,774; Netherlands $4,850.
Industrial do	$410	$1,193	Ireland $521; Belgium-Luxembourg $388; United States $82.
Diatomite and other infusorial earth	19,363	24,982	West Germany 8,755; Belgium-Luxembourg 4,771; Italy 1,684. Italy 1,684.
Feldspar	43,640	52,453	Belgium-Luxembourg 27,624; Spain 11,132; West Germany 6,545.
Fertilizer materials:			
Crude:			
Nitrogenous	101	1	NA.
Phosphatic	10,085	16,503	United Kingdom 10,489; Italy 2,316; Belgium-Luxembourg 1,859.
Potassic	12,420	11,533	Belgium-Luxembourg 10,126.
Other	24,712	23,452	Switzerland 13,701; Belgium-Luxembourg 3,761; Spain 2,479.
Manufactured:			
Nitrogenous thousand tons	428	570	Belgium-Luxembourg 125; China, mainland, 113; West Germany 88.
Phosphatic:			
Basic slag do	188	161	Switzerland 91; Austria 35; Italy 31.
Other do	29	21	Spain 5; Czechoslovakia 3; United Kingdom 3.
Potassic do	634	523	Belgium-Luxembourg 152; West Germany 83; Italy 76.
Ammonia do	141	72	West Germany 39; Spain 12; Greece 6.
Fluorspar	93,343	95,284	West Germany 63,258; Sweden 7,100; Belgium-Luxembourg 6,555.
Graphite	662	1,051	West Germany 486; U.S.S.R. 143; Spain 112.
Gypsum and plasters thousand tons	1,112	1,009	Belgium-Luxembourg 478; West Germany 176; Netherlands 130.
Iodine	31	97	United Kingdom 51; West Germany 17.
Lime	272,603	271,083	Belgium-Luxembourg 146,633; West Germany 91,792.
Magnesite	551	8,185	U.S.S.R. 1,500; Italy 1,160; West Germany 1,047.
Mica:			
Crude, including splittings and waste	2,940	3,120	United Kingdom 962; West Germany 541; Belgium-Luxembourg 388.
Worked, including agglomerated splittings	482	896	Switzerland 390; West Germany 175; Italy 86.
Pigments, mineral:			
Natural, crude	3,183	--	
Iron oxides, processed	4,484	9,521	Italy 1,109; Netherlands 1,073; United States 1,029.
Precious and semiprecious stones, except diamond value, thousands	$27,996	$30,903	Switzerland $22,720; United States $1,470; United Kingdom $894.
Pyrite, gross weight	33	87	NA.
Salt and brines	197,195	167,728	West Germany 129,200; Belgium-Luxembourg 26,578.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	46,068	52,564	Tunisia 5,894; West Germany 3,653; Republic of South Africa 3,134.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Sodium and potassium compounds, n.e.s. —Continued			
Caustic potash and sodic and potassic peroxides	14,844	5,348	United Kingdom 1,218; Republic of South Africa 1,163; Brazil 425.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	19,852	17,996	Switzerland 4,240; West Germany 4,143; Italy 3,005.
Slate	43,510	51,926	Netherlands 29,154; West Germany 10,557; Belgium-Luxembourg 7,989.
Other	75,620	58,808	Belgium-Luxembourg 42,998; West Germany 4,652; Switzerland 4,174.
Worked:			
Slate	4,987	5,105	Belgium-Luxembourg 2,167; West Germany 1,764; Netherlands 624.
Paving stone and flagstone	5,348	7,443	Belgium-Luxembourg 5,238; West Germany 1,031; Switzerland 827.
Other	26,289	30,938	Belgium-Luxembourg 12,362; West Germany 9,166; Saudi Arabia 1,556.
Dolomite, chiefly refractory grade	36,644	51,755	Belgium-Luxembourg 12,398; West Germany 11,838; Ivory Coast 5,449.
Gravel and crushed rock thousand tons	11,059	10,624	West Germany 7,909; Switzerland 1,079; Belgium-Luxembourg 824.
Limestone, except dimension	103,498	157,068	West Germany 126,798; Belgium-Luxembourg 27,775.
Quartz and quartzite	5,818	2,308	West Germany 296; United Kingdom 209.
Sand, excluding metal bearing thousand tons	4,007	4,342	West Germany 2,508; Switzerland 792; Italy 748.
Sulfur:			
Elemental, all forms do	948	1,159	United Kingdom 312; Netherlands 168; Italy 116.
Sulfur dioxide	1,754	--	
Sulfuric acid	134,110	139,057	Belgium-Luxembourg 65,071; Spain 36,249; West Germany 20,583.
Talc, steatite, soapstone, pyrophyllite	73,578	77,310	West Germany 24,323; United Kingdom 11,300; Spain 9,788.
Other:			
Crude:			
Meerschaum, amber, jet	1	--	
Other thousand tons	710	1,255	Belgium-Luxembourg 1,051; Switzerland 191.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture do	1,854	2,383	Belgium-Luxembourg 1,069; West Germany 872; Italy 359.
Slag and ash, n.e.s	192,099	253,859	West Germany 239,949; Switzerland 7,999.
Oxides and hydroxides of magnesium, strontium, barium	13,570	4,978	United States 3,209; West Germany 790.
Fluorine	22	1	NA.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	130,168	126,366	West Germany 22,597; Belgium-Luxembourg 16,989.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	60,032	10,379	United Kingdom 5,850; Spain 161.
Carbon black and gas carbon:			
Carbon black	52,308	56,246	West Germany 15,912; Italy 12,687; Spain 10,555.
Gas carbon	39	--	
Coal, including briquets:			
Anthracite and bituminous coal	586,847	531,749	Belgium-Luxembourg 110,950; United Kingdom 33,270; Italy 19,794.
Briquets of anthracite and bituminous coal	45,034	27,786	United Kingdom 24,919; Switzerland 1,862.
Lignite and lignite briquets	12,781	6,370	All to Spain.
Coke and semicoke thousand tons	838	766	Canada 179; Belgium-Luxembourg 155; Italy 73.
Gas, natural thousand cubic feet	6,273	6,250	Switzerland 3,207; Belgium-Luxembourg 2,921.
Hydrogen, helium, rare gases	1,049	3,469	Italy 2,437; Belgium-Luxembourg 339; Switzerland 102.
Peat, including peat briquets	2,216	2,075	Switzerland 1,013; United Arab Emirates 432.
Petroleum:			
Crude thousand 42-gallon barrels	1,512	194	Mainly to West Germany.

See footnotes at end of table.

Commodity	1977	1978	Principal destinations, 1978
MINERAL FUELS AND RELATED MATERIALS —Continued			
Petroleum —Continued			
Refinery products:			
Gasoline[5] thousand 42-gallon barrels	21,650	21,970	Netherlands 6,045; West Germany 5,773; Switzerland 4,077.
Kerosine do	6,037	7,545	Switzerland 2,551; Denmark 1,084; Greece 472.
Distillate fuel oil do	30,592	35,430	West Germany 14,114; Switzerland 12,383; Italy 1,171.
Residual fuel oil do	35,306	26,557	Switzerland 5,125; United States 5,111; Italy 4,529.
Lubricants do	4,041	4,337	Belgium-Luxembourg 832; West Germany 585; United Kingdom 566.
Mineral jelly and wax do	395	738	United Kingdom 410; West Germany 152; Netherlands 49.
Liquefied petroleum gas do	8,459	6,256	Spain 3,208; West Germany 956; Morocco 706.
Other[6] do	2,740	3,219	West Germany 1,148; Switzerland 893; Belgium-Luxembourg 416.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	227,201	194,478	West Germany 116,776; Netherlands 29,658; United Kingdom 20,019.

NA Not available.
[1]Values are based on exchange rates of 4.9134 francs per U.S. dollar in 1977 and 4.5128 francs per U.S. dollar in 1978.
[2]Includes vanadium.
[3]Value only reported at $6,000, compared with $503,000 in 1977.
[4]Includes oxides of germanium.
[5]Includes motor and aviation gasoline, other light oils for similar uses, and white spirit.
[6]Includes pitch, pitch coke, petroleum coke, bitumen and other residues, and bituminous mixtures.

Table 3.—France: Imports of mineral commodities [1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite thousand tons	1,920	1,955	Guinea 1,764; Greece 91; Guyana 55.
Oxide and hydroxide	35,695	60,733	West Germany 26,472; Guinea 15,962; Netherlands 6,315.
Metal including alloys:			
Scrap	37,081	42,289	West Germany 15,346; Belgium-Luxembourg 11,788; Netherlands 8,295.
Unwrought	275,266	290,827	Netherlands 69,064; West Germany 63,675; U.S.S.R. 29,723.
Semimanufactures	147,970	153,503	West Germany 58,976; Belgium-Luxembourg 40,893; Italy 12,732.
Antimony:			
Ore and concentrate	7,679	9,984	Bolivia 3,907; Thailand 2,613; Australia 1,238.
Metal including alloys, all forms	451	818	China, mainland, 601; Spain 129.
Arsenic metal including alloys, all forms	89	60	United States 30; Sweden 19.
Beryllium metal including alloys, all forms value, thousands	$761	$757	Mainly from United States.
Bismuth metal including alloys, all forms	644	346	Bolivia 132; Belgium-Luxembourg 55; United Kingdom 42.
Cadmium metal including alloys, all forms	625	609	Belgium-Luxembourg 185; Mexico 98; Netherlands 97.
Chromium:			
Chromite	281,006	242,480	Madagascar 77,511; Republic of South Africa 57,022; Turkey 41,554.
Oxide and hydroxide	5,579	5,241	West Germany 2,356; Italy 1,263; United Kingdom 930.
Metal including alloys, all forms	56	64	Japan 35; United Kingdom 19.
Cobalt:			
Intermediate metallurgical products	8,678	9,727	Mainly from Morocco.
Oxide and hydroxide	169	293	Belgium-Luxembourg 258; United States 20.
Metal including alloys, all forms	660	994	Belgium-Luxembourg 469; Zaire 179; United Kingdom 75.
Columbium and tantalum:			
Ores and concentrates[2]	11	([3])	NA.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities [1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Columbium and tantalum —Continued			
Metals including alloys, all forms:			
Columbium ___ value, thousands__	$65	$295	NA.
Tantalum	18	30	United States 14; West Germany 7.
Copper:			
Ore and concentrate	1,008	1	NA.
Matte	544	522	West Germany 464; United Kingdom 58.
Copper sulfate	2,527	2,540	Italy 778; U.S.S.R. 548; Belgium-Luxembourg 462.
Metal including alloys:			
Scrap	15,450	3,941	West Germany 901; Belgium-Luxembourg 684; United Kingdom 414.
Unwrought:			
Blister and other unrefined	33,733	22,734	Zaire 10,321; Republic of South Africa 5,390; Belgium-Luxembourg 2,803.
Refined	309,186	282,691	Belgium-Luxembourg 103,069; Zambia 56,024; Chile 28,082.
Masteralloys	430	789	Belgium-Luxembourg 118; West Germany 79; Spain 58.
Semimanufactures	204,481	213,502	Belgium-Luxembourg 125,048; West Germany 34,545; Italy 22,032.
Germanium metal including alloys, all forms value, thousands__	$557	$795	Belgium-Luxembourg $346; United States $257.
Gold:			
Ash and sweepings ___ kilograms__	6,958	9,074	Switzerland 335; United Kingdom 163; Spain 67.
Metal, unworked or partly worked:			
For domestic use thousand troy ounces__	1,271	1,666	West Germany 1,428; Netherlands 180.
Temporary imports ___do___	1,219	629	Republic of South Africa 372; Switzerland 126; Netherlands 81.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons__	15,432	14,604	Brazil 4,301; Australia 2,197; Mauritania 2,140.
Roasted pyrite	78,187	92,272	Italy 63,639; West Germany 15,275; Spain 13,334.
Metal:			
Scrap	287,030	393,803	Belgium-Luxembourg 178,370; West Germany 91,612.
Pig iron, cast iron, spiegeleisen[4] thousand tons__	460	407	West Germany 366; Canada 19.
Sponge iron, powder, shot	28,306	19,335	Sweden 11,081; West Germany 2,663; Spain 2,571.
Ferroalloys ___ thousand tons__	190	179	New Caledonia 54; Republic of South Africa 17; Belgium-Luxembourg 16.
Steel, primary forms ___do___	1,886	2,272	Belgium-Luxembourg 1,211; West Germany 649; Italy 127.
Semimanufactures:			
Bars, rods, angles, shapes, sections do___	2,097	1,871	Italy 368; West Germany 290; Belgium-Luxembourg 273.
Universals, plates, sheets do___	2,616	2,575	Belgium-Luxembourg 1,198; West Germany 636; Italy 195.
Hoop and strip ___do___	320	322	Belgium-Luxembourg 160; West Germany 112; Italy 9.
Rails and accessories	23,066	36,360	Belgium-Luxembourg 20,785; United Kingdom 12,919.
Wire ___ thousand tons__	102	117	Belgium-Luxembourg 46; West Germany 34; Italy 16.
Tubes, pipes, fittings ___do___	458	487	Italy 147; West Germany 143; Spain 57.
Castings and forgings, rough	43,022	43,191	West Germany 21,299; Italy 8,454; Belgium-Luxembourg 4,326.
Lead:			
Ore and concentrate	125,561	134,738	Australia 33,891; Morocco 29,858; Ireland 29,732.
Oxides	1,409	841	Belgium-Luxembourg 491; West Germany 166.
Metal including alloys:			
Scrap	11,262	17,246	Belgium-Luxembourg 12,418; Netherlands 2,509; United Kingdom 881.
Unwrought	47,631	38,238	West Germany 13,375; Belgium-Luxembourg 12,787; United Kingdom 9,747.
Semimanufactures	709	1,234	West Germany 512; Belgium-Luxembourg 318.
Magnesium metal including alloys:			
Scrap	158	257	Italy 154.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities [1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Magnesium metal including alloys —Continued			
Unwrought	3,043	3,149	Norway 1,933; U.S.S.R. 440; United States 390.
Semimanufactures	130	357	Italy 166; West Germany 129.
Manganese:			
Ore and concentrate ___ thousand tons	923	958	Republic of South Africa 395; Gabon 334; Brazil 131.
Oxides	7,074	5,541	Spain 1,840; West Germany 1,177; Belgium-Luxembourg 1,160.
Metal	1,121	1,030	Republic of South Africa 561; Japan 204; Netherlands 172.
Mercury ___ 76-pound flasks	6,150	5,279	Italy 2,205; Spain 2,002; Algeria 754.
Molybdenum:			
Ore and concentrate	7,314	6,963	United States 2,822; Canada 2,167; Netherlands 779.
Oxide	55	359	West Germany 205; Netherlands 67; Sweden 57.
Metal including alloys, all forms	185	164	United States 61; Austria 53; Netherlands 15.
Nickel:			
Ore and concentrate	966	100	NA.
Matte, speiss, similar materials	20,427	12,986	New Caledonia 10,230; Canada 1,000; Australia 823.
Oxide and hydroxide	177	226	Canada 154; Cuba 61.
Metal including alloys:			
Scrap	1,340	74	Spain 40.
Unwrought	12,137	12,177	Republic of South Africa 3,850; United Kingdom 2,113; Canada 1,441.
Semimanufactures	6,720	5,560	United Kingdom 1,966; West Germany 1,369; United States 1,049.
Platinum-group metals:			
Waste and sweepings ___ kilograms	3,198	2,578	Netherlands 581; Spain 413; West Germany 272.
Metals including alloys, all forms troy ounces	422,139	358,512	United Kingdom 134,872; Switzerland 52,599; U.S.S.R. 38,677.
Selenium, elemental	50	53	Japan 23; United Kingdom 10; Belgium-Luxembourg 8.
Silver:			
Waste and sweepings ___ kilograms	48,779	192,624	United Kingdom 115,391; Switzerland 18,431; United States 14,470.
Metal including alloys thousand troy ounces	49,703	43,498	United Kingdom 16,495; India 7,424; Belgium-Luxembourg 3,437.
Thorium, ore and concentrate	6,531	9,053	Australia 6,811; United States 2,115; Zaire 65.
Tin:			
Oxides	220	--	
Metal including alloys:			
Scrap	268	136	Italy 96; Switzerland 25; Belgium-Luxembourg 10.
Unwrought	10,509	10,828	Malaysia 3,434; Indonesia 2,090; Thailand 1,784.
Semimanufactures	412	388	Italy 145; West Germany 76; Netherlands 45.
Titanium:			
Ore and concentrate	144,127	154,477	Australia 152,990.
Oxides	23,512	27,190	West Germany 8,780; Belgium-Luxembourg 5,661; Netherlands 4,112.
Metal including alloys, all forms	1,025	965	United Kingdom 279; United States 227; Japan 161.
Tungsten:			
Ore and concentrate	2,034	2,468	Thailand 569; China, mainland, 329; Canada 285.
Oxide	53	34	Mainly from West Germany.
Metal including alloys, all forms	173	251	West Germany 22; Netherlands 18; Denmark 17.
Uranium:			
Ore and concentrate	3,436	3,131	Gabon 1,426; Niger 1,294.
Metal including alloys, all forms	5,686	5,394	Republic of South Africa 2,016; U.S.S.R. 1,015; Belgium-Luxembourg 623.
Zinc:			
Ore and concentrate	466,580	454,582	Canada 113,364; Peru 105,783; Ireland 72,615.
Oxide	4,229	5,062	West Germany 1,519; Belgium-Luxembourg 1,118; Italy 923.
Metal including alloys, all forms:			
Scrap	7,997	8,028	Netherlands 2,750; Belgium-Luxembourg 2,022; West Germany 1,121.
Blue powder	2,597	3,456	Belgium-Luxembourg 2,687; Netherlands 367; Spain 192.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Zinc —Continued			
Metal including alloys, all forms —Continued			
Unwrought	86,135	99,732	Belgium-Luxembourg 49,387; Netherlands 16,592; West Germany 7,774.
Semimanufactures	4,902	5,526	West Germany 3,274; Belgium-Luxembourg 944; Poland 523.
Zirconium:			
Ore and concentrate	31,549	38,787	Australia 36,044; West Germany 1,521.
Oxide[4]	714	719	United States 386; United Kingdom 269.
Metal including alloys, all forms	149	496	United States 392; United Kingdom 41.
Other:			
Ores and concentrates	3,543	1,662	NA.
Ash and residue containing nonferrous metals:			
Aluminum	5,396	7,138	Italy 3,039; Netherlands 1,515; West Germany 1,485.
Copper	1,079	1,072	Japan 690.
Lead	13,074	9,712	Italy 7,927; Belgium-Luxembourg 1,283.
Nickel	44	40	NA.
Zinc	15,690	22,750	Belgium-Luxembourg 10,521; West Germany 6,605; Netherlands 2,447.
Other	11,303	15,182	Italy 13,682; Switzerland 992.
Oxides, hydroxides, peroxides of metals	2,065	2,739	West Germany 709; Finland 478; Belgium-Luxembourg 395.
Metals including alloys, all forms	327	466	U.S.S.R. 101; Austria 21; West Germany 20.
NONMETALS			
Abrasives:			
Pumice, emery, natural corundum, etc	40,568	38,097	Turkey 26,098; West Germany 4,001; Italy 1,803.
Dust and powder of precious and semiprecious stones value, thousands	$10,757	$10,862	United States $5,579; Republic of South Africa $2,792; Switzerland $835.
Grinding and polishing wheels and stones	7,469	7,231	Italy 1,913; West Germany 1,603; Belgium-Luxembourg 1,417.
Asbestos	114,790	110,812	Canada 43,185; U.S.S.R. 38,028; Netherlands 8,455.
Barite and witherite	11,814	8,983	West Germany 8,226.
Boron materials:			
Crude natural borates	171,178	181,070	Turkey 115,881; United States 62,365.
Oxide and acid	1,087	8,878	United States 3,666; West Germany 2,577.
Bromine	1,970	2,762	Israel 2,079; United Kingdom 607.
Cement	152,028	313,725	Belgium-Luxembourg 265,795; Italy 17,454.
Chalk	23,868	35,689	West Germany 29,577; Belgium-Luxembourg 6,011.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite	90,482	87,235	Italy 30,395; Greece 27,991; West Germany 11,943.
Kaolin, including calcined	322,324	306,755	United Kingdom 228,663; United States 25,141.
Kyanite and sillimanite	4,850	6,196	India 2,705; United States 1,751; United Kingdom 904.
Other	226,859	200,398	West Germany 146,814; United Kingdom 24,036; United States 15,900.
Products:			
Refractory (including nonclay brick)	149,811	130,947	West Germany 51,888; Austria 28,721; Belgium-Luxembourg 22,302.
Nonrefractory thousand tons	730	114	Italy 36; West Germany 21; Spain 19.
Cryolite and chiolite	1,080	792	Denmark 744.
Diamond:			
Gem, not set or strung value, thousands	$161,634	$275,192	Belgium-Luxembourg $113,735; Switzerland $57,855; Israel $37,894.
Industrial do	$5,465	$7,210	Belgium-Luxembourg $2,147; Ireland $2,069; Central African Empire $770.
Diatomite and other infusorial earth	5,254	8,878	United States 3,666; West Germany 2,577; Algeria 996.
Feldspar	17,323	17,024	West Germany 11,195; Spain 4,819.
Fertilizer materials:			
Crude:			
Nitrogenous	6,575	9,220	All from Chile.
Phosphatic thousand tons	4,736	4,966	Morocco 2,054; United States 1,048; Tunisia 361.
Other	35,983	23,098	Netherlands 11,382; Italy 4,391; Belgium-Luxembourg 2,906.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities [1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
NONMETALS —Continued			
Fertilizer materials —Continued			
Manufactured:			
Nitrogenous thousand tons	937	1,105	Belgium-Luxembourg 464; Netherlands 341; West Germany 62.
Phosphatic:			
Basic slag do	330	498	Belgium-Luxembourg 488; West Germany 10.
Other do	526	600	United States 160; Tunisia 124; Netherlands 86.
Potassic do	405	322	Belgium-Luxembourg 135; Israel 56; U.S.S.R. 44.
Ammonia do	254	284	Belgium-Luxembourg 84; Netherlands 55; West Germany 43.
Fluorspar	14,845	1,796	United Kingdom 769.
Graphite, natural	5,727	6,781	Italy 1,726; Madagascar 1,425; West Germany 1,137.
Gypsum and plasters thousand tons	14,011	16,900	Spain 8,606; West Germany 5,215.
Iodine	745	998	Japan 665; Chile 298.
Lime	98,964	86,870	West Germany 42,011; Belgium-Luxembourg 40,259.
Magnesite	80,903	92,239	Greece 29,356; Spain 10,332; Italy 7,654.
Mica:			
Crude, including splittings and waste	3,614	10,164	India 7,424; Brazil 1,355; United States 386.
Worked, including agglomerated splittings	160	224	Belgium-Luxembourg 79; Switzerland 76; West Germany 27.
Pigments, mineral:			
Natural, crude	1,169	--	
Iron oxides, processed	28,969	28,867	West Germany 21,337; Belgium-Luxembourg 5,740.
Precious and semiprecious stones, except diamond value, thousands	$58,690	$99,671	Switzerland $58,885; India $10,950; Thailand $6,978.
Pyrite, gross weight	691	617	Italy 466; West Germany 117.
Salt and brines	156,397	162,782	Belgium-Luxembourg 95,262; Netherlands 36,185; West Germany 19,036.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	106,412	136,476	Belgium-Luxembourg 49,238; West Germany 43,124; Italy 23,012.
Caustic potash and sodic and potassic peroxides	474	899	Yugoslavia 325; West Germany 230.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	68,957	87,136	Italy 38,662; West Germany 38,318; Portugal 5,057.
Slate	8,185	6,319	United Kingdom 2,749; Spain 1,776; Italy 1,596.
Other	175,725	161,535	Republic of South Africa 58,155; Norway 35,103; Finland 21,122.
Worked:			
Slate	117,626	127,175	Spain 124,209; Italy 1,509.
Paving stone and flagstone	53,290	33,014	West Germany 19,015; Italy 12,587.
Other	104,913	104,796	Italy 91,588; West Germany 3,006; Belgium-Luxembourg 1,367.
Dolomite, chiefly refractory grade	345,567	296,808	Belgium-Luxembourg 181,607; West Germany 94,187.
Gravel and crushed rock thousand tons	5,713	4,697	Belgium-Luxembourg 3,490; United Kingdom 827; Norway 123.
Limestone, except dimension	224,330	188,303	Belgium-Luxembourg 186,864.
Quartz and quartzite	14,647	13,941	Italy 8,208; Portugal 2,492; West Germany 1,139.
Sand, excluding metal bearing thousand tons	1,441	1,231	Belgium-Luxembourg 712; United Kingdom 344; Netherlands 151.
Sulfur:			
Elemental, all forms	662,222	663,716	Poland 446,868; United States 89,066; Canada 88,237.
Sulfur dioxide	735	--	
Sulfuric acid	179,608	200,272	Belgium-Luxembourg 102,724; West Germany 91,419.
Talc, steatite, soapstone, pyrophyllite	12,147	17,258	Italy 10,886; Belgium-Luxembourg 2,341; Norway 1,402.
Other:			
Crude thousand tons	897	978	Switzerland 597; Spain 185; West Germany 85.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities [1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
NONMETALS —Continued			
Other —Continued			
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture thousand tons	1,051	834	Belgium-Luxembourg 509; West Germany 196; Canada 83.
Slag and ash, n.e.s	89,945	68,444	West Germany 59,065; Netherlands 2,223.
Oxides and hydroxides of magnesium, strontium, barium	3,488	1,416	West Germany 649; Ireland 152; Japan 108.
Bromine and fluorine	1,974	2,767	Israel 2,079; United Kingdom 607.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	135,503	149,551	Italy 50,119; Belgium-Luxembourg 39,830; West Germany 25,270.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	2,202	2,246	United States 1,421.
Carbon black and gas carbon:			
Carbon black	78,073	76,566	Netherlands 35,014; West Germany 23,620; Italy 8,220.
Gas carbon	21	--	
Coal, including briquets:			
Anthracite and bituminous coal thousand tons	21,522	23,783	Republic of South Africa 6,921; West Germany 6,446; Poland 4,882.
Briquets of anthracite and bituminous coal do	74	268	West Germany 239; Belgium-Luxembourg 22.
Lignite and lignite briquets do	169	175	West Germany 174.
Coke and semicoke do	2,189	1,696	West Germany 1,462; Netherlands 112; Belgium-Luxembourg 94.
Gas, natural million cubic feet	524	544	Netherlands 410; Algeria 82; Norway 52.
Hydrogen and rare gases	27,032	35,200	Belgium-Luxembourg 25,451; West Germany 4,147; Netherlands 2,595.
Peat, including peat briquets thousand tons	103	116	West Germany 64; U.S.S.R. 31; Netherlands 16.
Petroleum:			
Crude thousand 42-gallon barrels	874,875	1,321,015	Cameroon 460; Saudi Arabia 292; Iraq 150.
Refinery products:			
Gasoline[5] do	20,956	19,727	West Germany 5,245; Italy 4,293; U.S.S.R. 2,171.
Kerosine do	487	329	Italy 267; West Germany 12; Belgium-Luxembourg 7.

[1]Values are based on exchange rates of 4.9134 francs per U.S. dollar in 1977 and 4.5128 francs per U.S. dollar in 1978.
[2]Includes vanadium.
[3]Less than 1/2 unit.
[4]Includes oxides of germanium.
[5]Includes motor and aviation gasoline, other light oils for similar uses, and white spirit.
[6]Includes pitch, pitch coke, petroleum coke, bitumen and other residues, and bituminous mixtures.

COMMODITY REVIEW

METALS

Aluminum.—During 1978 and 1979, production of bauxite in France was down because of declining reserves. By far the largest producer remained Aluminium Pechiney; its output accounted for about 70% of the total French bauxite output.

Three alumina plants, all owned by Pechiney-Ugine-Kuhlmann (PUK), were in operation in France. Total capacity was 1.3 million tons per year. The largest plant, at

Cardane (Bouches-du-Rhône), had a capacity of 750,000 tons per year.

During 1979, Aluminium Pechiney announced plans to increase its aluminum smelting capacity in France by 82,000 tons, to reach a total of 489,000 tons by 1983, at an estimated cost of $94 million. The largest increase was planned for the St. Jean de Maurienne installation, which will reach a capacity of 120,000 tons, or 55% more than the present.

Ten aluminum smelters were operational in 1978-79, all owned by PUK. The largest, located at Noguéres, had a capacity of 115,000 tons of aluminum per year. France was a net importer of bauxite and aluminum and a net exporter of alumina.

Packaging consumed 27% of total aluminum consumption in France; building construction followed with 18%.

Antimony.—BRGM accelerated exploration of antimony deposits at Quimper and d'Ouche (Cantal) during 1978 and 1979. Reserves at both deposits are small, and a large production was not to be expected.

There was no mine production of antimony, but the Société Nouvelle des Mines de la Lucette operated a smelter and a plant for production of antimony chemicals from Moroccan concentrates at Le Genest (Mayenne).

Copper.—Two copper deposits were being examined during 1978 and 1979 by the BRGM: At Porte-aux-Moins (Cote du Nord) and Bodennec (Finistére), which are faulted. Most French deposits, including these, are furthermore small and low grade (0.5% to 2.0% copper); lead and zinc are also usually present, and the separation of the metals presents a technical problem. Porte-aux-Moins and Bodennec are about 30 miles apart, and a single concentrator was being considered for the two of them.

France was completely dependent on imported raw materials and scrap for its largest copper smelter, the 45,000-ton-per-year plant at Palais, Haute Vienne, and two smaller ones with annual production of few hundred tons. France was also a net importer of copper metal. Annual consumption amounted to about 330,000 tons, of which about 57% was used by the electrical industry, 22% by the appliance industry, and 12% by the construction industry.

During 1979, additional finance was obtained for the copper plan initiated in 1972; during 7 years of its existence the plan had proved its effectiveness. Its aim was to develop new copper resources in French territory; to promote cooperation between France and developing mining countries; and to encourage greater use of copper scrap.

Gold.—Exploration for gold was conducted by the BRGM and Peñarroya in the region of Saint-Yrieix (Haute Vienne). Results were described as encouraging, but no details were made public.

The Salsigne mine (Aude), owned by Société des Mines et Produits Chimiques de Salsigne, produced gold from a complex ore also containing silver, copper, bismuth, and arsenic; matte was shipped abroad for recovery of the metals.

Iron and Steel.—The French Government's plan to save the steel industry and the related merger of Chiers-Chatillon with Usinor, the largest producer of steel in France (capacity 7.9 million tons per year), were the major events during the years of 1978 and 1979.

During 1978, the French iron and steel industry had a near disastrous year. All indicators were down, and the threat of bankruptcy became very real as losses of the industry became astronomic. After long, and sometimes heated, discussions, the French Assembly and Senate approved a steel plan that provided major financial relief for the largest French steel companies for 5 years; it also distributed the costs of recent losses and avoided the effects of bankruptcy on financial markets. Although the plan gave the Government direct and indirect majority control of the steel companies, it was described not as a nationalization but as a purely financial arrangement; restructuring of the companies and terms of employment remained the responsibility of the management. The Government stated its intention to eventually return control to the private sector; this, and repayment of the Government loans, will depend on how the individual firms restore profitability. The new steel plan will substantially alter the composition of shareholding in the steel companies affected.

At yearend 1978, proposals for restructuring the industry, still under discussion, included the following steps, among others, at Usinor: Concentration of steel and steel semimanufactured products in Dunkerque and closure by summer 1979 of the iron and steel furnaces at Denain; retention of the cold rolling facilities at Montataire, Mardyck, and Biache; closure of installations at Blagny but not the plant at d'Isbergues. The plant at Azin will be closed, and the rolling trains for long products at Longwy et de Neuve-Maisons will remain in operation. Construction of a steel plant at Neuves-Maisons will be completed. Facilities for continuous casting at Neuves-Maisons and at Thionville also will be completed. The Chiers-Longwy steel plant will be closed during 1979; the steel plant, operated by Usinor at Longwy, was slated to stop production at the end of 1980. All closures at Usinor will result in a loss of 12,000 jobs.

At Sacilor-Sollac, most of the efforts will be directed toward modernization. However, blast furnaces and the coking plant at Hagodange will be closed. Measures taken at Sacilor-Sollac would result in a loss of 8,500 jobs. At yearend, strong opposition to this plan was voiced by steelworkers who feared the possibility of losing eventually more than 20,000 jobs. Local authorities at Longwy, Denain, and Valencienne, communities hardest hit by the proposed plans, also expressed concern. Negotiations were underway to find solutions to help the steelworkers and the Lorraine economy.

In addition, on November 16, 1978, a merger was announced between Usinor and Chiers-Chatillon's fully owned subsidiary, La Societe Chatillon-Neuves-Maisons. After merging, streamlining of iron and steel facilities will be undertaken, and duplicate facilities and obsolete equipment should be eliminated.

During the early part of 1979, social unrest and strikes prevailed in steel-producing areas of France, and steelworkers also rioted in Paris. In July 1979, an agreement, apparently satisfactory to all, was signed guaranteeing social protection to workers of the steel industry affected by consolidation of the industry. According to the agreement, bonuses ranging between 10,000 and 50,000 francs were to be given to all those who voluntarily left the industry before July 1. Older workers were placed into two categories; those aged 55 to 65 were to be pensioned at 75% of their former salaries, and those aged 50 to 55, at 70%. the Government will cover most of these costs, and a small contribution will be made by professional organizations. Development of new industries and priority for employment of former steelworkers were also part of the contract.

Lead and Zinc.—Exploration of complex sulfide ores containing lead, zinc, copper, and some silver in the Massif Armoricain in Britanny continued. Results were mixed. At the Menex-Albot (Finistére), deposit results of the first exploratory drilling were reportedly encouraging. The Rouex (Sarthe), sulfide deposit of about 50 million tons, was reported to be too low grade to warrant exploitation. In addition, exploration for lead and zinc was carried out in Vosges where a discovery was recorded at Lusse. In the Pyrenees, reports indicated a discovery at Nerbiou (Hautes-Pyrénées). Both deposits require further exploration before any assessment of their value can be made.

Nickel.—Société Le Nickel SA (SLN) closed its nickel plant at Le Havre in July 1978 and replaced it with a new 16,000-ton-per-year nickel electrolytic plant at Sandouville which cost 250 million francs to build.

The Sandouville plant is located 15 kilometers from Le Havre between the Tancarville Channel and the Central Maritime Channel (Le Canal Central Maritime), on the grounds of an industrial park managed by Post Authority of Le Havre. There is a railroad connection and in the near future a connection with a nearby highway will be built. The new facility has an annual capacity of 16,000 tons of pure electrolytic nickel, with preliminary expected analysis as follows: Nickel, 99.7%; cobalt, less than 20 ppm; and iron, copper, and zinc, each less than 10 ppm. The raw material will be nickel matte (75% nickel) from New Caledonia.

In addition to nickel, the following byproducts will be produced: iron chloride (600 tons per year of contained iron); cobalt chloride (350 tons of contained cobalt); and sulfur (4,000 tons per year). Raw materials for nickel salt production will also be supplied to a plant operated by Selnic, a subsidiary of SLN. The plant will also be able to produce nickel oxide and powders. The hydrometallurgical process, developed in part in the SLN research center in Trappes, includes, (1) nickel matte treatment with chlorine, (2) extraction and purification of the liquid phase, (3) eletrolysis of nickel chloride, and (4) casting of cathodes. All effluents, solid, liquid, and gases, are controlled to eliminate possible pollution of the Seine basin. Employment is 265 persons.

The changeover from the Le Havre plant to the Sandouville plant and startup problems resulted in a significant drop in French nickel production in 1978, followed by a 6-month loss of production in 1979 due to a plant fire. Domestic annual consumption of nickel metal was around 33,200 tons.

The iron and steel industry used about 66.5% of the total. Semimanufactures, electroplating, and foundries used between 6% and 7% each; production of money and other medals, 3.1%; and catalysts, the electric industry, and the automobile industry used between 1% and 2% each.

Tungsten.—A pilot mine, operated by BRGM, started production at Montredon (Tarn), to test selective open pit methods. Reserves were reported at 1 million tons with an average content of 0.70% WO_3. Montredon is one of several tungsten deposits discovered in France by BRGM during the past several years.

In addition, during 1978 and in the beginning of 1979, two tungsten mines were in operation: the largest producer, the Salau Mine (Ariege), operated by Société Minière d'Anglade, and the smaller producer, Enguiales Mine (Aveyron), operated by Société Minière et Chimique du Chatelet. In March 1979 Enguiales Mine was closed because of financial problems. Leaching of concentrates was done at Gurugnon plant operated by CEA. Because of imminent closure of the plant at Gueugnon, leaching of tungsten concentrates was transferred to a plant at Séte, operated by Compagnie Française d'Azote. Although France was the largest producer of tungsten among the European Economic Community countries, imports of concentrates were necessary to meet the demand. France consumed about 1,700 tons of tungsten metal in 1978, of which 51% was used in steel production and 24%, in production of tungsten carbides.

NONMETALS

Barite.—France was an important producer and a net exporter of barite during 1978 and 1979. Production remained at the same order of magnitude as in 1977 and roughly half of the output was exported. Principal producers of barite were Société Barytine de Chaillac (Indre), Société de Mines de Carrot, and Société des Couleurs Zinciques. About 87% of the barite consumption of France was in drilling muds.

Cement.—Société des Ciments Francais, with 22 plants, and Ciments LaFarge France, with 18 plants, were the largest cement producers in France. Total national capacity was about 40 million tons of cement. Preliminary reports indicate that in 1979 the industry operated at about 65% of capacity. The French Government removed controls from cement prices during the year. After conversion of the Hauboürdin and the Teil plants during 1979, all Lafarge clinker production was produced by dry process units except in Limay and Séte. At Haubourdin, conversion was accomplished by changing a long wet unit to a semi-dry with filters to produce filter cake for Polysiús Lepol preheating grate. At the white cement plant at Teil, conversion was made to the dry process with preheater and precalciner. This conversion resulted in a caloric consumption of 3.5 million Btu per ton instead of 4.1 million Btu in Lafarge.

Talc.—The only mine producer of talc in France, Talc de Luzenac (Ariége), completed construction of an aerial tramway connecting its opencast mine at Trumouns (elevation 1,800 meters above the sea level) to its plant at Luzenac (elevation 600 meters) during 1978. Reportedly the capacity of 190 tons per hour, on a difference of elevation of more than 1,000 meters, made the installation one of the world's largest aerial tramways; annual capacity should be between 442,000 tons and 574,000 tons.

MINERAL FUELS

Coal.—During 1978 and 1979, according to preliminary data, French coal output declined as a result of lack of demand due to the general economic situation. The following tabulation shows production of coal in France by kinds and regions, December and 12-month cumulative for 1978, in metric tons.

Kind of coal	Regions	December 1978	January-December 1978
Coal:			
Bituminous and anthracite.	Nord-Pas-de-Calais.	499,355	5,974,191
	Lorraine	725,498	9,763,572
	Centre Midi	271,316	3,952,517
Total		1,496,169	19,690,280
Lignite	Centre Midi	119,065	1,564,721
	Region Landaise	145,000	1,167,105
Total		264,065	2,731,826
Grand total		1,760,234	22,422,106

NA Not available.

Source: Coal International, Zinder Neris Inc., Washington, N. Y. A monthly inventory of information, V. 1, No. 1, May 1978.

French Government projections indicated French demand would increase by tenfold by the year 2000; as one step to meet the expected demand, the BRGM, during the year, acquired about 50% of the Wambo Mining Co. of Australia.

In January 1978, the French Government and the State-owned coal monopoly, Charbonnages de France (CdF), reached agreement on a new contractual basis for their relationship. The contract, which had been under discussion since 1974, covered the 3-year period beginning January 1, 1978, and aimed at reestablishing the financial profitability of CdF. In spite of large State payments, CdF lost 200 million francs on its coal operations in 1977. In order to bring these operations back to equilibrium, the French Government was to take the following actions:

(1) Assume the expenses not allocable to normal operations. These expenses include special retirement charges, costs from closed mines, and costs involved in retaining employees affected by staff reductions.

(2) Assume servicing costs of debt incurred to finance past losses and costs of research previously undertaken for the French Government.

(3) Provide a subsidy of 14 francs per kilotherm produced, up to the annual planned production (for a total of 1,875 million francs in 1978). The amount of the subsidy per kilotherm will be increased annually by the same percentage as the industrial price index.

(4) Grant additional compensation for any new demands placed on CdF by the State.

In return for these financial aids, CdF is expected to break even in its operating budget. In order to achieve this, CdF will be freed of the price controls it has been laboring under, and which it blames for its losses. Prices at the mine for industrial coal were expected to increase 8% by May 1978 and an additional 8% in July (prices to the consumer were to rise by 12%). Prices, at the mine, for domestic coal are expected to increase 8% in May and 30% in July (for a 19% increase to the consumer).

The contract calls for CdF's annual capital budget to be set by the Fonds de Development Economique et Social (FDES). The 1978 budget earlier had called for 895.4 million francs to be invested in the following manner:

	Million FF
Development of current mines	161.0
Social investments (housing, etc.)	138.3
Coal-based industries (cokeries, electrical generating)	314.4
New coal mine projects	194.0
New industrial projects	62.3
Exploration	5.4
Foreign participation	5.0
Other	15.0

All CdF obligations issued for these purposes will be guaranteed by by French Government.

While the redefinition of CdF's relationship with the State will not result in a great resurgence of the French coal industry, the commercial freedom from which CdF will benefit should allow it to develop its currently profitable coal mines more quickly. This may provide some limited opportunities for U.S. mining equipment sales. Coal imports (including those from the United States), which provide approximately half of French coal consumption, are not expected to be significantly affected.

Natural Gas.—Gas de France, the principal gas distributor in France, commissioned Ateliers et Chantiers de Bretagne (ACB) to design and manufacture a liquefied natural gas (LNG) vaporization plant for the future methane terminal at Montoir de Bretagne. The capacity of the new installation was reported to be 1,200 cubic meters of LNG per hour. Furthermore, France continued to build 80,000 cubic meters of additional underground storage space for natural gas in the area near Fos, a seaport in southern France. At yearend 1979, Gas de France was suffering financial difficulties caused by increases in costs of equipment. France remained dependent on imports of natural gas to meet about 70% of its demand. The Netherlands was the principal supplier of imported natural gas; the Lacq Region in southern France produced about 97% of domestic natural gas.

Petroleum.—During 1978 and 1979, France remained almost completely dependent on imports of crude petroleum to meet its demand. Roughly about 99% of crude oil processed in French refineries was imported. However, about three-quarters of oil imports came from foreign fields that were partly or completely operated by French interests.

Exploration and Production.—Exploration in France was small by number of rigs in operation (14) and number of basins (2) where it was conducted, and results were mixed. The Aquitaine Basin and Paris Basin were the chief theaters of exploration.

In Aquitaine, on one permit, granted to Comminges (Elf Aquitaine 70% and Essorep 30%), the work on evaluation of the Lannemazan gas deposit continued, but results were inconclusive. Drilling at the Bonnefont 1 well encountered oil at the depth of 3,720 meters. During a 9-hour drill steam test about 5 cubic meters of 0.85 density oil were recovered. At the d'Armagnac permit (Elf Aquitaine 50% and Shell Francaise 50%), oil in small quantities was found in formations similar to those at Grenade. At the Bezordan structure, production had to be stopped because of large intrusions of water. Water breakthrough happened after production of 15 million cubic meters of gas. This gas was processed in the gas plant at Boussens.

In the Paris Basin, step-out drilling was underway at the Soudron structure, but results were not made public at yearend.

The Paris and Aquitaine Basins were the only two producing basins during 1978. Aquitaine accounted for about 80% of the total with fields at Parentis, Cazaux, Mothes, Lavergne, Lacq, Superieur, and others; Esso contributed approximately 68% of the total production.

During 1979, discoveries in the southwest of France, near Burosse and Vialer, were promising and after development could produce 1 million tons of crude per year. This would almost double present French domestic output.

Refining.—In September 1978, Elf suspended operations at the 1.5-million-ton-per-year oil refinery at Vern-sur-Seiche (Ille-et-Vilaine). During the year, French refineries operated at 69% of the installed capacity. At yearend 1979, there were 22 refineries in operation in France with an aggregate annual capacity of approximately 170 million tons; this was one refinery less and 1.5 million tons per year less capacity than in 1977.

Management of Esso SAF decided to increase capacity of the desulfurization installation from 3,700 tons per day to 6,900 tons per day at the refinery at Fos sur Mer. The contract, valued at 200 million francs, was awarded to Foster Wheeler. At Port-Jerome, another Esso SAF refinery, a decision was made to build a new dewaxing unit with a capacity of 367,000 tons of dewaxed lubricants. The French company, Technip, was chosen to be the contractor. Completion was scheduled for mid-1980's, but costs were not made public.

Uranium.—France continued development of its nuclear powerplants to assure a total capacity of 40,000 megawatts of electrical power, or 50% or total electric generating capacity, by 1985. France has the industrial capability to build standardized 900-megawatts of electrical power nuclear plants, mostly light-water reactors (LWR). At the beginning of 1978 through 1979, four LWR (900 megawatts of electrical power) powerplants were operational; and total capacity was 6,400 megawatts of electrical power. At yearend, 26 plants of 900-megawatts of electrical power capacity, and six plants of 1,300-megawatts of electrical power capacity were under construction. In addition, plans were announced for construction of eight additional 1,300 megawatts of electrical powerplants.

The French Government and the private sector also were active in mining and processing uranium. Domestic mine output of uranium met about 50% of demand in 1978 and 1979, but France's dependence on African uranium was growing. In 1985, France might produce only 20% of its uranium needs. However, depleted uranium from LWRs, about 80,000 tons, should constitute sufficient resources for over two centuries of French energy requirements. With its plant at La Hague, France could become the leader in the field of commercial reprocessing of oxide fuels.

The Government-owned Compagnie Général des Matières Nucléaires (COGEMA) was the largest uranium producer, with mines at Limousin, Vendée, and Forez. In addition, uranium was produced by Société Central de l'Uranium (SCMURA) at Cantal-Creuse; Compagnie Francaise des Minerais d'Uranium (CFMU) at Lozen and Creuse; Société Industrielle er Minière d'Uranium du Centre (SMUC), a subsidiary of CFMU, COGEMA, and Société des Asphaltes du Centre, at Correze.

The Mineral Industry of Gabon

By Candice Stevens[1]

In the late 1970's, Gabon ranked as Africa's fifth largest petroleum producer, the world's third largest manganese producer, and an important supplier of uranium. The mineral sector was the dominant contributor to the country's economy and accounted for about 60% of the gross national product (GNP) in 1978 and 1979. Ambitious investment plans, however, left the country suffering from an external debt of over $2 billion[2] in 1978. A shortage of foreign exchange was compounded by an inflation rate of 20%, declining petroleum production, and escalating costs for Gabon's major development project, the Trans-Gabon Railroad. In 1978, Gabon adopted an austerity program with technical and financial aid from the International Monetary Fund (IMF). The ambitious third 5-year plan (1976-80) was scaled down from its original planned expenditure of $3.5 billion. In 1979, the economic stabilization program acted to lower the inflation rate to 11%, reduce the external debt to $1.6 billion, and improve the balance of payments. Gabon was preparing a moderate fourth 5-year plan (1981-85) in consultation with the IMF.

Emphasis was placed on petroleum and mineral exploration in Gabon. Extensive prospecting for gas and oil was ongoing both onshore and offshore by a number of foreign companies. The National Geologic Service in conjunction with the Bureau de Recherches Géologiques et Minières (BRGM) (France) continued its geologic survey and mapping program. The focus was on lead-zinc anomalies in the Kroussou region and copper occurrences in the Mayumba and Nyanga regions. The Gabonese Government was negotiating with Aeroservice Corp. (United States) for a project aerial survey of Gabon's mineral resources which was to provide the basis for a new series of geological maps and an overall mineral development strategy. Also in 1978, Gabon was host to a conference of manganese-producing countries who discussed means of improving the global terms of exchange and trade in manganese.

Completion of the Trans-Gabon Railroad was postponed from 1981 to 1987 as construction of the 700-kilometer line fell behind schedule. In December 1978, the first working segment linking Owendo and N'Djole was inaugurated. Yet to be completed were a 155-kilometer section between Booue, Moanda, and Franceville. It had not yet been decided whether to construct a third section between Booue and Belinga, a distance of 250 kilometers. It was estimated that $900 million had already been spent on the railroad, which was to link the Moanda manganese mines, the Mounana uranium mines, and the Belinga iron ore deposits to a new deepwater port at Santa Clara. Construction by EUROTRAG, a 13-company European consortium, was under the general supervision of the Office du Chemin de Fer Trans-Gabonais (OCTRA).

A $100 million mineral port was under construction at Santa Clara, located 25 kilometers north of Libreville, by Soros Associates (United States). The port complex included 800 meters of protective breakwater, storage capacity of 4 million tons, and berths to accommodate ore carriers up to 280,000 deadweight tons. Initially, 150,000-deadweight-ton ore carriers were to be loaded at a rate of 10,000 tons per hour. Completion of the port was to coincide with commissioning of the Trans-Gabon Railroad.

PRODUCTION AND TRADE

Although uranium production increased in 1978 and 1979, production of Gabon's other principal mineral commodities—manganese and petroleum-evidenced a decline. Gabon also produced small amounts of gold and nonmetallic minerals. Mineral production in 1978 was valued as follows: petroleum ($1.1 billion), uranium ($96 million), manganese ($112 million), cement ($12 million), gold ($250,000), and marble ($212,000).

Gabon's balance-of-trade surplus increased from $350 million in 1978 to approximately $500 million in 1979 owing to increased prices for its mineral exports. Petroleum exports accounted for about 72% to 75% of export earnings. Principal destinations of oil exports in 1978 were the United States (24%), Argentina (15%), and France (14%). Mandji crude (79% of exports) was exported from the Cape Lopez terminal, while Gamba crude (16% of exports) and Lucina crude (5% of exports) were exported from their respective loading facilities. Gabon was a member of the Organization of Petroleum Exporting Countries (OPEC) and raised its petroleum prices in accordance with OPEC policy. In 1978, Gabon exported manganese to the United States (33%), France (19%), and Spain (11%). Prior to 1979, Gabon exported all uranium production to France under an exclusive contract. However, at yearend 1978, Gabon concluded an agreement with Azienda Generale Italiani Petroli SpA (Italy) to export 1,500 tons of uranium metal over an 11-year period.

Table 1.—Gabon: Production of mineral commodities

Commodity[1] and unit of measure	1976	1977	1978[p]	1979[e]

COMMODITY REVIEW

METALS

Gold.—Production of gold in Gabon has declined drastically in recent years owing to the depletion of reserves. From 11,000 troy ounces in 1970, output fell to approximately 100 troy ounces in 1979. Gold was produced by smallworkers in the areas of Eteke, Lastoursville, Makokou, and Ndjole and was sold by the Sociètè Gabonaise de Recherche et d'Exploitation Minière (SOGAREM). The number of workers was reported to have fallen from over 2,000 in the early 1970's to less than 100 in 1979.

Iron Ore.—The decision on whether to exploit the Belinga iron ore deposits, located in northeastern Gabon, was postponed until 1982. Exploitation of the deposits was dependent on the completion of a 250-

kilometer section of the Trans-Gabon Railroad linking Booue and Belinga. A study completed by Bethlehem Steel Corp. (United States) in 1978 indicated reserves of 300 million tons averaging 65% iron. The proposed open pit mine at Belinga was to produce between 7.5 million and 10 million tons per year of iron ore commencing in the 1980's. Development of the deposits at an estimated cost of $100 million was to be financed by a European consortium, The Sociètè des Mines de Fer de Mekambo (SOMIFER). Shares in SOMIFER were held by the Gabonese Government (41%), Bethlehem Steel (20%), Exploration Bergbau (Federal Republic of Germany) (10%), Industrialexport (Romania) (5%), Finsider (Italy) (3.5%), BRGM (3%), Solmer (2.4%), Banque de Paris et de Pays-Bas (1%), Hoogovens (Netherlands) (0.5%), and a Japanese group (13.6%). Gabon's other iron ore deposits—at Kokomenguel in the northeast, Latoursville, and Tchibanga in the southwest—were estimated to contain reserves of 1.2 billion tons.

Manganese.—Gabon was the world's largest producer of manganese from a single mine. The country's manganese resources were distributed over five plateaus surrounding Moanda, situated 50 kilometers west of Franceville in the southeast. Reserves at the Bangombe deposit, now under exploitation, were estimated at 100 million tons of ore grading 51% manganese. Reserves at the Okouma plateau, north of Moanda, were estimated at 100 million tons of ore grading 45% to 50% manganese. Reserves of the Yeye, Messando, and Boouba plateaus had not yet been evaluated.

Open pit mining at Moanda was under the direction of Cie. Minière de L'Ogooue SA (COMILOG), owned by the U.S. Steel Corp. (44%), the BRGM (19.8%), the Cie. de Mokta (17.1%), the Gabonese Government (10%), and the Sociètè Auxiliare du Manganese de Franceville (9%). The Gabonese Government was also planning to acquire a 10% to 25% interest in any venture to exploit the Okouma deposit. Production capacity was to increase from 2.7 million tons per year in 1979 to 4 million tons per year following the completion of the Trans-Gabon Railroad. Production capacity in 1979 was limited by the capacity of the chain-conveyer system which transported ore from Moanda to M'Binda on the Congolese border for eventual export from the port of Pointe Noire in the Congo.

High-grade manganese ore was used in the manufacture of batteries at the plant owned by the Sociètè Gabonaise des Piles (SOGAPIL). Production capacity in 1979 was rated at 12 million 1.5-volt batteries per year which were sold for domestic use and exported to the Congo and Zaire. SOGAPIL was owned by the Gabonese Government (20%), Wonder Inc. (20%), and COMILOG (20%), with the remaining shares divided among private banks and individuals.

The construction of a ferroalloys plant at Franceville was dependent on the completion of the Trans-Gabon Railroad and the Grand Poubara dam. The $100 million project was under study by the Sociètè Gabonaise des Ferroalliages (SOGAFERRO) whose principal shareholders were the Okura Trading Co. Ltd. (25%), COMILOG (15%), and the Gabonese Government (10%). Production capacity was planned as 85,000 tons of ferromanganese and 50,000 tons of silicomanganese per year.

Uranium.—Underground exploitation of the Oklo mine began in 1978, and a new yellowcake plant began production in that year. Production by the Compagnie des Mines d'Uranium de Franceville (COMUF) was to reach 1,500 tons of uranium metal by 1982. The construction of infrastructure began in 1979 on the nearby Boyindzi deposit, and the Okelobondo deposit was under evaluation. Total reserves at the three deposits, located in the Mounana area 25 kilometers north of Moanda, were estimated at 20,000 tons of uranium metal. Ore was processed at the new Mounana plant which produced yellowcake containing 70% to 75% uranium metal. Concentrates were sold under contract to the French Commissariate à l'Ènergie Atomique (CEA). A tax revision agreement between COMUF and the Gabonese Government in 1976 provided for greater host Government revenues and a gradual increase in production in the next few years.

Gabon concluded two new agreements with the CEA for uranium exploration. A consortium including the CEA, Union Carbide Corp. (United States), and Leon Tempelsman Co. (United States) was to prospect in the Latoursville-Booue region. A second venture, including the CEA and Power Reactor and Nuclear Fuel Development Corp. (Japan), acquired the Estuary concession covering 4,000 square kilometers in the Cocobeach region.

NONMETALS

Barite.—The BRGM located a small deposit of barite near Mayumba in the southern coastal region. Reserves were estimated at 500,000 tons. Studies were being conducted on the possible exploitation of the barite deposit for use as drilling weight in petroleum production.

Cement.—Production of cement was at low levels owing to a mechanical breakdown in the Sociètè des Ciments d'Owendo clinker-grinding plant. Production capacity of the plant, whose principal shareholders were the Gabonese Government (20%) and Ciments Lafarge SA (France) (71.3%), was 270,000 tons per year. A second clinker-grinding plant, with an annual production capacity of 100,000 tons, was under construction at Franceville by the Sociètè des Ciments de Gabon. To reduce dependence on imported clinker, a new plant at N'Toum was to produce 350,000 tons of clinker per year from local limestone deposits. Shareholders in the Franceville and N'Toum plants were the Gabonese Government (51%), Elf Gabon (19%), Ciments Lafarga (15%), and Sociètè des Ciments d'Owendo (15%).

Talc.—BRGM reported a large talc deposit in the Tchibanga region of Nyanga Province. Reserves were estimated at 100 million tons. Evaluation of the deposits was to continue in 1980. The Gabonese Government was negotiating a $10 million joint venture with Talc d'Usines SA (France) to exploit the deposit.

MINERAL FUELS

Natural Gas.—Gabon's natural gas reserves were estimated at 70 billion cubic meters. Most of the country's associated gas production was flared. Approximately 10% of output was used in power generation and petroleum production.

Petroleum.—*Production.*—Gabon's petroleum production was expected to continue its slow decline if no new substantial discoveries were made. The oil basin of Gabon, approximately 645 kilometers long and 240 kilometers wide, extends along the West African coast south of the Gulf of Guinea. Although there are a few large oilfields, most of the fields are of moderate size and approximately 80% of oil production originates from offshore deposits. Recoverable oil reserves were estimated at 66 million barrels.

Elf Gabon, owned 25% by the Gabonese Government and 75% by Essence et Lubrificants de France-Enterprise de Recherches et d'Activitès Petrolièrs (Elf-Erap), accounted for over 80% of Gabon's production. Gabon's largest field, the Grondin, produced about 50,000 barrels per day of Madji crude. Elf Gabon also held several joint production ventures with other oil companies including Shell Gabon, Gulf Oil Co., Mitsubishi (Japan), and Ocean Drilling and Exploration Co. (United States). Elf Gabon (20%), Shell Gabon (50%), and Gulf Oil Co. (30%) planned to increase production at the offshore Lucina Field from 11,000 barrels per day to 15,000 barrels per day in 1980. Production at the Gamba Field, operated by Shell Gabon, was declining at the rate of 10% per year, and the field was estimated to be 80% depleted. In June 1979, the Gabonese Government established the Sociètè Nationale des Pètroles Gabonais (PETROGAE) and required all petroleum producing companies to deliver 25% of annual output to the national company.

Exploration.—Permits for petroleum exploration were held by about 25 foreign companies prospecting on a total of 46,000 square kilometers onshore and 61,000 square kilometers offshore. The terms of the exploration agreements required producing companies to reinvest up to 10% of their profits in domestic industrial enterprises, Government participation of 25% in case of commercial discovery, refining of 50% of crude output in local facilities, transport of 50% of output by the Gabonese National Maritime Transport Co., the employment and training of local personnel where possible, royalty rates of 20%, and tax rates of 73%. For the first time, the Gabonese Government contributed capital in 1978 to become a partner in exploration activities with British Petroleum, Preussag AG (Federal Republic of Germany), and INA Naftaplin (Yugoslavia). The most active company engaged in oil exploration was Elf Gabon with shares in five offshore and three onshore concessions. Two new discoveries made in the onshore Mayumba tract were under study for possible exploitation by 1981.

Refining.—The Sociètè Gabonaise de Raffinage (SOGARA) refinery at Port Gentil had an annual production capacity of 12 million barrels. The refinery was supplied by crude from the deposits of the Mandji Isle by an 18-kilometer pipeline. SOGARA was owned 51% by the Gabonese Government, 18.75% by Elf Gabon, 18.75% by the

Compagnie Francaise des Pètroles (CFP), and 11.5% by a group of petroleum marketing companies. Production was sold on the domestic market and exported to Cameroon, the Central African Republic, and the Congo. A second refinery came onstream in Port Gentil in 1977 but had yet to reach full capacity. The Compagnie Gabonaise-Elf de Raffinage (COGER) refinery was to produce 10 million barrels per year of petroleum products for export to Western European countries. COGER was owned 30% by the Gabonese Government and 70% by Elf Gabon.

The Mineral Industry of the German Democratic Republic

By George Rabchevsky[1]

As the German Democratic Republic (GDR) marked its 30th anniversary on October 7, 1979, domestic economic growth showed a poor record in all sectors. The country's foreign trade deficit continued, totaling 7.4 billion marks (M)[2] in 1978. Economic growth for 1978 was less than planned and was even worse for 1979; for the first time, the Government did not publish even the semiannual national income figures. Since the founding of the GDR, the U.S.S.R. has supplied the equipment and machinery necessary for the development of the GDR's material and technical base, as well as raw materials and semifinished products.

In 1978 and 1979, the GDR remained the world's leading producer of lignite and potash, producing approximately 27% and 12%, respectively, of total world output. The GDR is relatively poor in all other raw materials and depends significantly on imports for most of its mineral requirements. The net national product (income) grew 4.0% in 1978, and target growth for 1979 was set at only 4.3%. Industry, the backbone of the economy, accounts for 60% of the net national product and employs approximately 40% of the working population. In 1978, industrial production totaled M99.6 billion, up 5.4%, which was just below planned growth of 5.7% and the same as the 1977 growth. The 1979 target growth of industrial production was set at 5.5%, reflecting continued heavy emphasis on the development of industry, with particular stress on expansion of the coal and energy, electronics and data processing, mechanical engineering, and chemical sectors. To achieve the projected productivity, the GDR is developing and introducing labor-saving technologies, and a modest organizational reform has been introduced in industry. This reform increases the number of vertically integrated, semiautonomous "combines" and places greater authority and responsibility in the hands of combine directors. Some of the new combines are now authorized to conduct business with foreign firms.

Overall 1978 actual investment in the economy was 3% over that of the previous year, in contrast to the 2.1% planned increase. In 1979, overall investment was planned to rise 5.6% over that of 1978. Of total industrial investments, 60% was allocated to the fuel and energy, metalworking and metallurgy, prospecting and geology, and chemical sectors. The pace of investment is being accelerated in an effort to replace obsolete industrial plants and raise productivity. The export industry sector was to get the largest share of investments in 1978 and 1979 in order to meet the respective 11% and 10% expansion goals for foreign trade turnover. In 1978, however, the foreign trade turnover fell short of its goal, increasing only 8.9%. In 1978, trade revenues rose 3.5% to M124.9 billion (a 4% increase was planned), and an increase of 5% was planned for 1979. Expenditures in 1978 were the same as in 1977, at M124.1 billion (a 5% increase was planned), and a 5% increase to M137.4 billion was planned for 1979.[3]

In summary, the GDR's economic growth in 1978 and 1979 slowed in almost all sectors, coinciding with rising costs for imported oil, raw materials, and capital goods, forcing the country to take up new loans abroad. In addition, the particularly hard winter of 1979 severely affected the entire economy, even forcing the dismissal of Klaus Seibald, Minister of Coal and Energy.

Future economic programs of the GDR will depend to a large extent on solving problems caused by shortages of fuel and raw materials.

PRODUCTION

Although the GDR is the world's leading producer of lignite and potash, it is considered overall to be a mineral-poor country. The only other mineral commodities of any commercial significance are salt, building sand, and a moderate amount of natural gas. Small quantities of copper and tin are also mined for domestic consumption. The GDR depends heavily on the U.S.S.R. and Council for Mutual Economic Assistance (CMEA)[4] countries for supplies of most raw materials.

Conservation of raw materials and energy and the use of scrap are constantly emphasized. The Ninth Socialist Unity Party of Germany (SED) Congress, for example, set a target to increase the use of secondary raw materials and scrap 30% by 1980. As a conservation measure, the machine tool industry has undertaken to reduce usage of rolled steel in 1979 by 5,850 tons, pig iron by 5,050 tons, and steel castings by 1,400 tons or 4% from that of the previous year. Thus, the 5.5% planned increase in industrial production for 1979 was to be achieved with only 1.7% more primary raw materials. The following tabulation shows the usage of scrap materials (from domestic sources, imports, and stockpile) by the metallurgical industry in 1977 and 1978, in thousand tons:

	1977	1978
Steel scrap	5,868	5,842
Scrap castings	428	426
Copper and alloy scrap	49	50
Lead and alloy scrap	41	45
Zinc and alloy scrap	19	19
Aluminum and alloy scrap	54	53

Source: Neues Deutschland (The New Germany), East Berlin. Apr. 10, 1979, p. 2.

The combines of the Ministry of Coal and Energy were slightly short of their production targets in 1978, but those of the Ministry of Ore Mining, Metallurgy, and Potash slightly exceeded their production quotas. Production of alumina and aluminum metal in 1978 and 1979 dropped slightly. Copper production was also down from that of 1977, while iron and steel production was up slightly. Lead, nickel, tin, and zinc production also showed small gains. No significant gains were made in the nonmetals sector except in potash production, which rose, as expected, about 3%. Lignite, the major mineral commodity of the GDR, and bituminous coal both registered production declines in 1978. Production of manufactured gas showed a 7% gain, while that of natural gas and crude oil was almost unchanged. The GDR has been increasing its imports of crude oil in the past few years, and in 1978 and 1979 there was a corresponding increase in the total output of refinery products.

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, magnesium, peat, and a variety of crude construction materials are produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2]Source indicates that data include "roasted ore," presumably roasted pyrite.

[3]Series revised; figures represent the sum of estimates for silicon metal production (3,000 tons in 1976 and 1977 and 4,000 tons in 1978 and 1979) and reported figures for output of all other ferroalloys (except those for 1979 which are estimated).

[4]Total of listed products only; no estimates have been made for unreported products and/or for refinery fuel and losses.

TRADE

In 1978 and 1979, the GDR imported about 60% of its total raw materials and fuel and energy requirements. During this period, about 35% of industrial production was exported.[5] In 1978, the total foreign trade turnover increased 8.9% to M99.6 billion. In 1979, the foreign trade turnover exceeded the M100 billion level for the first time. Exports in 1978 amounted to M46.1 billion, and imports hovered at M53.5 billion, resulting in a record high trade deficit of M7.4 billion.

Imports of metals are of great significance to the machine-building industry, which is one of the country's most important industrial branches. The required raw products are almost totally imported. In 1978, for example, the pig iron output of 2.6 million tons was made possible by iron ore imports of about 2.0 million tons, and voluminous imports of steel products supplemented the domestic raw steel output of 7.0 million tons. In 1978, as in previous years, the GDR's mineral exports consisted primarily of potash, lignite, rock salt, iron and steel semimanufactures, and some petroleum products. Exports of equipment, machinery, and technical services were stepped up. Reportedly, much of the world's lignite is mined with open pit equipment manufactured in the GDR, including large excavators and conveyor bridges. The U.S.S.R. reportedly placed the largest order ever with the GDR's chemical engineering and equipment industry in 1978. During the 1976-80 period, 26 complete oil refineries are to be supplied to the Tyumen area of Western Siberia, each capable of refining 3.5 million tons of oil per year. The Soviet order also included equipment for processing natural gas.

Approximately two-thirds of the GDR's trade is conducted under bilateral arrangements with other centrally planned economy countries, particularly CMEA members. The GDR provides industrial products, especially machinery, in return for imports of primary products, fuels, and raw materials from Eastern Europe. The GDR's growing trade deficit with CMEA countries continued to be a troublesome factor in its 1978 and 1979 economic development. The U.S.S.R. is the GDR's largest trade partner, and trade between the two countries in 1978 increased 11.3% over that of 1977. All of the GDR's imports of cadmium, lead, pyrite, and carbon black came from the U.S.S.R., as did most of its chromite, iron ore, zinc, asbestos, coke, crude petroleum, and mineral tar and other coal-, petroleum-, and gas-derived crude chemicals. Growth in foreign trade between the two countries was planned for the 1976-80 period. During this period, the U.S.S.R. was to supply the GDR with more than 88 million tons of oil, 21.6 billion cubic meters of natural gas, 21 million tons of coal, and approximately 16 million tons of rolled ferrous metals, as well as large quantities of iron ore and nonferrous metals. An agreement was reached with the Soviet firm Raznoimport for the import of 27,000 tons of nonferrous metals from the U.S.S.R. in 1979, including copper, aluminum, nickel, and zinc.[6] By participating in exploration and development of Soviet deposits, the GDR has assured itself of future procurements from those deposits. Such investment partnerships, which the GDR and the other CMEA countries have entered into, primarily in the energy sector, represent compensation agreements which are spread out over time. Customarily, the GDR supplies preliminary or preparatory services, that are repaid by the U.S.S.R. through raw materials shipments. For such agreements, the GDR plans to invest about M7 billion in the 1970-80 period, or 3% of total planned investments. The U.S.S.R., however, is no longer willing to bear the investment burdens for additional raw materials shipments by itself. Therefore, the continued supply of raw materials and fuels has included an obligation to participate in the increased investment expenditures of the U.S.S.R.

By constrast, the GDR's trade with the industrialized West, dominated by trade with the Federal Republic of Germany (FRG), primarily involves imports of capital equipment and raw materials in exchange for deliveries of chemicals, industrial and light manufactures, and agricultural raw materials. After a drop in 1977, imports from the West in 1978 and 1979 again rose faster than exports, increasing the GDR's deficit. Imports from the FRG rose 4% in 1978, while exports dropped 2%. Imports exceeded average levels in the chemical, nonferrous metals, and iron and steel industries. There were no outstanding trends in exports to the FGR in 1978. The generally weak development of inter-German trade in

1978 is most evident when broken down by commodity group. The following tabulation summarizes the inter-German trade trends for selected mineral commodities:

Commodity	Value (Million Deutsche marks[1])			Percent change from previous year	
	1976	1977	1978	1977	1978
GDR IMPORTS					
Iron and steel (including products)	519.3	424.3	453.4	-18.3	+6.9
Hot wide stripping	66.4	71.6	89.2	+7.8	+24.6
Steel sheets	70.5	71.8	52.1	+1.8	-27.4
Tubular steel products	87.0	58.1	74.9	-33.2	+28.9
Drawn and cold-rolled products	78.1	71.7	58.0	-8.2	-19.1
Nonferrous metals	214.8	302.7	335.2	+40.9	+10.7
Stone and earth	47.2	55.8	45.1	+18.2	-19.2
Mining products, n.e.s	478.6	487.3	372.9	+1.8	-23.5
Coal and coke	131.4	123.0	118.2	-6.4	-3.9
Petroleum and natural gas	327.8	347.8	244.6	+6.1	-29.7
GDR EXPORTS					
Iron and steel	277.5	268.0	254.2	-3.4	-5.1
Rolled steel	201.2	196.0	178.9	-2.6	-8.7
Nonferrous metals	101.0	142.2	147.6	+40.8	+3.8
Stone and earth	83.8	79.8	76.3	-4.8	-4.4
Brown coal	100.4	90.1	89.5	-10.3	-.7
Crude gasoline and fuels	544.8	560.0	551.3	+2.8	-1.6

[1]The Deutsche mark (DM) is currently convertible to U.S. dollars at the rate of DM1.8672=US$1.00.

Source: DIW Wochenbericht (Weekly Report), West Berlin. V. 46, No. 10, Mar. 8, 1979, pp. 111-116.

A long-term bilateral energy agreement for 1980-85 was signed between the GDR and the FRG at the Leipzig Fall Fair in 1979. During this period, the GDR plans to import 950,000 tons of crude oil annually, in return for 1.8 million tons of petroleum products. The GDR also plans to import hard coal worth 250 million Deutsche marks (DM),[7] from the FRG. In 1978, the GDR imported hard coal from the FRG worth DM100,000. The 1979 agreement is significant because the import of oil and hard coal from the FRG was included in the long-term agreement for the first time.

Trade agreements in 1978 included agreements for importing chromium ore, copper, and copper cables from Albania and increasing imports of iron ore and mica from India. The GDR exported services and cooperative projects such as those for development of lignite mining in India's Kutch region and the supply of equipment for a cement plant. In the past 7 years, trade with Cuba has doubled and is now approaching an annual value of M1 billion. The GDR plans to export potash fertilizer to and import nickel from Cuba. In 1978 and 1979, a new turnkey cement works was being built by the GDR at Cienfuegos in Havana, Cuba, with a projected production capacity of 4,950 tons per day, which would make it the largest cement works in Latin America. In the 1981-83 period, a complete small- and medium-section rolling mill is to be supplied to the Jose Marti iron and steel works near Havana by the Ernst Thaelmann combine of Magdeburg. This combine also plans to deliver a small-section rolling mill to Uzbekistan in the U.S.S.R.

According to a 1979 trade agreement, exports to Hungary included 500,000 tons of lignite briquets, 250,000 tons of chemical fertilizers, and 250,000 tons of cement. Imports from Hungary included aluminum but consisted mostly of nonmetallurgical commodities.

Table 3.—German Democratic Republic: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	211	62	Yugoslavia 44.
Carbon black	25,419	24,934	U.S.S.R. 24,634.
Coal:			
Anthracite and bituminous[2] thousand tons	6,058	5,936	U.S.S.R. 3,911; Poland 1,278; Czechoslovakia 603.
Lignite do	3,387	3,332	All from Poland.
Coke[2] do	3,065	2,596	U.S.S.R. 960; Czechoslovakia 795; Poland 494.
Gas, natural[2] million cubic feet	125,402	127,729	Mainly from U.S.S.R.
Petroleum:			
Crude[2] thousand 42-gallon barrels	136,060	146,480	U.S.S.R. 130,536; Iraq 7,878; Syria 2,429; Algeria 2,383.
Refinery products:			
Gasoline do	6	[3]7	Belgium-Luxembourg 4; Italy 3.
Kerosine and jet fuel do	47	28	Hungary 20; Yugoslavia 8.
Lubricants do	[9]203	[9]187	NA.
Distillate fuel oil do	[4]116	[3]129	Denmark 126.
Residual fuel oil do	[9]160	[9]166	NA.
Other:			
Liquefied petroleum gas do	--	([10])	Mainly from Sweden.
Mineral jelly and wax do	--	([10])	All from Netherlands and France.
Bitumen and other residues do	--	1	Mainly from Sweden and France.
Bituminous mixtures do	--	([10])	Do.
Unspecified do	231	510	Poland 430; Romania 80.
Total do	763	1,028	
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	51,862	43,540	U.S.S.R. 41,852.

NA Not available.
[1]Unless otherwise specified, data are compiled from the offical trade statistics of individual trading partners. Owing to a lack of official trade data published by the German Democratic Republic, this table should not be taken as a complete presentation of this country's mineral trade. These data have been compiled from various sources, including United Nations information, data published by the trading partners, and partial official trade sources of the German Democratic Republic.

COMMODITY REVIEW

METALS

The GDR is poor in mineral raw materials, has inadequate production for domestic consumption, and consequently is forced to import most of its metal requirements, except perhaps for nickel and tin. The domestic reserves of copper, iron, lead, and zinc ores are almost depleted, so future prospects for domestic metal ore mining are dismal. All of the GDR's bauxite, lead, and zinc ores were imported in 1978 and 1979. The metallurgical industry, however, is well established and functions efficiently using imported ores.

Production of steel increased from 1977 to 1979, while that of pig iron dropped. Production of nonferrous metals fluctuated; an increase was registered for tin, while copper and alumina showed declines.

Reportedly, a cold-rolling mill for casting or extrusion of bars of copper, brass, and nickel alloys was nearing completion in 1978 at Auerhammer. The VEB Berliner Metall und Halbzeug Werke plans to produce sections 20 millimeters in diameter, rolled into hexagons and rounds with minimum diameters of 3.35 millimeters and 3.4 millimeters, respectively.[8] A plant in East Berlin also produces copper, brass, and aluminum ingots from secondary materials.

Aluminum.—In 1978 and 1979, aluminum consumption continued the rise that began in 1975, reaching an estimated 225,000 tons per year; output of primary metal, however, dropped slightly to an estimated 64,500 tons. The GDR imports most of its primary aluminum from the U.S.S.R.; in 1978, the GDR also traded in primary aluminum with Western countries. A contract was reportedly signed at the Leipzig Fall Fair in 1978 with Hungary's Chemolimpex enterprise for the delivery of a complete aluminum smelter to the GDR.

Production of alumina declined again in 1978 and 1979, and it was reported that the alumina plant at Lauta reached only 67% of its production capacity.

All of the GDR's bauxite is imported, coming mainly from Hungary and Yugoslavia and in 1978 from Greece as well.[9] In 1980, high-grade bauxite may be imported from Guyana; it would be the first high-grade bauxite imported from that country since 1975.[10]

The GDR signed a contract with the French company Cecim at the Leipzig Spring Fair in 1978 for the design and installation of an aluminum foil rolling mill at Merseburg.[11]

Antimony.—The GDR produces antimony at Antimonbergwerk Oberböhmsdorf. Located near Schleiz in Thuringen, this plant produces small amounts of antimony concentrate and metal. It appears, however, that the plant has some difficulty in finding sufficient supplies of raw materials.

Cadmium.—Official statistics on cadmium production are not reported, but 1978 and 1979 estimates remained at 20 tons, as has been estimated for each of the previous 5 years. In 1978, estimated consumption rose to 480 tons from 450 tons in 1977. The GDR's cadmium is derived primarily as a byproduct of the smelting of zinc and other nonferrous metals at two plants in Eisleben and Weide. Much of the domestic requirements for cadmium is met by imports from the U.S.S.R. During the period from October 1978 to September 1979, however, cadmium was also imported from Japan. Reportedly, the GDR was the largest importer of Japanese cadmium.[12]

Copper.—The GDR does not publish its copper production or import figures. In 1978 and 1979, estimated copper production declined; estimated consumption, however, was up to 118,000 tons in 1978 from 115,000 tons in 1977. Because of this, combined with domestic mine closures, copper imports increased significantly, continuing to come mainly from the U.S.S.R.[13]

The GDR's copper deposits are concentrated in the Mansfeld-Eisleben-Hettstedt area but are almost depleted. Reportedly, a longwall system was introduced in the Sangerhausen copper field that significantly reduced mining losses in 1978.[14]

The copper wire mill being built at Mansfeld was scheduled for completion in 1979. It is anticipated that wire will be cast directly from molten copper at this mill, thus eliminating intermediate processes such as the production of copper bars. The mill would be the first to employ this copper-casting and rod-rolling process in any centrally planned economy country.

Iron and Steel.—Production of crude steel in 1979 was up over the 1977 level. Production of iron ore fluctuated, while output of pig iron continued the decline begun in 1977. The per capita output of pig iron had been steadily rising, but in 1978 it dropped for the first time since 1970 to 152 kilograms from 157 kilograms in 1977. The GDR's iron ore reserves are almost depleted, and domestic production of steel and pig iron is inadequate to meet demand. This made the GDR dependent once again in 1978 and 1979 upon imports for a large share of its requirement of these commodities. Almost all of the iron ore and much of the scrap, pig iron, and rolled steel are imported from the U.S.S.R.

There are indications that the GDR's imports of metals were up significantly in 1979, coming primarily from the U.S.S.R., Czechoslovakia, and Poland. The GDR exports substantial quantities of semifinished and finished steel products.

According to some reports, of the more than 160,000 individuals working in the

GDR's ore mining, metallurgical, and potash industries, 130,000 are employed by the ferrous metallurgical industry (iron foundries and steelworks).

Over 75% of the GDR's steel production is from scrap. Starved of indigenous raw materials and faced by spiraling costs on the world market, the GDR has launched a massive press and radio campaign to explain the value of scrap metal, glass, etc., as secondary raw materials. Illustrative of the GDR's campaign to save valuable raw materials was a ruling by the East Berlin Ministry of Construction that forbids, in principle, the use of rolled steel products in aboveground construction, effective January 1, 1978. Exceptions to this ruling can be approved only by the Ministry. According to this ruling, concrete is to be used to a greater extent in structures instead of rolled steel.[15]

In 1978, an order was placed for a new heavy plate steel mill, VEB Stahl- und Walzwerk at Brandenburg, with the Austrian company Vöest-Alpine AG and the FRG firm Schloemann-Siemag. When completed, the mill is expected to produce 500,000 tons of steel plates annually. The order also includes a hot- and cold-dividing shear line. The total mill order is valued at the equivalent of US$267.7 million, and commissioning of the mill is scheduled for 1981 or 1982. The FRG's share of investment in this order is 25%. In return for this order, Austria plans to buy smelting technology from the GDR. The Brandenburg steelmaking plant is presently equipped with open hearths, and the rolling mills include a blooming mill, tube mill, wire rod mill, and 6,500-millimeter slab mill (annual capacity of the slab mill is 3 million tons). Future expansion plans include construction of an electric steelmaking shop with two Asea arc furnaces and two eight-strand Danieli continuous billet casters. The expansion may have been commissioned in 1979, and the shop is slated to have a capacity of 550,000 tons annually.[16]

Reportedly, the GDR's high-grade steel manufacturer VEB Edelstahlwerk (Freital) and the Soviet Institute of Electrothermal Plants jointly developed a 40-ton plasma furnace in 1978 that is especially designed for alloyed and high-alloy steels.

In 1978, the FRG firm Friedrich Krupp GmbH at Rheinhausen handed over for operation the new equipment it installed at the GDR's Wilhelm Florin steelworks and the rolling mill at Hennigsdorf. The new equipment is capable of producing 175,000 tons of electrosteel annually and reportedly cost the GDR DM120 million. The order was filled under a long-term agreement on economic and technical cooperation between Krupp and the GDR. The capacity of the Hennigsdorf steelworks rose to 1.2 million tons.

In 1978, the FRG firm Krupp Industrie- und Stahlbau AG, a subsidiary of Friedrich Krupp, handed over a complete foundry to the GDR firm Industrie Anlagenimport of East Berlin. The foundry, the result of 2 1/2 years of planning and construction, is located near Uckermünde on the Oder estuary. It is designed to produce 16,000 tons of pipe fittings annually and was built at a cost of DM120 million.

Negotiations were underway in 1978 between the GDR and a European consortium led by the Belgian steel firm Cockerill for construction of a completely new 850,000-ton-per-year medium-section rolling mill. It is reported that the GDR is giving priority to expansion of rolling mill capacities in its current 1976-80 5-year plan.[17]

Lead and Zinc.—The GDR's lead and zinc mines are old, and mining has almost ceased owing to ore depletion. The GDR's mine output data for lead and zinc have not been reported for a number of years. The VEB Buntmetall lead-zinc-silver complex at Freiberg, about 25 kilometers northeast of Karl-Marx-Stadt (formerly Chemnitz), is the largest in the GDR and uses imported concentrates in its production. The refined lead capacity is about 20,000 to 25,000 tons annually, of the Saxonia brand. About 15,000 to 22,000 tons of electrolytic slab zinc is produced annually at the same plant.

Most of the GDR's lead and zinc requirements are met through imports from the U.S.S.R. The U.S.S.R. ceased reporting its exports in 1975, in which year the GDR imported 47,000 tons of lead and 40,553 tons of zinc from the U.S.S.R. The estimated consumption of lead in 1978 was 95,000 tons. In addition to imports from the U.S.S.R., the GDR imported in 1978 about 3,400 tons of refined lead from Western countries and reexported 800 tons to these countries.

The GDR's estimated consumption of zinc increased in 1978 to 70,000 tons, a rising trend that has continued for at least the last 5 years. Imports of slab zinc from Western countries in 1978 decreased 86% from the record high of 15,700 tons in 1976, the first year of the current 5-year plan.

Nickel.—The GDR is a significant producer of primary nickel in Eastern Europe. Nickel consumption increased from 9,000 tons in 1974 to about 11,000 tons in 1978.

Over 70% of the GDR's nickel requirements are imported, mostly from the U.S.S.R. Hüttenwerk St. Egidien is the country's main nickel smelter. It is situated close to Glauchau, about 30 kilometers west of Karl-Marx-Stadt, and has a capacity of over 1,200 tons annually. The plant was built after World War II and smelts ore from the nearby Kuchschnappel surface mines in 60-ton furnaces capable of treating at least 100 tons of ore per day.

Another smelter, Hüttenwerk Aue, is situated about 35 kilometers southwest of Karl-Marx-Stadt and produces electrolytic nickel and nickel anodes. A third nickel smelter is Hüttenwerk Oberschlema; its products include nickel cubes, pellets, and salts. A fourth source of domestic nickel is thought to be Hüttenwerk Müldenhutten at Halsbrücke, about 25 kilometers northeast of Karl-Marx-Stadt, just north of Freiberg. The GDR's Kuchschnappel nickel deposits are almost depleted, but in 1978 a new surface mine was reported to have started operations near Freiberg.

Silver.—Production of silver in the GDR, down slightly since the start of the current 5-year plan, has been estimated to average 1.6 million troy ounces annually in the first 4 years of the plan. Because of increasing mining costs and diminishing domestic deposits, most of the GDR's silver requirements are met through imports, coming mostly from the United Kingdom. According to some reports, annual silver consumption had increased to over 16 million troy ounces.

Silver is produced in the GDR as a byproduct of other nonferrous operations. It is believed that almost all domestic production comes from the VEB Buntmetall lead-zinc-silver complex at Freiberg. About 25% of the GDR's domestic silver is reprocessed from secondary materials.

Tin.—In 1978 and 1979, tin mine output and metal production both went up owing to the start of operations in 1977 of a new mine and ore-processing plant at Altenberg and a new tin smelter at Freiberg. Tin and copper are the only significant metallic minerals mined in the GDR. Reportedly, tin production is to be raised 45% by 1980 over that of 1976, primarily through improvement of mining and production technologies.

Consumption of refined tin has risen steadily for the past 5 years to the current estimated level of 3,000 tons per year. Most of the domestic tin deficiency is made up through imports of tinplate from the U.S.S.R. Zinnhütte Freiberg, which is part of the Albert Funk Mining and Metallurgical Complex, uses tin concentrates from the Altenberg, Sadisdorf, and Ehrenfriedersdorf mines, together with 200 to 300 tons of imported concentrate. The older roaster and reverberatory furnaces of the plant use the Saiger (liquation) process for tin production assaying 99.6% to 99.8% tin and 0.03% arsenic, with some copper, lead, bismuth, and iron.

NONMETALS

Barite and Fluorite.—Estimated production of barite and fluorspar increased slightly in 1978 and 1979 and provided for domestic demand and some export. In 1978, barite was exported to Poland, and fluorspar was exported to Poland, Austria, and Norway. Barite and fluorite occur in the GDR as veins, fissure fillings, and replacement deposits in the Thuringian Forest and the Harz Mountains. Both minerals are processed at the Lengenfeld fluorite and barite plant in the southern part of the country.

Cement.—Production of cement continued to rise in 1978 and 1979. Cement imports, coming mostly from the U.S.S.R. with some from Poland, decreased slightly, while exports to Hungary and Yugoslavia increased during the 2-year period. The Karsdorf cement works, the largest in the GDR, began full production of new sulfate-resistant cement in 1978. In 1978, the GDR firm VEB Schermaschinenbau-Kombinat Ernst Thälmann (SKET) in Magdeburg was reportedly seeking licenses in the United States for its dry-process cement production method and the manufacture of equipment for cement clinker production. The process and equipment were developed by the engineering enterprise Zementanlagenbau in Donau. Licenses for the dry-process cement method and equipment have already been sold to Western European engineering firms.

It was reported that the cement works at Donau built a crusher in 1979 that is able to pulverize 160 tons of clinker per hour. The new crusher is 70 tons lighter and more energy efficient than existing ones, and plans are to export the crusher to Cuba, Bulgaria, Yugoslavia, and Syria.

Chalk.—The GDR is self-sufficient in chalk and exports much of its domestic production. Chalk continues to be mined on Rügen Island, Europe's largest chalk deposit, and is processed by VEB Kreidewerke Rügen near Sassnitz.

Clay and Sand.—The GDR has considerable deposits of silicate minerals such as quartz sand, kaolin (china clay), and other clays. From 1970 to 1975, the GDR increased its output of these raw materials 150%. To meet expanding domestic needs, the country plans to increase output of these silicate minerals at an even greater rate as part of the current 5-year plan. VEB Silikatrohstoff-Kombinat Kemmlitz manages the silicate mining industry. By some estimates, the combine employs a force of some 2,000 workers and in 1979 produced over 3.5 million tons of quartz sand, kaolin, and other clays.[18]

The GDR's current 5-year plan calls for an annual increase of 5% to 6% in the production of clay. The ceramics and glass industry meets almost 96% of its requirements from indigenous deposits. Approximately 3 million tons of fireproof and ceramic clays, kaolin, vitreous sand, and quartzite are extracted from as many as 36 surface and underground mines. Bentonite and kaolin are also exported and imported. The kaolin deposits near Bautzen are the richest in the GDR. The country's only blue clay deposit is surface mined at Grimmen, about 65 kilometers east of Rostock, to a depth of 20 meters, from a pit about 20 hectares in areal extent. About 850 cubic meters of clay is mined per day. Much of the clay is used as an insulating aggregate in the production of construction slabs.

According to W. Greiner-Petter, Minister of the Glass and Ceramics Industry, clay in the GDR has been surface mined for the last 100 years, but because of depletion, the depth of the surface mine operation will go to over 80 meters. This will necessitate the use of large overburden stripping equipment and machinery which until now has been used only by the lignite industry. Reportedly, the first such machine has been put into stripping operation at the Glassandwerk Hohenbocka vitreous sand quarry in the Cottbus area. Sand deposits of low iron content are still being mined in Lausitz and Magdeburg, and according to Dieter Noack, Director of VEB Silikatrohstoff-Kombinat Kemmlitz, studies are underway for converting these low-grade quartz sands into high-grade quartz sands with low iron content.

Fertilizer Materials.—In 1978 and 1979, total fertilizer production again registered an increase, surpassing 6 million tons in nutrient content in 1978. As in previous years, potassic fertilizer made up 72% of this production, nitrogenous fertilizers 19%, and phosphatic fertilizers 9%. The GDR imports large quantities of crude phosphate, mostly from the U.S.S.R., and some manufactured phosphatic fertilizers, mostly from the FRG. Nitrogenous and potassic fertilizers are also imported, but in smaller quantities. The GDR reexports some crude phosphate and some manufactured phosphatic, potassic, and nitrogenous fertilizers.

Nitrogenous.—Production of manufactured nitrogenous fertilizers has continued to increase slightly but steadily since 1973. The GDR imported nitrogenous fertilizers and exported some to various European countries, mostly to Hungary and the United Kingdom. Negotiations began in 1978 between Coppee Rust of the United Kingdom and the GDR for the modernization and refurbishment of an existing calcium ammonium nitrate plant at Schwedt. Reportedly, some equipment may have to be replaced owing to corrosion problems. In 1979, it was reported that the GDR planned a grass-roots nitrogenous fertilizer complex to be built by the French contractor Creusot-Loire. The plans call for construction of a new storage terminal at Rostock on the Baltic coast. The U.S.S.R. is to supply the 350,000 tons per year of ammonia to be used as feedstock in the new complex; the ammonia would be shipped 10 kilometers by a pipeline to the complex. The complex is to comprise units with capacities of 2,400 ton per day of nitric acid, 3,400 tons per day of calcium ammonium nitrate, 150 tons per day of porous ammonium nitrate, and 70 tons per day of crystalline ammonium nitrate. The cost of the terminal, pipeline, and fertilizer complex is set at about US$200 million. Construction was to begin in 1979, and commissioning is scheduled for the end of 1983. The GDR plans to furnish its own equipment for installation at the Rostock complex and to build a power station adjacent to the site without outside assistance.[19]

Phosphatic.—Production of phosphatic fertilizers picked up in 1978 and 1979 from the slight downward trend of the previous 3 years. The GDR continued to import large quantities of raw phosphate and apatite concentrate and smaller amounts of manufactured phosphatic fertilizer, but all in lesser quantities than in 1977. Imports of manufactured phosphatic fertilizer in 1978, for example, decreased about 27% from the previous year's level. The major portion of the raw phosphate is imported from the U.S.S.R. For the past several years, the GDR has also imported raw phosphate from Tunisia. In 1979, the GDR reportedly committed itself to purchasing even larger quantities of Tunisian phosphate on a long-term basis. These imports reflect the policy of the centrally planned economy countries to penetrate the Tunisian market by purchasing more phosphate in exchange for increased Tunisian purchases. The GDR has virtually no phosphatic raw materials, which accounts for the high level of imports. The GDR did, nevertheless, export some phosphatic fertilizers (both raw and manufactured) to some Eastern and Western European countries.

Potassic.—The GDR in 1978 and 1979 remained the world's third leading producer of potash (producing about 12% of the world total) and continued to increase production. The country also maintained its position as the second largest exporter of potash. Over 46% of the GDR's potassic fertilizer is exported to centrally planned economy countries, with exports to many other parts of the world as well. The GDR's exports show a continuous slight increase since the start of the current 5-year plan. Next to the U.S.S.R., the GDR is the main supplier of potassic fertilizer to Czechoslovakia, Hungary, and Poland.

With the Zielitz mine operating at full capacity and minor expansion at some of the older mines such as Thomas Müntzer, the GDR's potash industry should be able to produce 3.5 million to 3.8 million tons of K_2O by 1980. Thus, only minor expansion is expected in the last year of the current 5-year plan. Although recovering somewhat in 1979, domestic consumption of potash fell markedly in recent years and was lower both in 1977 (at 471,700 tons) and 1978 (at 569,000 tons) than in 1970 (at 613,900 tons).[20]

The GDR's identified potash reserves are estimated at 300 million to 900 million tons of K_2O, and total reserves are estimated at over 7 billion tons. The four potash enterprises are managed by VEB Kombinat Kali. Each enterprise is located at the site of a deposit being mined. All of the GDR's mines are underground, employing the room-and-pillar method. The following tabulation presents data on GDR's four potash enterprises and their capacities:[21]

Potash enterprise and mine location	Ore type and concentration (percent K_2O)	Depth of mine (meters)	Type of refinery	Product	Annual capacity (thousand metric tons K_2O)
Kalibetrieb Werra:					
Unterbreizbach	Carnallite (13-15)	800	Crystallization.	KCL and K_2SO_4.	320
Merkers	do	800	do	do	480
Dornoff	do	800	do	do	290
Total					1,090
Kalibetrieb Zielitz:					
Zielitz	Sylvinite (15)	700-800	Flotation	KCL	1,100
Kalibetrieb Süd-Harz:					
Rossleben	Hartsalz (14-15)	400-1,000	Flotation and crystallization.	KCL and K_2SO_4.	290
Sondershausen	Hartsalz (13)	400-1,000	do	do	190
Sollstedt	Hartsalz (12-13)	400-1,000	do	do	160
Menteroda/ Volkenroda.	Sylvinite (12-13)	400-1,000	do	do	130
Bleicherode	Hartsalz (13-14)	400-1,000	do	do	190
Bischofferode (Thomas Müntzer).	Hartsalz (12)	400-1,000	do	do	250
Total					1,210
Kali und Steinsalzbetrieb Saale:					
Teutschental	Kieserite and Hartsalz (7).	400-1,000	do	do	30
Grand total					3,430

In 1978 and 1979, the GDR continued to invest in expansion of its potash industry. The Zielitz potash enterprise in the Magdeburg area, for example, is planning an expansion at a cost of M120 million. The project was scheduled to begin in March 1979 and is scheduled for completion in spring of 1981. Under a contract with Industrieanlagen Import-Corporation, Kloeckner Industrieanlagen GmbH is to build a plant for production of granulated potash fertilizer. One of Kloeckner's partners in the project is to be Philipp Bros. of the United States.

MINERAL FUELS

The GDR is deficient in fossil fuels such as petroleum, natural gas, and hard coal, and thus is forced to import most of these. For cost-saving purposes, the GDR is utilizing as much of its single abundant energy source, lignite, as possible. Lignite, which is available domestically in abundance, accounts for two-thirds of domestic primary energy consumption. The GDR meets over 97% of its petroleum requirements from abroad, including about 90% from the U.S.S.R. The small domestic natural gas yield (about 8.5 billion cubic meters) is supplemented exclusively by imports from the U.S.S.R. The GDR has recently become an importer of metallurgical hard coal for its smelter industry. Overall, the dependence of the energy industry on foreign deliveries has increased steadily. To date, the most important supplier remains the U.S.S.R.

Electric energy in the GDR is generated from all existing sources, including coal, petroleum, gas, uranium, and hydropower. In 1979, just over 100 billion kilowatt-hours of electric energy was generated. The estimated current electric power capacity of the GDR is 18,500 megawatts. The GDR is planning to intensify its research into generation and utilization of solar energy for heating industrial and residential buildings, as well as other installations. The GDR is a high energy user, and officials are attempting to curb consumption of energy resources an average of 4%. New powerplants, however, are still being planned. Jeanschwalde, near Cottbus, for example, is the site of the next large powerplant which will utilize lignite from nearby surface mines. It is expected that this plant will require several years of construction and will employ up to 6,000 workers during construction.[22]

In 1979, the Ministry of Coal and Energy and the Price Office ordered increases of up to 3% in energy prices to go into effect in 1980. The increases were intended to encourage conservation and counter growing Soviet criticism that CMEA countries, including the GDR, are not doing enough to conserve energy. Price increases for electricity, oil, and natural and manufactured gas in 1980 are expected to mainly affect industrial users; consumer prices are to remain unchanged by increasing subsidies. Furthermore, according to official reports, the Ministry now has direct authority to issue directives to individual areas and districts on the economic use of energy, supplies of heat to centrally heated housing complexes, and supplies of solid fuels. The districts were ordered to build up sufficient fuel stocks to bridge any possible supply delays. In 1979, Klaus Siebold, Minister of Coal and Energy, was dismissed and replaced by Wolfgang Mitzinger. Siebold's replacement resulted from the collapse of energy supplies during the winter of 1978-79, allegedly caused by his inefficient management.[23]

Total estimated primary energy balances for 1978 and 1979 are shown in table 4.

Table 4.—German Democratic Republic: Primary energy balance for 1978 and 1979

(Million tons of standard coal equivalent[1])

Year	Total primary energy	Coal (lignite, brown, bituminous)	Crude oil and petroleum products	Natural and associated gas	Hydroelectric power	Nuclear power
1978:						
Production[2]	96.0	83.7	0.1	11.4	0.2	0.6
Imports	41.3	7.0	29.3	4.8	.2	--
Exports	.8	.7	--	--	.1	--
Apparent consumption	136.5	90.0	29.4	16.2	.3	.6
1979:						
Production[2]	96.5	84.2	.1	11.4	.2	.6
Imports	41.5	7.0	29.3	5.0	.2	--
Exports	.8	.7	--	--	.1	--
Apparent consumption	137.2	90.5	29.4	16.4	.3	.6

[1]1 ton standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are: Bituminous coal, 1.0; lignite and brown coal, 0.33; crude oil, 1.47; natural gas, 1.33 (per thousand cubic meters); and hydroelectric and nuclear power, 0.123 (per thousand kilowatt-hours).

[2]Derived from table 1.

Coal.—In 1978 and 1979, the GDR remained the world's third largest producer of lignite. In 1978, the GDR produced over 27% of the world's lignite, exceeding the Soviet's share. The GDR's VEB Schwermaschinenbaukombinat TAKRAF claimed to be the world's largest manufacturer of surface coal mining machinery. The equipment is used domestically for stripping over 1.1 billion cubic meters of overburden annually and is also exported to the U.S.S.R., Bulgaria, Czechoslovakia, Hungary, Poland, Romania, Yugoslavia, Austria, and Greece.[24]

No other country in the world is as dependent on lignite as an energy resource as the GDR. In 1978, over 81% of the country's electric energy was produced from lignite, extracted from 35 surface mines. In the foreign trade sector, the GDR exports both lignite and coal mining machinery. In order to provide itself a stable supply of energy to meet the increasing consumption, the GDR must produce at least 260 million tons of lignite in 1980. Increased production is expected to become more difficult and expensive, however, while the unit fuel value of the GDR's lignite is expected to decrease. More overburden has to be removed, mines are deeper, and coal seams are thinner than in the past; and these factors necessitate more and larger mining machinery for work in complex geological conditions. Nevertheless, lignite remains the GDR's most abundant and cheapest fuel. According to some official sources, the cost of lignite fuel at present is about half the cost of oil or natural gas.[25]

In the coming decades, lignite is expected to remain the main source of the GDR's primary energy. The amount of lignite mined is to be increased to nearly 280 million tons by 1990. By that time, however, about 5.5 cubic meters of overburden per ton of lignite would have to be removed, instead of the 3.5 to 4.0 cubic meters per ton that is presently removed. By that time, the heating capacity of some lignite is expected to decrease to below 2,000 kilocalories per kilogram, so that larger amounts of fuel would be necessary to produce 1 kilowatt of electric energy. By some estimates, however, remaining lignite reserves of the GDR will last only another 20 years.[26]

The GDR decided to increase purchases of coal and coke from the FRG in 1979 because deliveries of coal from Poland, the U.S.S.R., and Czechoslovakia were interrupted in 1978. The Ministry of Foreign Trade announced that this coal, intended primarily for industry, will be supplied from the Saarland and the Ruhr. The Saarbergwerke is expected to supply about 150,000 tons of coke and 200,000 tons of coal to the GDR in 1979.

As a result of a 1976 agreement between the GDR and the FRG, the GDR in 1978 commenced preparatory work on lignite deposits just southeast of Helmstedt in the FRG, where the lignite reserves are situated on both sides of the border. The GDR plans to open 6 to 10 new open pits, with a total annual capacity of about 160 million tons, to compensate for the anticipated closure of 21 older mines. There are plans to expand the capacities of five surface mines. In 1978, three new strip mines were planned for development near Delitzsch, just north of Leipzig, with a processing center to be located in Kreis. The Delitzsch-Kreis is intended to become a new coal and energy center in 1990, producing some 10% of all lignite and 5% of all electric energy in the GDR. Annual production from the three mines is estimated at 27 million tons, and the reserves are expected to last beyond the year 2000.

The Groitzscher Dreieck lignite mine, with an annual capacity of 5 million tons of lignite, began full operation in 1978. The Groitzscher mine is the fourth of several new surface mines due to go into production by 1980. It has reserves of about 200 million tons in an area of some 13 square kilometers. The Leipzig area accounts for about 25% of the GDR's lignite production.

Continuous operation began full swing in 1978 at the new surface lignite mine at Schlabendorf Sud, part of the Jugend lignite enterprise in the Cottbus district, with a planned output of 18 million tons in 1979. The mine is to supply the Lubbenau-Vetschau and other power stations and is the second of the new surface mines planned as part of the 1976-80 5-year plan. The mine uses two TAKRAF overburden conveyor bridges transferred from the depleted lignite mines of the Schlabendorf Nord and Seese areas.[27]

The largest surface lignite mine in the GDR was being developed in 1978 and 1979 near the Gross-Lieskow area as part of the Jänschwalde lignite complex. The thickness of the overburden is 50 meters, cleared by a 60-meter overburden conveyor bridge. The start of production is planned for 1981 at an annual rate of 15 million tons of lignite, eventually scheduled to increase to 20 million tons when the mine is fully developed.[28]

Natural Gas and Petroleum.—The year 1979 marked the completion of the Orenburg gas pipeline (also referred to as Alliance or Soyuz), the greatest joint construction project to date of the CMEA countries. The project agreement was signed in June 1974, and construction began in 1975 on the 2,750-kilometer pipeline. A cooperative construction effort was undertaken to build the Orenburg condensed-gas storage facility in the Urals and the gas pipeline from Orenburg to the Ukraine on the western border of the U.S.S.R. The GDR undertook construction of approximately 260 kilometers of the line with its own funds and workers. A delivery of 15.5 billion cubic meters of natural gas from the U.S.S.R. to the signatory countries was agreed, 2.8 billion cubic meters of which is to be received by the GDR.

The GDR uses Soviet natural gas in its chemical industry, in metallurgy, and in its glass and ceramics industry. The Orenburg gas is eventually expected to lead to a doubling of the GDR's natural gas imports. It is estimated that imports of Soviet natural gas in 1980 will reach an alltime high of 5.0 billion to 5.6 billion cubic meters.[29]

By some accounts, the GDR's apparent consumption of natural gas in 1978 exceeded 12 billion cubic meters, and reserves were calculated at 84 billion cubic meters (excluding probable and possible reserves).[30]

In addition to natural gas, the GDR also manufactures about 4 billion cubic meters of coal gas at the VEB Gaskombinat Schwarze Pumbe in the Cottbus district. The coal gas facility is also responsible for the operation of 7,000 kilometers of the GDR's gas pipeline network and together with its other facilities employs about 25,000 workers. The facility also receives Soviet gas through the Orenburg pipeline. Some of this gas is added to the coal gas together with imported propane and other components, but most is pumped into the national gas network. Reportedly, efforts are underway to change over East Berlin's gas supply from coal gas to natural gas.

The U.S.S.R. supplies up to 97% of the GDR's crude oil supplies. The GDR's 1980 imports of Soviet crude oil are set at 18 million tons.

A tentative agreement was reached between the GDR and the FRG in 1979 for the GDR to import 950,000 tons of crude oil annually from the FRG between 1980 and 1985, with a provision for an increase of up to 1.14 million tons. The GDR, on the other hand, will ship to the FRG—especially to West Berlin—about 1.79 million tons of petroleum products, with a provision for increases of up to 2.2 million tons.[31]

In order to find new oil reserves off the Baltic coast and the surrounding area, an organization known as Petrobaltic was recently formed by the GDR, the U.S.S.R., and Poland. A detailed survey of the area has been completed by the Leningrad Institute of Geological Petroleum Exploration, and a letter of intent has been signed by the Soviet and Polish Governments for joint construction of a drilling vessel for use in the Baltic. The GDR is very much interested in this venture as it may represent its best hopes of discovering oil resources of any size. Actual drilling is expected to start in the 1980's.[32]

In 1979, the Rostock oil port was modernized, allowing the docking of larger tankers and the unloading of oil in less than one-third the time previously required. According to reports, 41,000 to 45,000 tons of oil can be pumped into storage in less than 24 hours. The deepened 10-kilometer channel and port are able to handle ships with a load capacity of up to 45,000 tons.[33]

Nuclear Power.—In 1979, there were four nuclear plants in operation in the GDR. Two 440-megawatt units were under construction in the Magdeburg District at Stendal and are scheduled for completion in 1980. The construction and technical knowhow were supplied by the U.S.S.R., as in all previous nuclear projects. The third block of the Bruno Leuschner nuclear powerplant near Greifswald began operation in 1978 at the projected output of 440 megawatts. With the completion of the third block, the Bruno Leuschner plant reached a total capacity of 1,320 megawatts and became the GDR's third largest powerplant.

According to some estimates, the GDR's nuclear operating capacity in 1978 and 1979 was 2,180 megawatts, and the 1980 capacity was set at 3,560 megawatts, or over 5% of the nation's present electric energy production. By some accounts, the first breeder reactor in the GDR is to become operational around 1985.

According to estimates, the GDR's annual production of uranium may be as much as 12,000 to 18,000 tons, or three times the 1970 output. Some reports calculate the GDR's assured uranium resources at 60,000 tons and additional uranium resources at 200,000 to 500,000 tons. Uranium is exported to the U.S.S.R.

Taking into account the depletion and unavailability of domestic mineral fuels and the rising cost of imports, the GDR has placed the development of atomic energy in the forefront of its energy plans. By 1980, 10% of the GDR's electricity may well be generated from nuclear energy, and by the year 2000, nuclear energy is expected to provide 40% of the nation's electricity.

The Mineral Industry of the Federal Republic of Germany

By Joseph B. Huvos[1]

After a slow start, the economy of the Federal Republic of Germany picked up momentum during the second quarter of 1978, and real growth for the year reached 3.5% and 4.2% for 1979, while unemployment decreased to about 3.8%. The country's gross national product (GNP) by yearend 1979 was about $729 billion,[2 3] to which the country's minerals industry contributed about 16%.

The Federal Republic of Germany remained one of the world's major processors and consumers of minerals, most of which had to be imported except for coal, potash, and salt, of which there was a plentiful supply in the country. The securing of the supply of raw materials remained one of the Federal Republic of Germany's chief objectives. Contribution of the individual sectors of the mining and minerals processing industry in 1978-79 is shown in the tabulation below:

	Contribution to gross national product (million dollars)[1] 1978	1979	Average 1979 employment (thousand persons)
Coal mining	10,029	12,423	205
Stones and earths	13,329	15,761	193
Iron and steel	21,574	25,344	288
Nonferrous metals	8,846	11,541	76
Chemical including petroleum	59,470	70,150	560
Total	113,248	135,219	1,322

[1]Does not include value added tax.

PRODUCTION

Notable events in the Federal Republic of Germany's mineral industry included a 45-day strike in the steel industry, various decisions by several Federal Republic of Germany steel companies in favor of ongoing projects aimed at modernizing plants and equipment in the steel industry, and granting of a loan by the European Communities to Thyssen AG for installing environmental equipment. In the coal industry, coal subsidies were raised from 4.5% to 6.2%, and production started at the Hambach Lignite Mine. In the nuclear power industry, one new nuclear powerplant was commissioned, and the Federal Republic of Germany Government decided in 1978 to build both a nuclear fuel enrichment plant and a nuclear fuel reprocessing and waste storage plant. In the petroleum industry, a deal for a $414 million exchange of assets between the British Petroleum Co. (BP) and VEBA AG and the country's strategic petroleum reserve law were both implemented.

Production of mineral commodities in 1976-79 is shown in table 1.

Marketable ___ do	2,197	1,749	2,087	2,100
Pyrite, marketable concentrate, gross weight ___ do	523	531	502	590
Quartz, quartzite, glass sand:				
Quartzite ___ do	372	425	411	[1]426
Quartz sand, ground ___ do	418	407	421	[1]454
Quartz sand, unground and glass sand ___ do	6,111	6,737	7,026	[1]7,417
Salt, marketable:				
Rock ___ do	6,375	7,131	6,846	6,800
Marine and other ___ do	4,942	5,192	5,812	5,900
Sodium compounds:				
Sodium carbonate	1,363,528	1,350,543	1,229,722	1,200,000
Sodium sulfate	256,677	242,247	211,000	210,000
Stone, sand and gravel, n.e.s.:				
Dimension stone ___ thousand cubic meters	194	215	326	[1]333
Limestone, industrial ___ thousand tons	52,615	48,953	50,995	[1]54,521
Crushed and broken stone ___ do	102,215	110,718	118,096	[1]109,147
Slate[5] ___ do	2	2	3	[1]3
Basalt lava and lava sand ___ do	5,922	6,623	7,047	NA
Calcite ___ do	4	9	12	NA
Grinding stone ___ cubic meters	48	63	238	[1]71
Tuff ___ thousand tons	3	2	3	NA
Sand and gravel ___ do	155,010	170,425	184,786	[1]198,637
Sulfur:				
S content of pyrite ___ do	233	235	221	260
Byproduct of:				
Metallurgy ___ do	390	385	380	380
Natural gas ___ do	460	631	650	650
Petroleum ___ do	119	186	190	190
Unspecified ___ do	161	165	160	160
Total ___ do	1,363	1,602	1,601	1,640
Talc, including talc schist ___ do	18	16	15	16
MINERAL FUELS AND RELATED MATERIALS				
Carbon black	292,322	301,678	297,509	[1]340,629
Coal:				
Anthracite ___ thousand tons	6,628	6,067	6,942	[1]7,018
Bituminous coal ___ do	82,641	78,773	76,994	[1]79,301
Lignite ___ do	134,493	122,920	123,559	[1]130,579
Total ___ do	223,762	207,760	207,495	[1]216,898
Coke:				
Metallurgical ___ do	31,951	27,499	25,455	[1]26,501
Gashouse ___ do	971	809	782	[1]937
Total ___ do	32,922	28,308	26,237	[1]27,438
Fuel briquets:				
Of anthracite and bituminous coal ___ do	1,357	1,305	1,453	[1]1,673
Of lignite ___ do	4,390	4,104	3,889	[1]4,752

See footnotes at end of table.

Table 1.—Federal Republic of Germany: Production of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1976	1977	1978[p]	1979[e]
MINERAL FUELS AND RELATED MATERIALS —Continued				
Gas:				
Manufactured (excluding that from petroleum refineries):[6]				
Blast furnace million cubic feet	201,399	174,312	179,857	[1]212,629
Coke oven[7] do	263,517	223,294	205,848	[1]214,324
Other do	76,915	70,735	72,818	[1]52,760
Total do	541,831	468,341	458,523	[1]479,713
Natural:				
Gross do	665,537	678,565	726,898	NA
Marketable do	658,050	637,578	707,156	NA
Peat:				
Agricultural use thousand tons	1,707	1,911	2,047	2,100
Fuel use do	227	221	228	250
Petroleum:				
Crude thousand 42-gallon barrels	39,902	39,021	36,541	NA
Refinery products:				
Gasoline, aviation and motor do	147,439	123,479	127,069	[1]182,800
Jet fuel do	10,799	10,099	10,620	[1]10,345
Kerosine do	378	456	334	[1]523
Distillate fuel oil do	301,929	293,903	292,020	[1]345,621
Residual fuel oil do	158,397	143,004	160,047	[1]146,333
Lubricants do	9,081	6,763	6,653	[1]9,660
Other:				
Liquefied petroleum gas do	32,680	38,741	37,932	[1]36,669
Bitumen do	23,063	22,421	22,866	[1]23,756
Unspecified do	98,534	86,999	[e]76,555	[1]97,846
Refinery fuel and losses do	38,230	46,253	54,362	[1]99,807
Total do	820,530	772,118	788,458	[1]953,360

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]Reported figure.
[2]Revised to none.
[3]Primary nickel and nickel contained in ferronickel, Monel metal, and nickel oxide directly used by the steel industry.
[4]Produced in part from imported crude graphite.
[5]Exclusive of slate recovered from mine dumps.
[6]Natural gas equivalent is 240 kilocalories per cubic foot (8,400 kilocalories per cubic meter).
[7]Includes water gas and generator gas from coke ovens.

TRADE

In 1978, the total Federal Republic of Germany trade surplus amounted to $21.9 billion, of which the trade surplus with the United States was $1.4 billion, double that of the previous year, and the trade surplus with members of the Organization of Petroleum Exporting Countries tripled to $2.75 billion. In 1979 the trade surplus shrank significantly. The members of the European Communities remained the Federal Republic of Germany's principal trading partners. Total mineral trade of the Federal Republic of Germany in 1977-78 is shown in tables 2-3.

Table 2.—Federal Republic of Germany: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite	9,327	12,260	Belgium-Luxembourg 6,868; France 3,656.
Alumina	231,518	344,606	Canada 111,740; Spain 80,912; U.S.S.R. 25,637.
Aluminum hydroxide	118,543	120,544	Sweden 36,148; Netherlands 21,505; France 16,432.
Metal including alloys:			
Scrap	48,092	52,982	Italy 17,010; Netherlands 15,245; France 14,216.
Unwrought	199,136	271,610	France 62,690; Italy 60,986; Netherlands 48,861.
Semimanufactures	307,838	343,982	France 62,046; Netherlands 36,445; United Kingdom 32,639.
Antimony:			
Ore and concentrate	132	--	
Metal including alloys, all forms	216	20	United States 1.
Arsenic trioxide, pentoxide, acids	58	NA	
Beryllium metal including alloys, all forms kilograms	1	15	NA.
Bismuth metal including alloys, all forms	462	517	United Kingdom 166; United States 153; Denmark 41.
Cadmium rhenium and metals including alloys, all forms	274	313	Iran 6.
Chromium:			
Chromite	3,931	3,212	Canada 1,002; France 605; Austria 354.
Oxide and hydroxide	11,709	47,668	NA.
Metal including alloys, all forms	63	125	Belgium-Luxembourg 43; Japan 33; Italy 17.
Cobalt:			
Oxide and hydroxide	41	86	Netherlands 31; Belgium-Luxembourg 15; France 10.
Metal including alloys, all forms	340	796	Romania 21; Switzerland 16; Belgium-Luxembourg 10.
Columbium and tantalum metals including alloys, all forms:			
Columbium kilograms	11,074	19,109	Switzerland 707; France 201; Poland 199.
Tantalum do	60,924	47,122	France 2,295; Yugoslavia 191; Hungary 176.
Copper:			
Ore and concentrate	--	(1)	NA.
Matte	338	300	Belgium-Luxembourg 240.
Copper sulfate	1,593	1,861	NA.
Metal including alloys:			
Scrap	46,340	53,956	Italy 18,871; France 9,004; Austria 6,377.
Unwrought:			
Smelter	32,364	29,589	United Kingdom 25,817; Belgium-Luxembourg 3,324.
Refined:			
Alloyed	7,336	8,064	Italy 1,753; France 1,231; Belgium-Luxembourg 1,050.
Unalloyed	66,954	112,695	Belgium-Luxembourg 21,799; Italy 16,944; India 15,482.
Master alloys	1,058	1,283	Belgium-Luxembourg 687; France 394.
Semimanufactures	248,214	319,822	Netherlands 40,704; France 34,450; Belgium-Luxembourg 31,475.
Gallium metal including alloys, all forms kilograms	11,200	5,600	Japan 1,400; United States 1,300; Netherlands 900.
Germanium metal including alloys, all forms do	200	400	All to United States.
Gold metal:			
Ash and waste do	1,863	607	NA.
Scrap and sweepings troy ounces	228	1,403	France 1,050; Switzerland 303.
Unwrought thousand troy ounces	569	1,433	Switzerland 548; Thailand 187; Italy 136.
Semimanufactures troy ounces	193,188	194,531	United Kingdom 44,379; Israel 37,047; Japan 24,796.
Iron and steel:			
Ore and concentrate	3,292	5,855	Austria 2,682; Belgium-Luxembourg 539; Greece 358.
Roasted pyrite	244,788	184,218	Belgium-Luxembourg 103,355; Austria 42,096; Switzerland 16,395.
Metal:			
Scrap thousand tons	2,481	2,765	Italy 2,017; Belgium-Luxembourg 358; France 95.
Pig iron, including cast iron do	704	736	France 370; Poland 114; Italy 94.
Sponge iron, powder, shot do	46	57	France 13; United Kingdom 13; Switzerland 9.
Spiegeleisen do	520	2,716	United States 1,065; Egypt 500; Italy 475.

See footnotes at end of table.

Ferroalloys:			
Ferrochrome	36,426	31,419	France 9,535; Italy 6,343; United States 4,870.
Ferromanganese	74,037	49,391	Belgium-Luxembourg 14,147; Italy 13,556; France 6,020.
Ferronickel	54	8	NA.
Ferrosilicon	23,244	25,818	France 5,114; Netherlands 1,403; Belgium-Luxembourg 1,066.
Ferrosilicochrome	1,630	1,623	Italy 1,158; Belgium-Luxembourg 312; Austria 83.
Ferrosilicomanganese	2,215	742	France 446; Italy 130.
Other	15,970	13,436	Romania 1,771; United States 1,760; Poland 1,257.
Steel, primary forms thousand tons	2,599	3,214	France 698; Italy 272; Algeria 205.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	3,255	3,725	France 717; Netherlands 477; Iran 400; United States 279.
Universals, plates, sheets do	5,393	6,345	U.S.S.R. 1,233; United States 1,070; France 635.
Hoop and strip do	1,095	1,221	U.S.S.R. 185; France 147; Netherlands 145.
Rails and accessories do	150	182	Italy 51; Netherlands 26; United States 14; Switzerland 12.
Wire do	287	282	France 54; Netherlands 41; Belgium-Luxembourg 31.
Tubes, pipes, fittings do	2,791	3,691	U.S.S.R. 955; China, mainland, 515; Netherlands 423; Mexico 205.
Castings and forgings, rough do	110	113	Belgium-Luxembourg 19; France 15; Netherlands 12.
Lead:			
Ore and concentrate	6,639	10	NA.
Oxides	11,154	11,508	Netherlands 5,844; Sweden 950; Pakistan 822.
Metal including alloys:			
Scrap	18,564	16,801	Netherlands 6,656; Italy 5,226; Denmark 2,253.
Unwrought	105,402	106,810	Italy 35,362; France 13,951; United States 10,893.
Semimanufactures	8,006	11,626	Denmark 1,634; Switzerland 1,368; Belgium-Luxembourg 920.
Lithium:			
Ore and concentrate	1,307	NA	
Oxides and hydroxides	625	557	France 169; Italy 126; United Kingdom 92.
Metal, all forms	13	16	Switzerland 10; France 4; India 1.
Magnesium:			
Oxides, hydroxides, peroxides	4,495	NA	
Metal including alloys:			
Scrap	2,572	2,620	Italy 1,311; Netherlands 937; United States 156.
Unwrought	200	179	Austria 115; France 40.
Semimanufactures	330	409	Republic of South Africa 74; France 68; Netherlands 51.
Manganese:			
Ore and concentrate	3,008	2,088	France 715; Netherlands 510; Austria 327.
Oxides	3,961	3,527	Austria 91; France 31.
Metal	100	31	Italy 5; France 2.
Mercury 76-pound flasks	1,694	2,205	Switzerland 325; Egypt 232.
Molybdenum:			
Ore and concentrate	1,174	1,117	Netherlands 321; United States 234; Belgium-Luxembourg 190.
Metal including alloys, all forms	216	237	Japan 7; France 3; Romania 3.
Nickel metal including alloys:			
Scrap	8,025	7,150	Sweden 5,192; Austria 726; United Kingdom 343.
Unwrought	6,815	5,175	France 2,466; Netherlands 964; Finland 496.
Semimanufactures	16,288	8,882	United States 2,094; Belgium-Luxembourg 930; United Kingdom 810.
Platinum-group metals:			
Platinum:			
Ash and waste kilograms	111,359	25,301	Belgium-Luxembourg 25,300.
Scrap and sweepings troy ounces	684	2,726	Spain 1,619; Netherlands 890.
Metal including alloys, all forms do	694,271	706,462	Italy 140,104; Netherlands 98,524; Switzerland 88,044.
Palladium metal including alloys, all forms do	193,892	110,918	Switzerland 37,412; Netherlands 32,174; Brazil 7,964.

Phosphatic do	27	46	Austria 13; United Kingdom 10; Brazil 7.
Potassic do	1,755	2,378	Belgium-Luxembourg 662; India 189; United Kingdom 148.
Other, including mixed do	80	962	Belgium-Luxembourg 196; Austria 107; France 101.
Ammonia, anhydrous do	317	221	Denmark 90; France 38; Belgium-Luxembourg 32.
Fluorspar	10,979	14,789	Austria 7,870; Netherlands 1,881; Yugoslavia 1,358.
Graphite, natural	7,483	7,927	Italy 2,157; United States 1,186; France 1,034.
Gypsum and plasters	334,250	355,983	Netherlands 226,301; Belgium-Luxembourg 38,503; Switzerland 31,785.
Iodine	14	31	France 15; Yugoslavia 4.
Lime	549,427	580,035	Netherlands 494,780; France 36,575; Switzerland 19,680.
Magnesite	11,278	21,693	United Kingdom 6,784; France 4,574; Netherlands 2,872.
Mica:			
Crude, including splittings and waste	753	777	Switzerland 290; Austria 116; Turkey 50.
Worked, including agglomerated splittings	260	427	United Kingdom 103; Yugoslavia 25; United States 16.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Pigments, mineral:			
Natural, crude	2,184	NA	
Iron oxides, processed	144,428	158,898	United States 22,897; France 19,633; United Kingdom 14,732.
Precious and semiprecious stones, except diamond:			
Natural kilograms	258,538	166,716	Switzerland 17,092; Italy 16,809; United States 16,312.
Manufactured do	14,439	19,728	Japan 11,259; Netherlands 2,881; United States 1,805.
Pyrite, gross weight	636	1,361	NA.
Salt thousand tons	2,022	1,935	Belgium-Luxembourg 1,177; Sweden 317; Denmark 105.
Sodium and potassium compounds, n.e.s.:			
Caustic soda do	1,131	1,176	Netherlands 196; Canada 55; United States 46.
Caustic potash and sodic and potassic peroxides do	20	15	NA.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	4,078	3,286	Austria 1,267.
Slate	12,685	11,170	Netherlands 4,006; Belgium-Luxembourg 3,807; Denmark 2,667.
Other	544,661	405,232	Netherlands 298,789; Switzerland 92,474; Italy 3,542.
Worked:			
Slate	1,088	1,616	Belgium-Luxembourg 892; Netherlands 426.
Paving stone and flagstone	23,027	24,284	Denmark 13,000; Belgium-Luxembourg 5,432; Netherlands 4,503.
Other	22,012	22,310	Belgium-Luxembourg 5,816; Austria 5,413; Netherlands 3,399.
Dolomite, chiefly refractory grade	224,989	230,987	France 103,704; Netherlands 89,300; Belgium-Luxembourg 25,812.
Gravel and crushed rock thousand tons	12,341	9,646	Netherlands 7,576; Switzerland 844; Belgium-Luxembourg 718.
Limestone, except dimension	52,456	66,562	Brazil 25,000; Netherlands 23,220; Belgium-Luxembourg 13,596.
Quartz and quartzite	112,302	161,466	Belgium-Luxembourg 85,917; Netherlands 22,952; Austria 13,313.
Sand, excluding metal bearing thousand tons	7,793	8,350	Netherlands 6,858; Belgium-Luxembourg 1,007; Austria 146.
Sulfates, natural: Magnesium sulfate (kieserite)	520,821	536,386	Norway 86,305; Singapore 71,385; France 63,887.
Sulfur:			
Elemental:			
Other than colloidal	341,928	304,693	Netherlands 119,155; Denmark 56,870; Austria 50,245.
Colloidal	2,496	1,568	Republic of South Africa 219; United Kingdom 174; Spain 170.
Sulfur dioxide	12,608	NA	
Sulfuric acid, including oleum	647,073	625,406	Belgium-Luxembourg 148,009; Netherlands 129,405; Spain 69,838.
Talc, steatite, soapstone, pyrophyllite	7,056	7,949	Yugoslavia 2,373; Denmark 1,817; Belgium-Luxembourg 798.
Other:			
Crude:			
Meerschaum, amber, jet kilograms	([1])	NA	
Pottery, broken	29,232	31,184	Netherlands 14,375; Switzerland 4,900; Austria 4,832.
Pozzolana and Santorin earth	15,098	NA	
Vermiculite, perlite, chlorite	1,078	2,767	Belgium-Luxembourg 1,248.
Other thousand tons	1,691	1,657	Netherlands 1,490; France 112; Belgium-Luxembourg 22.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture do	2,878	2,993	Netherlands 2,875; France 69; Belgium-Luxembourg 41.
Slag and ash, n.e.s do	566	715	Netherlands 594; France 83; Switzerland 14.
Oxides and hydroxides of strontium and barium	2,540	2,547	United States 797; France 719; Belgium-Luxembourg 343.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	2,765	1,941	Netherlands 661; Austria 417; Belgium-Luxembourg 340.
Carbon black and gas carbon:			
Carbon black	98,072	94,688	France 22,506; Austria 13,076; Belgium-Luxembourg 12,666.
Gas carbon	95	NA	
Coal and briquets:			
Anthracite and bituminous coal thousand tons	14,287	18,656	France 6,594; Belgium-Luxembourg 4,320; Italy 2,512.
Briquets of anthracite and bituminous coal do	267	382	France 208; Belgium-Luxembourg 99; Austria 31.
Lignite and lignite briquets do	465	509	France 174; Austria 133; Netherlands 71.
Coke and semicoke do	6,283	9,124	Belgium-Luxembourg 2,077; France 1,498; Netherlands 378.
Hydrogen and other rare gases	23,623	23,030	Italy 11,786; France 3,812; Austria 2,505.
Peat, including peat briquets and litter	466,795	494,921	Netherlands 306,463; Switzerland 58,863; France 53,758.
Petroleum:			
Crude 42-gallon barrels	238	224	NA.
Refinery products:			
Gasoline, motor do	3,799	[2]14,467	France 4,756; Netherlands 2,229; United Kingdom 2,112.
Kerosine and white spirit do	9,656	9,238	Ship stores 8,556; Switzerland 404; Netherlands 68; Czechoslovakia 47.
Distillate fuel oil do	7,185	6,204	Ship stores 1,841; France 1,182; Switzerland 883; Denmark 671.
Residual fuel oil do	20,799	20,772	Ship stores 9,158; Austria 3,007; France 1,712; Denmark 1,694.
Lubricants do	3,045	2,953	Belgium-Luxembourg 455; United States 375; United Kingdom 327.
Other:			
Mineral jelly and wax do	1,166	1,234	Ship stores 126; Italy 103; Netherlands 100; Austria 70.
Liquefied petroleum gas do	18,346	71,413	Netherlands 854; Belgium-Luxembourg 628; United Kingdom 554.
Unspecified do	14,812	1,325	Netherlands 587; Belgium-Luxembourg 168; France 129.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons	163,801	NA	

NA Not available.
[1]Less than 1/2 unit.
[2]Includes light oils, etc.

Table 3.—Federal Republic of Germany: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite thousand tons	4,090	3,614	Australia 1,950; Guinea 1,086; Sierra Leone 300.
Alumina	494,918	486,069	Australia 286,011; Italy 131,790; Surinam 31,519.
Aluminum hydroxide	2,099	2,080	United States 1,303; France 350.
Metal including alloys:			
Scrap	128,757	137,345	Netherlands 47,382; Austria 19,474; United States 11,303.
Unwrought	420,511	410,858	Norway 169,377; United Kingdom 43,800; Netherlands 40,539.
Semimanufactures	278,025	204,892	France 57,481; Netherlands 33,702; Belgium-Luxembourg 31,513.
Antimony:			
Ore and concentrate	2,578	3,040	Turkey 800; Chile 516; Republic of South Africa 459.
Metal including alloys, all forms	761	748	Belgium-Luxembourg 383; China, mainland, 200; Spain 40.
Arsenic trioxide, pentoxide acids	619	--	
Beryllium metal including alloys, all forms kilograms	794	815	United States 754.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Bismuth metal including alloys, all forms	160	112	Mexico 19; United Kingdom 14; Belgium-Luxembourg 10.
Cadmium metal including alloys, all forms	988	994	Belgium-Luxembourg 281; Japan 251; Canada 147.
Chromium:			
Chromite	415,593	371,738	Republic of South Africa 244,259; U.S.S.R. 46,593; Iran 23,561.
Oxide and hydroxide	1,243	1,453	U.S.S.R. 1,205; Poland 105; United Kingdom 90.
Metal including alloys, all forms	400	698	Belgium-Luxembourg 257; France 105; Netherlands 100.
Cobalt:			
Oxide and hydroxide	320	603	Belgium-Luxembourg 336; France 84; United Kingdom 82.
Metal including alloys, all forms	2,091	2,059	Zaire 808; Belgium-Luxembourg 605; France 203.
Columbium and tantalum metals including alloys, all forms:			
Columbium kilograms	3,877	10,743	United States 10,219.
Tantalum do	218,979	251,247	United States 187,775; United Kingdom 19,927; Japan 17,911.
Copper:			
Ore and concentrate	576,307	531,355	Papua New Guinea 238,993; Norway 68,430; Chile 66,395.
Matte	6,837	7,561	United Kingdom 2,753; Australia 2,512; Brazil 1,085.
Copper sulfate	8,232	8,575	France 2,781; Belgium-Luxembourg 2,684; U.S.S.R. 1,641.
Metal including alloys:			
Scrap	109,940	137,562	France 41,335; Netherlands 22,900; United Kingdom 17,149.
Unwrought:			
Smelter	118,921	109,225	Chile 43,774; Republic of South Africa 41,099; Zaire 8,060.
Refined:			
Alloyed	47,651	46,399	United Kingdom 11,666; Poland 5,764; Romania 5,423.
Unalloyed	440,276	428,794	Chile 106,818; Poland 72,381; Zambia 52,535.
Master alloys	1,652	1,551	United Kingdom 781; Belgium-Luxembourg 620.
Semimanufactures	156,291	163,940	Belgium-Luxembourg 61,302; France 37,114; Italy 18,892.
Gallium metal including alloys, all forms kilograms	2,700	1,700	Belgium-Luxembourg 600; Canada 400; United States 200.
Gold metal:			
Ash and waste do	45,715	55,310	Switzerland 22,095; Norway 9,844; United Kingdom 6,580.
Scrap and sweepings thousand troy ounces	1,188	816	Switzerland 314; Belgium-Luxembourg 170; Sweden 93.
Unwrought do	3,533	3,600	Switzerland 1,652; U.S.S.R. 1,089; Belgium-Luxembourg 230.
Semimanufactures do	50	61	Republic of South Africa 16; Switzerland 15; France 12.
Hafnium metal including alloys, all forms kilograms	40	20	NA.
Iron and steel:			
Ore and concentrate thousand tons	39,749	42,133	Brazil 11,132; Liberia 7,045; Sweden 5,727.
Roasted pyrite do	822	533	Spain 290; Belgium-Luxembourg 154; Portugal 43.
Metal:			
Scrap do	1,423	1,548	Netherlands 671; United Kingdom 218; Belgium-Luxembourg 212.
Pig iron, including cast iron do	311	293	Brazil 112; Canada 57; Norway 19.
Sponge iron, powder, shot do	38	45	France 18; Sweden 14; United Kingdom 6.
Spiegeleisen	41	37	NA.
Ferroalloys:			
Ferrochrome thousand tons	129	194	Republic of South Africa 104; Sweden 38; Finland 18.
Ferromanganese do	158	160	Norway 54; France 45; Spain 17.
Ferronickel do	39	61	Greece 49; New Caledonia 6; Dominican Republic 4.
Ferrosilicon do	141	159	Norway 68; France 40; Spain 16.
Ferrosilicochrome do	19	6	Sweden 3.
Ferrosilicomanganese do	69	101	Norway 48; Czechoslovakia 16; Spain 14.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—In November 1978, Gebrüder Giulini GmbH applied for bankruptcy. The company's 48,000-ton-per-year Ludwigshafen reduction plant was to remain temporarily in operation for the next 6 months, while the State of Rheinland-Pfalz provided $500,000 to keep the plant operating. In 1979 the Aluminium Co. of Canada Ltd. (ALCAN) purchased the company for $12.2 million.

The Federal Republic of Germany smelter output was near capacity in 1979, unchanged in comparison with that of the previous year. The Federal Republic of Germany's aluminum reduction plant capacity remainded about 762,000 tons per year in 10 plants operated by 6 companies. Four of these same companies controlled five alumina plants with a total capacity of 1,730,000 tons per year. Some alumina and all the bauxite used in the country's aluminum industry was imported.

Chromium.—Thyssen Edelstahlwerke AG, the special steel subsidiary of Thyssen AG, called on the Federal Republic of Germany Government to finance a stockpile of chrome, equivalent to the country's 2-year consumption, to guard against a possible short fall in supplies from South Africa.

Iron Ore.—The Federal Republic of Germany was, in 1978, the world's second largest importer of iron ore, with imports of about 45 million tons, or 94% of the iron ores used. In 1977, the Federal Republic of Germany's major iron ore suppliers were Brazil (26%), Liberia (17%), Australia (13%), Sweden (12%), and Canada (11%). In 1979, the situation was basically unchanged. Decline of the Federal Republic of Germany's domestic iron ore production continued during the period. Four domestic companies operated six iron ore mines. Average iron content of the Federal Republic of Germany iron ore output was less than 30%. In the 1980's, the Federal Republic of Germany plans to increase its overseas iron ore imports to about 55 million tons per year, an increase of about 10 million tons. Cooperative ventures concluded with Liberia and Brazil have helped to secure present supply, and it is expected that to secure future supplies, about $600 to $700 million will have to be invested in similar foreign ventures.

Iron and Steel.—About 100,000 workers out of a total work force of 208,000 in the Federal Republic of Germany's steel industry went on strike or were locked out of their jobs for 45 days beginning November 28, 1978. Affected were 19 steel plants in the Ruhr area and in the cities of Bremen and Osnabrück. In particular the following companies and plants were struck: Thyssen AG; Hochofenwerk Hamborn, Werk Beeckerwerth, head office in Düsseldorf, and Werk Meiderich; Mannesmann Hüttenwerke, Duisburg; Hoesch Hüttenwerke AG, Westfalenhütte; Friedrich Krupp Hüttenwerke AG Düsseldorf-Bernrath; Stahlwerke Krupp-Südwestfalen; and Mannesmann Röhrenwerke AG, Brakwede. Following the strike, a new contract was concluded according to which there was a 4% increase in wages retroactive to November 1, 1978; the present average wage is $11,300 per year. By 1982, annual leave is to increase to 6 weeks. The 40-hour week was maintained, but was reduced effectively by time off to 38 hours, and night shift workers and those over 50 have an extra day off. The strike, the first in the industry in 50 years, cost about $820 million in revenue according to management.

United States Steel sold its share of the Metallhüttenwerke Lübeck GmbH, a large coke and steel producer in the Lübeck area.

Modernization continued in the steel industry in spite of generally poor business conditions and operation at less than 70% capacity.

Demag AG was building two 140-ton oxygen converter installations for a new steel mill of Stahlwerke Röchling-Burbach Völklingen, an Acieries Réunies de Burbach-Eich-Dudelange, S.A. (ARBED, S.A.), Luxembourg subsidiary, in the Saar. The plant is to replace present converter and reverberatory steelmaking facilities at the rate of 1.6 million tons per year.

Friedrich Krupp Hüttenwerke AG acquired from Stahlwerke Röchling-Burbach, a 58.17% stake in the Saar-based drop forging concern, Gerlach-Werke GmbH.

The Steel Commission of the European Communities approved the takover by Hoesch AG of the Siegener AG, a German producer of coated sheet, boosting the group's capacity of coated flat products from about 300,000 tons to 700,000 tons per year.

Mannesmann AG has earmarked $370

million for its new investment program, three-quarters of which was to be expended domestically. Emphasis was on expansion of the pipe manufacturing plants producing oil industry piping and the construction of a new $100 million blast furnace for the Duisburg-Huckingen steel mill, to replace two older units. About 15% of the funds was to be used for environmental purposes.

The Neukirchner Eisenwerk AG has a new contract with ARBED, Luxembourg, who will supply the company with minette iron ore from its Ferdinand Mine, located in France, across the German-French border.

Thyssen AG announced extensive investment plans for modernizing its plants. In addition to about $250 million left over from existing programs, $445 was earmarked for new projects. New plants included a slab caster at Beeckerwerth, near Duisburg, brought up to capacity and a new electric-arc shop at Oberhausen, near Duisburg and commissioned in the fall of 1979. Plans were prepared to expand hot strip mills; to add a fifth cold rolling stand at Beeckerwerth; and to create new rolling mills for wide strip at the same location.

Cutbacks in uncompetitive divisions included an old rolling mill at Thyssen Niederrhein's Duisburg works; a section mill at the Ruhrort works near Duisburg; and closing of the open hearth shop at Oberhausen during 1979.

Thyssen Edelstahlwerke AG of Düsseldorf received a loan of about $5.5 million from the European Communities to help finance antipollution installatins at No. 3 arc furnace shop at its Krefeld works in the Ruhr.

Although outlook was improving for the steel industry, pickup was only slow and steelmaking capacity was virtually unchanged. Mills were running at about 67% of capacity. Steelmaking capacities of major steel producers are shown in the following tabulation.

Company	Approximate steelmaking capacity in million tons per year
August Thyssen-Hütte	16.5
Hoesch AG	7.2
Klöckner Werke AG	7.2
Peine-Salzgitter AG	6.3
Friedrich Krupp GmbH	4.5
Mannesmann AG	4.5
Stahlwerke Röchling-Burbach AG	2.8
AG der Dillinger Hüttenwerke	2.0
Neunkircher Eisenwerk AG	1.3

At least 48 companies produced stainless and alloy steel, with deliveries totaling about 568,000 tons. The most important producers representing approximately 60% of the Federal Republic of Germany's output, were as follows:

Edelstahlwerke Buderus AG	Lahn
Klöckner Werke AG, Georgsmarienhütte	Osnabrück
Friedrich Krupp Hüttenwerke AG	Bochum
Stahlwerke Röchling Burbach GmbH (ARBED) Völklingen	Saar
Stahlwerke Südwestfalen AG	Siegen
Thyssen Edelstahlwerke AG	Krefeld

Lead, Zinc, and Copper.—In 1978, Preussag-Boliden-Blei GmbH closed down its Harz, Lower Saxony, lead smelter temporarily because of a shortage of lead concentrates due to strikes at suppliers in Peru and elsewhere. Usually 40% of the concentrates is supplied by Boliden while the rest is acquired by Preussag from various foreign sources, including Canada as the most important.

Under terms of an agreement reached between Metallgesellschaft AG and its Lurgi subsidiaries on the one hand and the Ministry for the Metallurgical Industry of China on the other, Metallgesellschaft will receive substantial quantities of ore, nonferrous concentrates, and metals from China over the next 15 years. In return, the Lurgi companies are to establish, over the course of several years, 22 plants for major nonferrous metals in various Chinese provinces. The joint development programs include opening of ore deposits and construction of metallurgical plants.

The Rio Tinto Zinc Co. reached an agreement during the year to buy the Duisburger Kupferhütten AG, an unprofitable enterprise, at the nominal price of Dm 1 from the German chemical companies BASF, Bayer, and Hoechst, each holding 31.4%, Gebrüder Giulini (4.4%); and Henkel (1.3%).

In 1979, the Federal Republic of Germany had three lead-zinc mines serviced by four concentrators. Preussag AG mined about 55% of the country's lead-zinc ores in the Harz region; and Sachtleben Bergbau GmbH produced about 45% at Lennestadt in North Rhine Westphalia. The Luderich Mine of AG des Altenbergs für Bergbau und Zinkhüttenbetrieb in the Cologne region was closed in 1978, because the development of a new deposit was prevented at the mine by a citizen's protest. Some copper concentrate was also produced in the lead-zinc mines.

The Federal Republic of Germany smelter and refinery capacity in the same year was approximately as follows: lead 395,000 tons per year, zinc 435,000 tons per year, and copper 260,000 tons per year. The country's principal operators were Berzelius Metallhütten GmbH's Imperial Smelter (annual capacity: 35,000 tons of lead and 80,000 tons of zinc) at Duisburg Wanheim; Duisburger Kupferhütte GmbH's electrothermic zinc smelter (20,000 tons per year) and electrolytic copper refinery (30,000 tons per year), both at Duisburg; Preussag AG's Harlingerode vertical retort zinc smelter (95,000 tons per year), Nordenham electrolytic zinc refinery (110,000 tons per year) and lead smelter (120,000 tons per year), and Oker lead smelter (45,000 tons per year); Ruhr Zinc GmbH's Datteln electrolytic zinc plant (130,000 tons per year), Norddeutsche Affinerie's Hamburg lead smelter (45,000 tons per year), and Hüttenwerke Kayser AG's Lünen electrolytic copper refinery (15,000 tons per year).

Rare-Earth Metals.—Th. Goldschmidt AG, the country's leading rare earth materials processor prepared mainly about 200 tons of samarium cobalt alloys for permanent magnets in Essen; Treibacher Chemische Werke AG produced mainly cerium-based polishing compounds in Treibach, both from imported materials.

Silver.—Two Federal Republic of Germany companies, Preussag-Boliden-Blei GmbH, a subsidiary of Preussag AG, and Berzelius Metallhütten GmbH, produced about 7 million troy ounces of silver at their lead refineries at Nordenham and Duisburg-Wanheim, respectively.

Tantalum.—The Gesellschaft für Electrometallurgie GmbH in Nuremberg produced some tantalum and potassium tantalum fluoride from tin slags it imported mainly from Malaysia and Thailand. The slags contained about 12% tantalum metal.

Titanium.—In 1978, West German titanium dioxide plant locations, and processes were: Bayer AG operated at Uerdingen, near Kreefeld in the Ruhr, a 75,000-ton-per-year sulfate and a 20,000-ton-per-year chloride process plant; Kronos Titan GmbH, a subsidiary of N.L. Industries Inc., United States, operated an 80,000-ton-per-year sulfate process plant and a 40,000-ton-per-year chloride process plant at Leverkusen near Cologne and a 60,000-ton-per-year sulfate process plant at Nordenham near Wilhelmshaven; and Sachtleben Chemie, a subsidiary of Metallgesellschaft AG, operated a 55,000-ton-per-year sulfate process plant at Homberg-Duisburg in the Ruhr, North Rhine Westphalia.

Metallgesellschaft AG of Frankfurt is considering building a 2,000 to 3,000-ton-per-year titanium metal smelter, since the U.S.S.R. has ceased to export titanium metal.

NONMETALS

Ammonia.—The Badische Anilin und Sodafabrik AG has decided to build an ammonia plant at Ludwigshafen on the Rhein, to cost about $100 million. Capacity is to be 370,000 tons of nitrogen, bringing the company's capacity at this location to almost 1 million tons in 1982.

Barite.—In 1978, the Federal Republic of Germany was a net importer of barites, importing nearly half of its requirements. Although the Federal Republic of Germany had been Europe's largest producer and exporter in 1968, by 1978 the German industry had declined, and it had become more economical to import barite than to operate the higher cost mines. Only six barite mines remained in operation in the country. Deutsche Baryt Industrie Dr. Alberti Co. and Sachtleben Bergbau GmbH controlled two each; Feldhaus Schwerspatgrube GmbH and Preussag AG Metall controlled one each. All mines were located in the Harz Mountains.

Kaolin.—Capacity of major West German kaolin producers was: Amberger Kaolinwerke, Hirschau, Bavaria, 135,000 tons per year; Gebrüder Dorfner GmbH, Scharhof, Bavaria, 100,000 tons per year; Eduard Kick, Schnaittenbach, Bavaria, 110,000 tons per year; and Erbslöh & Co. Geisenheimer Kaolinwerke, Lohrheim-Oberwinter, Northern Rheinland-Pfalz, 80,000 tons per year. There were also four smaller producers of kaolin in the Federal Republic of Germany.

Potash.—Higher demand in foreign markets led to a production increase of about 10%, to about 2.5 million tons of K_2O in 1978; nevertheless domestic sales declined slightly. Potash companies could also increase their salt production because of demand boosted by severe winter conditions. In 1979 potash demand increased again.

About 91% of West German potash output was produced by the nine potash mines of Kali und Salz AG; eight of these were Bergmannssegen-Hugo, Hattorf, Neuhof-Ellers, Niedersachsen-Riedel, Salzdetfurth, Siegfried-Giesen, Sigmundshall, and Wintershall. Kali und Salz's small ninth mine, Hope, is expected to be depleted by 1980, and its production personnel were combined with those of the Sigmundshall Mine by Kali und Salz. The second largest West German potash company, Kali Chemie AG, accounted for the remaining 9% of the country's potash production at its Friederichshall Mine near Hannover. The Federal Republic of Germany's potash mines were also located in the Hannover area except for Wintershall and Hattorf, which were east of Kassel on the German Democratic Republic border, and Neuhof-Ellers, which was near Fulda.

MINERAL FUELS

Domestic coal, lignite, natural gas, and crude oil supplied only about 36% of the Federal Republic of Germany's energy. Roughly one-half of the country's energy needs were met by oil imports in 1978. In 1979 the pattern was not much changed. The principal objective of German energy policy is to reduce dependence on imported oil. In 1979, energy consumption grew by 5.9%.

Coal and Lignite.—In 1978, coal production continued to decrease slightly, while lignite production gained somewhat. The still abnormally large stock of coal and coke decreased slightly to 24 million tons. In 1979, production increased about 2.5%, but large deliveries caused stocks to decrease to 18 million tons.

On January 1, 1979, the Government raised coal subsidies paid by consumers of electric power from an average of 4.5% to an average of 6.2% of the electric bills, with actual increased rates varying in each State.

West German Government participations in fuels and power industry were: coal 50%, crude oil production 25%, natural gas 50%, and electric power 75%.

In October 1978, Rheinische Barunkohlenwerke AG (Rheinbraun) started operations at its new Hambach opencast lignite mine in the vicinity of Düren in the Cologne-Aachen Basin. Reserves of 2.4 billion tons are to last for 60 years. In a first phase, to extend until 1983, 600 million cubic meters of overburden are to be stripped, before the first lignite is produced from 20- to 70-meter -thick deposits lying at depths of 200 to 470 meters. At first three 240,000-cubic-meter-per-day excavators will be used, later to be increased to eight to produce 50 million tons of lignite per year.

During 1978, Ruhrkohle AG constructed a 10-kilometer, 6,100-kilowatt underground conveyor belt between the lignite mines of Pattberg and Rossenray on one hand and Rheinpreussen on the other hand. This will enable the company to complement the producing and processing capacities of the mines for the production of 15 million tons of raw lignite and 7.5 million tons of salable product per year.

The Federal Republic of Germany had 40 coal and 17 lignite mines, 21 coking plants, five briquetting plants, and 29 mine mouth powerplants. The bituminous coal industry was controlled mainly by seven companies: three in the Ruhr, two in the Aachen area, and one each in Saarland and Lower Saxony. The largest industrial group was the Ruhrkohle AG, controlling about three-quarters of the country's bituminous coal output.

The lignite industry was dominated by the Rheinische Braunkohlenwerke AG, which accounted for nearly four-fifths of total output; the remaining production came from two medium-sized and four smaller companies.

The Federal Republic of Germany's bituminous coal reserves were estimated in 1974 at 44 billion tons, of which 30 billion tons were recoverable. Total resources were placed at 230.3 billion tons. the Federal Republic of Germany's known lignite reserves were put at 55.5 billion tons, of which 9.5 billion tons were recoverable reserves. Total resources were estimated at 55.9 billion tons.[4]

Nuclear Power.—The Federal Republic of Germany's 15 operating nuclear powerplants generated about 36 million megawatt hours in 1978 and 42 million megawatt hours in 1979. Two nuclear powerplants were inoperative during the year, and two others were still in their commissioning phase, although one of the two went critical during 1978.

The Government of the Federal Republic and Lower Saxony have signed an agreement on financing the construction and operation of a spent nuclear fuel reprocessing and waste disposal center at Gorleben in Lower Saxony, near the border of the German Democratic Republic. According to the present schedule, the center will start full operation only in the late 1980s or early 1990s. At present, the Federal Republic of Germany has only limited nuclear waste storage facilities.

The members of URENCO, a uranium processing consortium composed of the Netherlands, Great Britain, and the Federal Republic of Germany, have approved plans to erect the Federal Republic of Germany's first uranium enrichment plant (centrifuge) at Gronau, near the Dutch city of Almelo. Saarberg Interplan AG, a wholly owned subsidiary of Government-owned Saarbergwerke AG, with uranium operation at Menzenschwald (southern Black Forest) and Gernsbach (northern Black Forest) disclosed that it had 4,000 tons of economically recoverable reserves of uranium, but exploitation of the deposits was nevertheless postponed indefinitely.

Esso Erz GmbH, a wholly owned subsidiary of Esso AG, has disclosed the discovery of uranium deposits in Bavaria, the Black Forest, Hesse, and southern North Rhine Westphalia, some of which it hopes to exploit some time in the future. The company has expended about $10 million during the last 4 years to prospect its uranium concessions.

Kraftwerk Union (KWU), a wholly owned Siemens subsidiary, was the Federal Republic of Germany's leading power station building company. KWU had two nuclear powerplants under construction near Buhsir in Iran, one completed and one underway in Argentina, and eight plants on order in Brazil, four of which were under a firm order.

Petroleum and Natural Gas.—The year 1979 brought lower domestic production of crude oil, higher output of natural gas, and substantially increased imports of crude oil and petroleum products. the Federal Republic of Germany remained West Europe's largest petroleum importer.

BP offered $414 million for a 25% share of Government-controlled VEBA AG, the country's major oil company. The Federal Cartel Office objected to the proposal out of concern for the possible domination of Ruhrgas, a VEBA subsidiary, by the major international oil companies. Ruhrgas is the Federal Republic of Germany's major national gas company. The European Communities also objected to the deal on grounds of a conflict of interest, namely that BP, a leading world supplier of natural gas, would find itself part owner of a process extracting a direct competing fuel (synthetic gas) from Germany's coal reserves. In 1979 the deal was finally concluded.

The Federal Republic of Germany's strategic petroleum reserve law went into effect in 1978. The law creates a quasi-public corporation called Erdölbevorratungsverband (EBV), or Oil Stockpiling Association, to take over stocks from the oil industry equivalent to 65 days' consumption. Companies will be required to hold only 25 days' stocks instead of 90 days as in the past. The industry is contributing to the cost of EBV's maintenance and is to pass on the cost of 0.5 to 1 pfennig per liter to the public.

The German Government approved a contract between a group consisting of Ruhrgas AG and Salzgitter AG on the one hand and Algeria on the other for the import of 4 billion cubic meters per year of natural gas from Algeria to Germany.

Wintershall-Deutsche Texaco has completed a fourth offshore well in the Bay of Eckernförde in the Baltic Sea. There are already several other producing oil wells in the area.

A consortium led by Union Texas Germany Inc., a subsidiary of Mobil Oil Deutschland AG, abandoned as uneconomical offshore well, J13-2, 100 kilometers north of Emden at a depth of 4,800 meters. Onshore, Mobil Oil AG was planning a 5,000-meter exploratory well for natural gas 50 kilometers north of Hannover.

By midyear 10 companies controlled the Federal Republic of Germany's 26 onshore drilling rigs.

Offshore drilling was started at the Dansk Nordsö Tove 1 well located on the border between the West German and Danish zones of the North Sea, 25 kilometers south of the Danish Dan Field. The German Offshore Consortium and the Danish Offshore Consortium participated equally in this venture, with Maersk Oel und Gas GmbH as operators.

The country had three new pipelines in various stages of development. MEGAL GmbH's 165-kilometer, 32-inch crude line from Oberkappel to Schwandorf (completion in 1979); Gasversorgung Süddeutschland's 26-kilometer, 12-inch pipeline from Rottweil to Konstanz (completed); Esso-British Petroleum pipeline from Wilhelmshaven to Hamburg (planned).

The Oberrheinische Mineralölwerke (OMW) completed the 2.4-million-ton-per-year expansion of its Karlsruhe refinery on the Rhein by the construction of Europe's largest and most modern cracking unit.

Continental Oil Co.'s share in the company was increased by this expansion from 10% to 25%; the shares of Deutsche Texaco and VEBA Chemie have decreased from 45% to 42% and from 45% to 33%, respectively.

In 1978, the Federal Republic of Germany's 21 oil companies controlled 32 oil refineries with a total capacity (throughput) of 159.4 million tons per year.[5]

The Mineral Industry of Ghana

By Janice L. W. Jolly[1]

The mineral industry of Ghana, like much of the nation's industry in 1978 and 1979, suffered from the general effects of rampant inflation and from shortages of foreign exchange, imported spare parts and materials, and petroleum supplies. The annual rate of inflation was estimated to have fallen from 104% in June 1978 to 79% in June 1979. Ghana was debt-ridden and was fighting to prevent an international declaration of Ghanaian bankruptcy. The country's external debt was over $1 billion[2]. Most firms that depended on foreign sources for raw materials were operating at only 20% to 30% of their capacity by early 1979. The Ghana Industrial Holding Corp. (GIHOC) closed down 9 out of 16 production divisions, including the metal industries and marble works, as a result of raw materials shortages. Banks were unable to establish letters of credit for the corporation, and the Government was unwilling to provide it with adequate import licenses.[3] Ghana experienced a 10% drop in its gross national product (GNP) between 1974 and 1978, measured in real terms. The per capita GNP declined by 18.8% and was compounded by an annual population increase of around 3%.

In a coup on June 4, 1979, the Armed Forces Revolutionary Council (AFRC) took over the Government and instituted corrective measures that were intended to put the country on a recovery path. The AFRC ordered the declaration and examination of the assets of all officers of state corporations and enterprises, and a committee was set up to review all building, civil, and engineering contracts established by the Government since 1970. Price controls were also introduced, but their immediate effect was to increase consumption, which contributed to further shortages. The mood of uncertainty following the coup and an accompanying purge was reflected abroad as well as among local entrepreneurs. Lines of credit and loans agreed upon before the coup were going ahead, but neither foreign governments nor the private sector were showing an inclination to invest in the future. Ghana's first general elections in a decade were held 2 weeks after the coup, and the civilian Government took control on October 1, 1979.

Several loans and grants were organized during 1978 and early 1979 to aid Ghana's industry and development. Six countries had agreed to contribute about $630 million for the Opon Mansi steel development project in the Western Region. Of the total $1,460 million in investments that this project represents, the Federal Republic of Germany, Japan, and Brazil reportedly contributed $200 million, $250 million and $180 million, respectively; and Poland, the Netherlands, and India were also expected to make contributions in unspecified amounts. The Canadian International Development Agency (CIDA) allotted $2.8 million for two major development projects in the Northern and Upper Regions. The Bank for Housing and Construction was expected to receive a $15 million long-term loan from the Central Bank of Brazil to set up building materials industries that would include facilities for the manufacture of cement and iron rods. The World Bank and the European Economic Community (EEC) granted the Ghana National Investment Bank a total credit facility of $25 million ($19 million from the World Bank, $6 million from the EEC) in July 1979 for use in acquiring spare parts and essential raw materials. Ghana and West Germany signed a loan agreement for $8.3 million to meet Ghana's urgent foreign exchange requirements for 11 institutions, including the GIHOC and Saltpond Ceramics. West Germany also granted Ghana $65 million for electricity development and transportation facilities on the Volta Lake. The United Nations Development Programme's (UNDP) resources for Ghana were increased from $15 million for the first country program (1972-76) to $19 million for the second program (1977-81). UNDP resources available for the 1979-81 period totaled $10.75 million, including $3.5 million for mining. A major share was designated for the improvement of gold and diamond output and for building up Ghana's capacity to train its own mining technicians. About $907,000 was designated for mining engineer training, $532,000 for operational assistance to the state Gold Mining Corp. (GMC), and about $188,000 for diamond prospecting on the Birim River. In early 1979, Ghana's mining companies were also benefiting from a new British line of credit worth $20 million that was intended to be used partly for machinery and spares. The Standard Chartered Merchant Bank of London also negotiated a development loan to Ghana for $19 million.

It is expected that power for future mining projects will be required in far greater quantities than is currently available. A major hydroelectric scheme was under construction at Kpong, downstream from the Akosombo Dam. However, there were long delays in the arrival of equipment necessary for construction of the station, and completion was not expected for several years. The Volta River Authority (VRA) and Sadelmi Cogepi of Italy signed a $7 million contract for mechanical and electrical services for the Kpong hydroelectric project in early 1979. CIDA was planning to assist in the relocation of 7,000 people displaced by the Kpong project. In December 1978, VRA and the Ivory Coast Electricity company signed a protocol agreement for the interconnection of the electrical networks of the two countries. Plans were for the project to be financed by the African Development Bank (ADB), the European Investment Bank (EIB), Ghana, and the Ivory Coast. Water supply was also a problem in early 1979; it was interrupted by a major blockage in the Kpong-Tem-Accra main water pipeline, which supplied 80% of Accra's water. The cement lining was crumbling all along the pipe. All industries, including the aluminum and refined petroleum industries, were dependent upon a sufficient supply of water.

PRODUCTION AND TRADE

Ghana's mineral production was valued at $238 million for 1978, including production of aluminum from imported alumina. Gold production fell during 1978, compared with that of 1977 and sales were $26.4 million in 1978, compared with $32 million in 1977. Gold revenues received were much higher in 1979 (nearly $300 million) because of the rise in gold prices on the international market. Bauxite production increased while world prices remained generally stable, with a slight upward trend. Total bauxite sales for the year ending in March 1978 were about $2.9 million. During this same period, Ghana Consolidated Diamonds Ltd. (GCDL) produced revenues of $14.8 million from the sale of diamonds. Although diamond output was down, this was generally offset by higher prices for both 1978 and 1979. Manganese production improved, and the Ghana National Manganese Corp. (GNMC) continued to pursue a proposed nodulization plant project that was expected to make the company more viable when the oxide ores phase out. Manganese was shipped from the port of Takoradi for export to nine countries: the United Kingdom, Japan, Belgium-Luxembourg, Spain, Ireland, the German Democratic Republic, Norway, the Netherlands, and Portugal.

The decision to float Ghana's currency, the new cedi, on July 19, 1978, was accompanied by a new set of economic measures that included suspension of Special Unnumbered Import Licenses (SUL's), which were introduced in 1976 to improve the supply of imported commodities. Under SUL's, importers who had their own foreign exchange were allowed to operate outside the import program for bringing goods into the country. In practice, however, the system was increasingly abused by currency speculators. The 1978-79 budget was designed to try to curb imports of nonessential consumer goods, and the import bill was to be restricted to the 1977 level while a system of import license priorities was established. The priority sectors, raw materials and spare parts, were supposed to receive their allocations, but foreign exchange was tight. A government decree (Export Bonus Amendment Decree, SMCD 134) was also enacted, effective July 1, 1978, to credit gold producers with an additional 20% of the revenue from exported gold bullion.

Oil imports continued to be a problem. Ghana's oil import bill accounted for 30% of the country's total imports in 1978 and amounted to almost $300 million. Nigeria had supplied 80% of Ghana's crude oil requirements, but by June 1979, the Nigerian Government ceased petroleum shipments to the Tema refinery, objecting to persecution during the Ghanaian Government coup. In an effort to obtain crude oil from other sources, Ghana negotiated with Algeria for crude petroleum supplies. Although deliveries from Nigeria were renewed by October, 1979, Ghana endured severe shortages of essential gasoline throughout the country for the remainder of the year. Ghana began crude petroleum production from the Saltpond field in mid-October 1978.

Table 1.—Ghana: Production of mineral commodities

Commodity[1] and unit of measure	1976	1977	1978[p]	1979[e]
Aluminum:				
Bauxite, gross weight ---- metric tons--	271,563	244,217	328,087	300,000
Metal, smelter, primary ------do----	151,391	153,468	111,364	[2]168,727
Cement ------- thousand metric tons--	[e]650	610	500	400
Diamond:				
Gem ----------- thousand carats--	228	230	142	150
Industrial ---------------do----	2,055	[e]1,717	1,281	1,350
Total---------------do----	2,283	1,947	1,423	1,500
Gold --------- thousand troy ounces--	532	481	402	482
Iron and steel: Crude steel --- metric tons--	15,000	15,000	10,000	5,000
Manganese ore and concentrate, gross weight do----	311,872	291,585	315,577	272,160
Petroleum refinery products:				
Gasoline -- thousand 42-gallon barrels--	1,890	1,928	2,231	2,200
Jet fuel---------------do----	385	392	309	300
Kerosine---------------do----	732	747	1,046	1,000
Distillate fuel oil ----------do----	2,482	2,531	2,455	2,400
Residual fuel oil ----------do----	2,440	2,589	2,080	2,000
Other---------------do----	98	92	137	130
Refinery fuel and losses-------do----	466	384	393	390
Total---------------do----	8,493	8,663	8,651	8,420
Salt[e] --------------- metric tons--	52,000	50,000	50,000	50,000
Silver, mine output, metal content thousand troy ounces--	NA	NA	19	20

[e]Estimate. [p]Preliminary. NA Not available.
[1]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone) is produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.
[2]Reported figure.

COMMODITY REVIEW

METALS

Aluminum.—The joint venture between Ghana Bauxite Co. and the Government was extended for another 5 years. No new developments were reported in the much-postponed Nyinahin and Kibi bauxite mining projects. Aluminum production by the Volta Aluminum Co. (VALCO) was severely disrupted by a massive power failure that brought production to a complete halt in the second quarter of 1978. By yearend, four of VALCO's five potlines were back in operation, but total production for 1978 was down by about 27% from that of 1977. Hundreds of workers in the industry were laidoff as a result of the shutdown. A $10 million aluminum rolling mill was planned by the Ghana Aluminum Industries Commission, The Ghana Social Security Bank, and the National Investment Bank for Tema. Hunter Engineering SPA of Italy was expected to supply equipment and personnel and was awarded a 2-year management contract. Hunter was also providing a loan for the equipment. It was planned that aluminum ingots for the mill would be obtained from VALCO.

Columbium-Tantalum.—A prospecting license for columbium-tantalum was granted by the Government to Amalgamated Mining Co. (Ghana) Ltd. (AMC) on November 12, 1976, and the rights were extended on September 1, 1977, until November 11, 1978. On August 21, 1978, AMC entered into an agreement with Columbite Exploration and Development Co. (Ghana) Ltd. (CEDCo) to prospect for columbite. The West German firm Gesellschaft fur Elektrometallurgie GmbH was a 49% shareholder of CEDCo; and AMC, made up mainly of Ghanaians, held 51% of the shares. CEDCo started initial exploration activities in 1979.

Gold.—Total gold production in 1978 declined sharply from that of 1977. The decrease in production resulted largely from a cutback at Ashanti Gold Fields Corp. mine. Ashanti was sinking a new subvertical shaft that was expected to permit extraction of an additional 75,000 tons of ore over the next 10 years. Completion of the shaft was expected by 1981. Continued improvements to the mill circuit resulted in an improvement in gold recovery to 83.5%. From 1912 to the end of March 1978, the Ashanti mine had crushed a total of 20.9 million tons of ore, yielding 16.2 million fine ounces of gold. The company's property covered an area of 259 square kilometers in the Bekwai and Obuasi districts of the Ashanti Region. Ashanti's ore reserves were reported at approximately 4 million metric tons with an average grade of 0.75 troy ounces per ton.

The GMC mine at Dunkwa (Dunkwa Goldfield Ltd.) produced 154,914 ounces in 1978. Ore reserves at Dunkwa totaled 265 million cubic meters at the end of March 1978. Dunkwa was the only gold concession where gold was being recovered from river gravels by dredge. The company's dredging concessions extend on either side of the Ofin River some 58 kilometers upstream to the Jimi River, and north to the Ashanti concession boundary. From 1912 to March 31, 1978, the company treated a total of 202 million cubic meters of gravel, yielding 1.4 million fine ounces of gold.

The GMC mine at Tarkwa (Tarkwa Goldfields Ltd.) produced approximately 3.9 million fine ounces of gold between 1912 and March 1978. Tarkwa produced 56,356 ounces in 1978. Ore reserves at January 1, 1976 were estimated to be 133,177 metric tons averaging 1.4 ounces per ton.

The GMC mines at Prestea, (Prestea Goldfields Ltd.), Bondaye, and Tuappim, had combined ore reserves of approximately 1.3 million tons with an average grade of 0.34 ounces per ton. Prestea Goldfields Ltd. comprised the former Prestea Goldfields and the Ghana Main Reef and Ankobra River Power Companies and was first registered in 1929. From 1912 to March 1978, about 5.6 million ounces of gold were produced from 291,395 tons of ore.

The GMC mine at Konongo (Konongo Goldfields Ltd.) had available ore reserves of approximately 17,684 tons with an average grade of 0.26 ounces per ton over a distance of 10.5 meters at the end of March 1977. Decreased production for 1978 (5,286 ounces) was the result of very poor grade ore. Between 1912 and March 1978, a total of 3 million tons of ore had been crushed to yield 1.4 million ounces of gold. The total concession area was about 52 square kilometers including Attunsu, Boabedroo, Occomadesia, and Odumasi. All Konongo ore was shipped by rail to the Tarkwa mill for custom treatment.

Iron and Steel.—Construction continued on the iron and steel smelter complex between Takorandi and Sekondi. It was anticipated that about 1 million tons of ore per year would be mined at the Opon-Mansi iron ore deposit to feed the new complex. Charcoal for smelting was expected to be supplied from Daboase at the rate of 100,000 tons per year. Limestone for flux was expected to be supplied from the Nauli deposits. The Opon-Mansi iron ore deposit was being developed by the Integrated Iron and Steel Commission (ITSC). The Opon-Mansi deposit is mainly a lateritic capping with low silica and phosphorous contents (3% and 1%, respectively). Its average iron content is 41%; and its average alumina content is 14% . Reserves were estimated at 150 million tons. Because of a lack of funds needed for the purchase of high-voltage transformers, completion of the plant was delayed past the expected April 1978 completion date, and large quantities of chemicals that were imported for use in the new foundary were reported to be unusuable in 1979. In June 1979, the National Bank granted ITSC $500,000 to pay for imports of equipment needed for the plant.

Manganese.— GNMC contracted Fuller Corp. to upgrade the carbonate reserves at Nsuta. The plant, which was expected to cost approximately $18 million to design and equip, was due for completion in 1980 and was expected to allow production to remain at present levels. The nodulizing process to be used at Nsuta involves crushing the manganese carbonate ore and heating it in a rotary kiln to drive off the carbon dioxide. Additional heating allows the material to soften and form spherical nodules about 1 inch in diameter. The kiln was designed to be 16.5 feet in diameter and 375 feet long. The plant's projected capacity was 1,100 tons per day of manganese concentrate. The country's oxide reserves were almost exhausted, and the evaluation of other commercial-grade ores—carbonates in particular—continued. Several manganese deposits were under investigation at Yakau, near Dixcove, Western Region. Five main deposits were mined at Yakau prior to 1952, and the recovered manganese was shipped to Europe. The deposits had a 42% manganese content in 1952, and it was considered likely that a considerable amount of ore (5.5 million tons) can still be found here. The manganiferous zone near Ntereso and Branfo, Northern Region was also considered to have potential, with ore reserves estimated at 2.5 million tons containing 30% to 45% manganese.[4]

Uranium.—Desmond Co. of Canada was assessing uranium deposits in eastern Ghana. It was reported that the Ghanaian Government was spending $380,000 for prospecting for uranium and other minerals in the region.

NONMETALS

Clays.—Saltpond Ceramics Ltd. was exploiting the kaolin deposit at the Abandze-Saltpond bypass, in the Central Region for use in the production of toilet bowls, sinks, plates, and crockery. The kaolin deposits of this area are closely associated with the pegmatites that occur along the coast from Saltpond to Biriwa and are derived from them. Kaolin deposits also occur in association with the bauxite deposits of the Atewa Range, about 10 kilometers northeast of Kibi, Eastern Region. These are the largest known kaolin deposits in Ghana. They occur in three swamps and have an average thickness of 18 meters. The ore reserves of the Atewa Range were estimated at 3.3 million tons containing 60% kaolinite, 30% silica, 5% mica, 0.77% K_20 and 0.01% Na_20. Investigations were still underway to determine the economic suitability of the Atewa Range ores for the manufacture of tiles and household utensils.

Brown plastic clays suitable for brick and tile manufacture occur in all Regions of Ghana. The Ghana Geological Survey Department has made surveys and maps of some of these deposits that indicate their locations and estimated reserves.[5]

Diamond.—Between 1920 and March 1978, a total of 28 million carats of diamond had been exported from Ghana, mainly from the GCDL mine at Akwatia, Eastern Region. Diamond production decreased in 1978 and 1979. A serious decline in production was caused by increased difficulties in importing macinery and spare parts because of persistent foreign exchange constraints. In the fiscal year that ended March 31, 1978, a total of 1,881,199 carats of diamond was recovered from 1,111,771 cubic meters of gravel, compared with around 2 million carats in the previous year. An amount equivalent to about 4% of the total produced by GCDL was also produced by local licensed diggers. The reserves of the present GCDL concession in the Akim Abuakwa and Akim Kotoku areas were expected to be exhausted by 1982. Prospecting was continuing on the Birim River below Akwatia to the confluence with the Pra River. These areas were believed to have a potential of 50 million carats. On August 24, 1979, the UNDP allocated $2 million spread over 3 years for the Birim River Diamonds Prospecting Project. The GCDL minority partner, Consolidated African Selection Trust, was expected to carry out the prospecting program. It was anticipated that a substantial investment in new surface mining equipment would also be required before operations can begin in the new area.

Limestone.—Since the discovery of the Nauli limestone deposits in 1922, ten feasibility studies have been completed by the Ghana Geological Survey Department and others. A major conclusion has been that underground mining would not be possible because of engineering and technological difficulties. Opencast mining was planned to produce limestone for use as a flux in the Integrated Iron and Steel's Opon-Mansi project. Ore reserves at Nauli were estimated at 400 million tons with an average content of 51.86% Ca0, 1.74% $Si0_2$, 1.6% Mg0, 0.80% Al_20_3, and 0.79% Fe_20_3.

Deposits of limestone suitable for cement occur at Bonga-da and Buipe, Northern Region. It was estimated that there were at least 15 million tons of very good quality limestone and some 25 million tons of dolomite in the Bongo-Da area. Geological investigations have proved 6.62 million tons of low-magnesium limestone that could be mined from four quarry sites in this area. At Buipe, approximately 14 million tons of limestone suitable for portland cement production and 22 million tons of dolomite suitable for production of Roman or natural cement was available. The limestone could be mined opencast in four areas, and the raw materials could be transported by Volta Lake.

MINERAL FUELS

Petroleum.—In 1978 and 1979, several U.S. companies were actively involved in oil production and exploration in Ghana. These included: Agri-Petco Co. (Tulsa, Okla.); Phillips Petroleum Co. (Bartlesville, Okla.); Texaco, Inc. (New York); J. J. Simons (Muskogee, Okla.) Offshore Hydrocarbons (Muskogee, Okla.); Aracca Petroleum Corp. (New York); Texas International Petroleum Co. (New York); and Louisiana Land and Exploration Corp. (New Orleans, La.). A Phillips Petroleum Group (Phillips, 50% ownership; Azienda General Italliani Petroli S.p.A. (AGIP), 25%, and Getty Oil, 25%) was drilling three wells in its offshore concessions and found 32° API oil at 12,000 feet in one of them. Some associated gas (8.2 million cubic feet per day) was also found. Louisiana Land Corp. acquired two-thirds of Agri-Petco's offshore concessions and was looking for a partner before taking steps to explore in these areas. Agri-Petco was the only producing company.

Agri-Petco began production from the Saltpond field in mid-October 1978. By November, the high-gravity, low-sulfur crude oil from this field was being produced from six wells at the rate of 5,000 barrels per day. Reserves of 36° and 40° API crude oil were estimated at about 6 million barrels. The field was being developed under a 30-year contract. Agri-Petco Ghana Inc. (owned 42.8% by Texas City Refinery, 42.8% by National Cooperative Refinery Assoc., and 14.4% Farm Bureau Oil Cooperative) was also granted investment insurance by the Overseas Private Investment Corp. (OPIC). Agri-Petco's investments totaled some $40 million to yearend 1978. By 1979, output had declined to 3,200 barrels per day because of technical problems and because the wells were shut down for a month in July 1979 for maintenance work. The Government takes a 12.5% royalty on oil produced and has an option to buy 50% of the output.

Four corporations were under the Ministry of Fuel and Power; they were the VRA, the Electricity Corp., the Ghanaian Italian Petroleum Limited (GHAIP), and the Ghana Oil Co. Ltd. (GOIL). The Ministry called upon GOIL and GHAIP to find ways to improve the distribution of petroleum products throughout the country and to coordinate operations between the GHIP refinery at Tema and the oil distributing company GOIL. In order to improve the distribution of petroleum products, bulk haulage of petroleum products by railroad was planned to be introduced along with the construction of storage tanks at various strategic points within the country. During the 1978-79 period, certain petroleum products, including line engine oil, brake fluid, ear oil, and insecticides, disappeared from the country's petroleum stations and were being sold at high prices on the black market. Lacking sufficient credit, the oil distribution companies had apparently not imported any of these products for some time, thus creating a shortage.[6] GOIL was planning to build a $2 million engine oil plant at Tema.

The Mineral Industry of Greece[1]

By Roman V. Sondermayer[2]

During 1978 and 1979, the mineral industry of Greece showed mixed results. In general, the international steel crisis adversely affected the country's mineral exports; but in the second half of 1979, increased activities in European stainless steel boosted exports of magnesite and nickel. Also, the construction boom in countries where crude oil is produced stimulated Greek cement exports. The Government of Greece participated considerably in the activities of the country's mineral industry; it was a dominant factor in crude oil, lignite, and chromite production, in exploration for all minerals, and in the financing of mineral activities. The mineral industry's share in the gross national product (GNP) in 1978 was about 7.3%, reflecting a drop of 0.2%, compared with the industry's share in 1977. Mining accounted for 1.3% of the mineral industry's share in GNP in 1978. The mineral industry employed an estimated 20,000 persons, or 0.6% of the total labor force.

Bauxite, nickel, and nonmetals continued to be the most important minerals produced in the country.

During 1978 and 1979, the most important developments in the Greek mineral industry were expansion of bauxite mines and an alumina plant; completion of new nickel-producing installations; and the start of construction of an asbestos mine and mill.

PRODUCTION

The Greek mineral industry was owned both by the Government and by the private sector. The Government acted through publicly owned corporations, of which the ones of principal interest to the mineral industry were Public Power Corp. (PPC); Hellenic Industrial & Mining Co. (HIMIC); the Public Petroleum Co. (DEP); Project Studies and Mining Development Corp., S.A. (GEMEE); the Institute of Geological and Mining Research (IGME); and, for financing, the Hellenic Industrial Development Bank (ETVA). In the private sector, the major mining companies were the Bodossakis Group (nickel, sulfide ores and concentrates, fertilizers, etc.); the Eliopoulou-Kyriacopoulou Group (bauxite, perlite, expanded perlite, bentonite, barite, and kaolin); the Scalistiri Group (magnesite, refractories, bauxite, and chromite); Aluminium de Grèce S.A. (aluminum); Grecian Magnesite (magnesite); Mykobar S.A. (barite, bentonite); and four companies that shared Greece's cement output, Heracles (known also as General), Titan, Chalkis, and Halyps.

Table 1.—Greece: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
METALS

Other do	8,523	7,361	6,658	[2]11,759
Refinery fuel and losses do	4,248	3,668	4,789	[2]5,852
Total do	81,733	78,513	85,541	[2]112,633

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed, a variety of other crude construction materials (clays, sand and gravel, and stone) is produced, but output is not reported and available information is inadequate to make reliable estimates of output levels. Cobalt is also produced and is included with nickel.
[2]Reported figure.
[3]Exports.
[4]Ni content is also reported under "Nickel."
[5]Black sheet, galvanized sheet, reinforcing bars, and wire only.
[6]Includes antimonial lead and hard lead.
[7]Also includes Co content.

TRADE

During 1978, Greece again had a negative foreign trade balance, caused mostly by imports of fuels. Overall exports of the sector showed an increase by 20%, and metal exports increased by 14%, but exports of ores and minerals decreased by 1.6%. Trade in 1979 continued at the same level as in 1978. The United States had a positive trade with Greece.

Tables 2 and 3 show details of the country's trade in minerals.

Table 2.—Greece: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1976	1977	Principal destinations, 1977
METALS			
Aluminum:			
Bauxite and concentrate thousand tons	1,367	1,752	U.S.S.R. 600; Romania 427; Netherlands 308.
Oxide and hydroxide	194,732	NA	
Metal including alloys:			
Scrap and unwrought	88,970	78,635	Italy 33,688; France 29,798; Lebanon 9,918.

COMMODITY REVIEW

METALS

Alumina and Aluminum.—Greece was virtually self-sufficient in alumina and aluminum and was an important exporter of bauxite. Aluminium de Grèce S.A. (AG), established by the French firm Pechiney in 1960, operated the only alumina-aluminum production facility in Greece, at Distomon, Boeotia. AG gets its bauxite from both independent and affiliated mining companies. It supplies domestic aluminum fabricators with nearly all their annual aluminum ingot requirements. (AG's aluminum ingot processing in 1979 totaled an estimated 145,000 tons.) Although AG is obliged to sell 15% of its aluminum production to the Greek market at export prices (rather than at the high protected domestic price), the Government asked the firm to increase this amount in 1979 to 20% to help aluminum fabricators lower costs and thus make their products competitive. AG complied with the Government's request.

AG had an annual capacity of 500,000 tons of alumina and 150,000 tons of aluminum. In January 1976, AG announced plans (which were subject to Government approval) to invest \$100 million[3] to raise its annual alumina production capacity to 600,000 tons by 1980. Plans were for the entire new additional alumina output to be exported. AG expected to spend \$40 million of this new investment to purchase foreign equipment. However, Government approval was not obtained in 1979 for expanding the alumina facility. But AG did obtain permission to spend \$13.2 million for improved production, better working conditions, and to save energy.

Bauxites Parnasse Mining Co. S.A., of the Eliopoulou-Kyriacopolou Group, planned to construct an alumina production plant with a capacity of 600,000 tons per year. This investment was being cosponsored by the HIMIC and was approved by the Greek Government in March 1976. At the end of 1979, the sponsors were seeking foreign participation (which was not to exceed 49% equity participation), but no substantial progress had been made, principally because of the sponsors' insistence that the foreign participants guarantee a secure market for the plant's production. Meanwhile, there were intergovernmental talks at the ministerial level with the U.S.S.R., Poland, Bulgaria, Libya, and Iraq aimed at finding a possible long-range market outlet for the plant's alumina.

Bauxite.—During 1978 and 1979, Bauxites Parnasse, Greece's leading bauxite producer and exporter (1 million tons annually), and major supplier to AG (450,000 tons annually), continued to expand its underground mining facilities. Bauxites Parnesse's goal was to reach an output of 1.5 million tons annually by 1982. The company projected that by that time, half of its ore would come from underground. A Swedish firm, WP-System AB, a subsidiary of Granges AB, provided know-how throughout 1978 and 1979 for underground mining technology and training. In 1979, Bauxites Parnasse selected an Austrian consultant to aid in the restoration of the landscape at its depleted opencast mines and to program in advance appropriate land restoration for new opencast mines.

Eleusis Bauxite Mines, Mining-Industrial & Shipping, Inc. (Scalistiri Group), was the country's second largest producer (capacity: 720,000 tons per year), with mines near Eleusis, Lamia, Itea, and Kymi. The firm completed a heavy-media separation unit at Eleusis for treating an additional 250,000 tons per year of high-lime bauxite and tailings and put the unit onstream in June 1978. A second similar unit is under construction at Lamia. The firm also operates AG's Delphi Bauxites S.A. mines, which produce about 200,000 tons per year. (This production is included in the figure shown above for the capacity of Eleusis Bauxite.)

Greece as a whole produces over 3 million tons of bauxite annually (average content 54% to 65% Al_2O_3), of which 75% is exported and the remainder is consumed locally (primarily by the AG aluminum smelter at Distomon).

Chromite.—An intensive chromite exploration program, which was started in mid-1976 by IGME and GEMEE, continued at Vourinos Mountain, near Kozáni. Measured reserves reportedly amounted to 1 million tons (20% Cr_2O_3 content); additional probable reserves were estimated at 2 million tons; and there were indications of an additional 3 million tons in reserves. Exploration continued through 1979, and a 2,000-meter-long adit driven at Skoumitsa reached the ore body that was anticipated there.

Exploration was continuing at this site for the purpose of measuring the reserves, and although the research agencies had not yet completed exploration, the combined measured, probable, and indicated reserves were estimated at about 3 million tons (17% Cr_2O_3 content). IGME was also continuing exploration at Vourinos, outside Skoumitsa, and had reportedly located another 1-million-ton reserve.

During 1979, GEMEE transferred ownership of its mines and mining concession to the newly formed Hellenic Ferro Alloys.

The Government continued to give a high priority to the development of chromite facilities. At the end of 1978, a decision was made to establish a ferrochrome industry by 1982, to be undertaken jointly by the Government-sponsored HIMIC and ETVA. The Finnish firm Outokumpu Oy completed a feasibility study for HIMIC early in 1978. A plant projected to cost $30 million was planned, with production targeted at 30,000 tons of high-carbon ferrochrome per year, using 50,000 tons annually of chromite concentrate. The plant was expected to employ 120 persons. Several followup proposals, including some from abroad, were being evaluated by HIMIC. It was expected that a decision on the award would be made before the end of 1980.

Iron Ore.—In 1979, IGME continued exploration work on previously worked deposits on the island of Serifos, where remaining reserves were estimated at about 40 to 50 million tons having an average iron content of 25%. GEMEE planned to continue the work on Serifos in 1980, with drillings totaling 10,000 meters. Laboratory analyses and beneficiation tests of the ore were planned to follow to determine specific characteristics of the deposits and to evaluate whether these deposits can be worked economically and beneficiated for the purpose for which they are needed.

Lead and Zinc.—During 1978 and 1979, the Greek Government was keen on establishing a lead and zinc metal industry based on the indigenous mixed sulfides and beneficiated calamine (smithsonite) of northern Greece. An investment estimated at about $150 million for this industry was planned, including a smelter at an undetermined location. It was projected that the smelter, when completed, would have an annual production capacity of 70,000 tons of zinc and 40,000 tons of lead metal. To make the project more economically viable, planners studied the possibility of using the pyrite included in the mixed sulfides to establish a sulfuric acid unit with an annual production capacity of 150,000 tons. A 600-man labor force for the entire lead and zinc project was anticipated. However, at year end, no decision was made public on the sulfuric acid unit.

ETVA and HIMIC were examining the project's possibilities, and in 1979, ETVA requested the British firm Imperial Smelting and the West German firm Stolberg Consulting to do a feasibility study. The study, scheduled for completion before the end of 1980, was to be based on current international market conditions, prices, and available ore reserves. The decision on whether to go ahead with the project will rest with the Ministry of Industry. The Imperial Smelting process which gives as coproducts lead metal and zinc metal, was considered to be the most economic one for this project.

Besides planning for a smelter, Greek authorities were also making efforts to discover new reserves and assess the existing lead and zinc reserves on the national territory.

Early in 1979, IGME conducted drillings on Thassos and located zinc carbonate (smithsonite, or calamine) reserves. IGME's laboratory tests on beneficiation methods for these deposits were successful. The Imperial Smelting process requires an increased quantity of zinc concentrate; therefore the Greek authorities were examining the possibility of using the beneficiated calamines to meet the added zinc concentrate requirements for this process. In August 1979, IGME was also successful in locating mixed sulfide deposits on Thassos Island and was continuing its exploration for sulfides in other areas of Greece, particularly in the north, where prospects were considered good. Meanwhile, GEMEE, which has mining concessions containing lead and zinc in northeast Chalkidiki, was seeking funding from the European Economic Community (EEC) to conduct research on its concessions.

Nickel.—Larco S.A. (Bodossakis Group) at the end of 1978 completed an expansion program costing $68 million at its Euboea and Boeotia facilities, thereby increasing annual production from 15,000 tons to 27,000 tons of nickel. In 1979, the company gradually started up the new installations, conducted test runs, and made all necessary modifications for full operation, which was planned for 1980. The new plant had a Krupp rotary kiln and equipment from France, including an electric furnace constructed by French engineers. Larco also installed new pollution control facilities at its smelter. New mine equipment (principally from the United States) raised the output of laterite ore to 3 million tons per year. In 1979, Larco completed a new crushing facility (with a dust-collection system) near its mines. The new facility is located 460 meters above sea level and is linked to the Politika port by an 8-to-10-kilometer closed-top ore conveyor. Within the next 3 years, Larco planned to reorganize its blending and stockpiling installations at Politika by installing additional conveyor belts, a new reclaimer, and a new stacker.

Two nickel projects were shelved pending an improvement in world nickel market conditions and the availability of an adequate electric power supply. These projects were 1) Larco's long-range plan to raise its nickel capacity to 40,000 tons per year, at an estimated cost of $170 million; and 2) Eleusis Bauxite's plan to build a 10,000-ton-per-year nickel plant.

Steel.—A new cold rolling mill, which was being designed to produce steel sheet suitable for car bodies, was under construction at Eleusis during 1979. Owned by Halyvourgiki, the new plant's annual capacity was projected at 400,000 tons of good-quality products. A new addition was expected to increase the combined annual steel capacity of Halyvourgiki to 1.5 million tons. In addition, plans were prepared for a 250,000-ton-per-year plant to produce steel bars, rods, sections, and stainless steel near Thessaloniki; and for a miniplant for the production of bars at Patres. Hellenic Steel examined possibilities for expansion of its production capacity for hot rolled products from 400,000 tons to 750,000 tons.

NONMETALS

Asbestos.—The foundation stone for a new $65 million asbestos mine and processing plant was laid at the end of April 1978 in Zidani, near Kozáni, in north-central Greece. It was anticipated that the mine and plant would have a capacity of about 100,000 tons of fiber per year and would employ 300 persons; completion was scheduled for 1980. ETVA was providing financing for the project, which was to be carried out by EVTA-controlled Asbestos Mines of Northern Greece, Mining Societe Anonyme (MABE). Plans were for shares of MABE to ultimately be available for purchase by the public, but ETVA was unsuccessful in obtaining foreign participation.

At yearend 1978, the work of building roads, bringing in power, and erecting housing was completed under the supervision of Kilburn Engineering Ltd. of Canada; and in 1979, actual construction of the plant began. Reserves at the mine are adequate to support an output of 100,000 tons per year of fiber for 25 years. An opencast mine was planned with a final open pit diameter of 1,000 meters. The deposit is located within an ultrabasic rock intrusion into a series of gneiss and schists overlain by marble and was discovered in 1936. Two U.S. companies, the Kennecott Copper Corp. and Cerro Corp., were involved at different times in exploration and operation of pilot plants. ETVA acquired the Zidani property from Cerro Corp. in January 1977. At the mine site, stripping operations were underway during the last 6 months of 1979.

MABE ordered most of the pit and plant equipment from manufacturers from the United States, Canada, the United Kingdom, and the Republic of South Africa. Pollution control equipment was ordered from the British-Canadian firm Tilghman Wheelabrator Corp. The expenditure for foreign equipment and for engineering studies to be conducted abroad was expected to amount to 55% ($37.5 million) of the total investment. MABE planned to export 80% of the plant's annual output of asbestos fibers and was already in contact with foreign customers.

ETVA reportedly planned to establish an independent Greek company in 1981 to handle exports and sales of the asbestos fibers produced at Zindanion. It was reported that foreign firms specializing in the asbestos trade would be invited to participate in the company.

Barite.—The Silver and Barite Ores Mining Co. (Eliopoulou-Kyriacopoulou Group) had under consideration the establishment by 1981 of a 100,000-ton-per-year beneficiation facility for low-grade barite deposits on Milos Island. The firm is a major producer and exporter of industrial minerals, including bentonite (capacity 350,000 tons), kaolin, perlite, and barite. No decision on this plant was announced during 1979.

Cement.—Compared with the previous year's sales, estimated domestic sales of cement were up 6.5% in 1979 (to 6.4 million tons), reflecting increased building activity. All cement exports were made in free currencies and almost all the exported cement was transported in Greek-owned vessels. Among European cement exporters, Greece ranked second after Spain. Four cement companies shared the country's production capacity, which amounted to 11.9 million tons per year.

In the fall of 1978, cement shortages were reported, especially in the Attika area. In part, this was due to a shutdown in September 1978 of quarries in the Athens area for environmental reasons.

The Titan Co. obtained Government approval during 1977 to invest $44 million to build an additional 1-million-ton-per-year cement plant at Kamari, Boeotia; in 1979, the plant was completed. In December 1979, Heracles General Cement Co. obtained Government approval to establish a 1.5-million-ton-per-year plant at Milaki, near Aliveri in Euboea. Halyps S.A. completed the installation of a 600,000-ton-per-year rotary kiln that replaced three obsolete ones. The kiln's first output was expected in 1980. During 1978 and 1979, projects were in the early stages of planning for expansion of the Halkis Cement Co. and for construction of a new 1-million-ton-per-year cement plant for the island of Crete.

Magnesite.—The Financial-Mining-Industrial and Shipping Corp. (FIMISCO) Scalistiri Group, the country's major magnesite and refractory producer, shelved a project to manufacture refractory magnesia from seawater and dolomite. However, FIMISCO did build a new plant in Euboea for preconcentrating magnesite tailings and low-grade ores. The capacity of the plant was 400 tons per hour, and technology was developed by FIMISCO to raise the magnesite content of the treated product from 5% to 10%. Grecian Magnesite Ltd., with mines at Gerakini and Chalkidiki, purchased its third 180-ton-per-day rotary kiln from Smidth of Denmark for the production of deadburned magnesite and installed it in 1979.

Greece remained a net exporter of magnesite and magnesite refractories, but a slowdown in European steel production disrupted the Greek companies, especially those that had expanded during the boom years.

Marble.—During 1978, GEMEE obtained all the shares of the Hellenic Marble Industrial and Commercial Co. S.A., a company formerly belonging to ETVA. GEMEE was investing $1.6 million in new quarrying and processing machinery and planned to export processed marble in thin slabs. During 1978, Hellenic Marble produced semiprocessed marble for the local market and exported unprocessed marble. No major events relative to the Greek marble industry were reported during 1979.

Phosphate.—In 1976, IGME discovered extensive phosphate deposits at Delvinaki, near Ioannina, Epirus, that exceeded 1 billion tons. But these deposits are of poor quality (their phosphate content ranges from 8% to 28%), and their beneficiation presents serious problems. IGME reported that these deposits were of many different types and that two of the types were present in substantial quantities. In 1979, IGME developed a laboratory method for beneficiating one of these two phosphate types, francolite, which has a P_2O_5 content of 13% to 20%. The Epirus deposits of this type amount to about 10 million tons. IGME planned to conduct a pilot-plant test in 1980. It was anticipated that development of the Epirus phosphates would result in considerable foreign exchange savings for Greece, which annually imports $25 to $30 million worth of phosphate.

Quartzite.—In 1978, Hellenic Industrial Minerals S.A. (ELVOIR) (51% controlled by GEMEE), inaugurated a 70,000-ton-per-year processing plant (including crushing, screening, and washing facilities) at its new quartz quarries 40 kilometers northeast of Thessaloniki. The quartz extracted from these quarries is 99% pure and is suitable for the production of metallic silicon. During 1978 and 1979, the second and third years of its operation, ELVOIR exported 26,000 tons of processed material, principally to Sweden, but also to Norway, Italy, and Switzerland. In 1979, ELVOIR was examining the feasibility of installing a milling plant to produce powder from processed tailings for various local uses.

Salt.—During 1978, HIMIC established the firm, Messolonghi Saltworks S.A., to expand the saltworks at Messolonghi from an annual capacity of 80,000 tons to 450,000 tons. HIMIC, which controls 70% of the shares of the new company, planned to invest $817 million. Tecnosel S.A. of Switzerland prepared the engineering study and was planning to undertake part of the project's supervision. During 1979, work on the Messolonghi expansion project continued. It was projected that upon completion the saltworks would supply 120,000 tons per year of salt to a petrochemicals complex under construction by the Government of Greece in the Messolonghi area. Previous plans by the Government to recover chemicals from saltwork bitterns and to produce soda ash are in abeyance because the results of a feasibility study conducted by the Catalytic International of London were negative.

MINERAL FUELS

Lignite.—Lignite continued to be the country's only exploited domestic mineral fuel. Lignite was mined and used by the PPC to fuel power stations at Aliveri (Euboea), Ptolemais (near Kozáni), and Megalopolis (central Pelaponnesus).

In 1978 and 1979, PPC began preliminary work to open the untapped Ptolemais South Field (where deposits were estimated at 700 million tons). Meanwhile, the West German technical firm Otto Gold prepared an engineering study for development of this field. It was hoped that the field would produce sufficient lignite to supply seven more 300-megawatt power units at Kardia (five of which were planned to be located at Agios Demetrios, a newly designated location near Kardia) in the 1980's.

During the year 1979, PPC began infrastructure work on the installation of a 12-kilometer conveyor belt to transport the overburden. This conveyor belt, scheduled for installation in 1980, was to be constructed and installed by the Greek firm, Metal Constructions of Greece S.A. (METKA), using West German technology. In 1978, METKA was also given a contract to install a second conveyor system of the same length to transport lignite. The bucket-wheel excavators and stackers, which were ordered in 1976 from West German and East German firms (Krupp and Machinen-Export), were scheduled to be delivered in 1980. In 1978, PPC also accepted an engineering study prepared by West German consultant Hanz Goergen recommending methods for developing the Kiparisson and South Horemi fields at Megalopolis to fuel the new unit and to increase annual lignite production at Megalopolis from 9 million tons to 14 million tons. However, tenders issued in 1978 for mining equipment and the new unit were cancelled and were to be reissued in 1979. At Aliveri (the only underground lignite mine) lignite deposits were almost exhausted, and PPC expected to close the mine by 1982.

At Amynton, intensive exploration carried out by PPC and IGME since 1975 has verified the existence of important lignite deposits. (The 1978 and 1979 revised reserve figures show 438 million tons of measured reserves, of which 250 million are mineable, with a calorific value of 1,950 calories per kilogram.) During 1978, PPC completed a preliminary study of the project and again selected the West German consultant Hanz Goergen to do an engineering study for the development of a mine to produce 7 million to 7.8 million tons of lignite annually.

During 1978, PPC, in cooperation with IGME, continued its search for lignite. Countrywide, 247 lignite exploration holes were drilled for a total depth of 25,934 meters. A 200-million-ton deposit of lignite was measured at Perdika-Komnion in 1979, of which 50 million tons are considered mineable. In 1979, PPC invested $141 million for the development of lignite mines and $3.8 million for lignite exploration.

Petroleum and Natural Gas.—Greece did not produce crude oil or natural gas in 1978 or 1979; all of the country's demand was met through imports. Exploration, however, continued onshore in northern Greece and on some of the islands and offshore near the island of Thassos. A small oilfield was discovered in 1975 near Thassos, and preparations for offshore production were underway during 1978 and 1979.

Four petroleum refineries with a total capacity of 20 million tons were in operation in Greece during 1979. The largest refinery was the Motor Oil (Hellas) Corinth Refineries, Corinth, with a crude oil capacity of 7 million tons per year.

Uranium.—During 1979, the Democritus Research Center, which has an annual uranium exploration budget of about $1.1 million, continued its exploration program in eastern Macedonia and Thrace. The first phase of explorations began with a carborne scintillometer survey of western Macedonia and Epirus. No exploitable deposits were found, but results were encouraging; and more information was expected to be available by 1981 or 1982. In 1978, IGME also started uranium exploration in Epirus under a joint program with Democritus. A lignite deposit at Marameva, Serres, was found to contain about a possible 2,000 tons of U_3O_8; work to develop an extraction process was expected to start in 1980.

The Mineral Industry of Hungary

By George Rabchevsky[1]

The overall growth of the Hungarian national income in 1978 was less than 4%, one percentage point below the plan; with industrial output expanding by over 5%.[2] Metallurgy and mining and light industry output grew by only 2% to 3%. Among the centrally planned economy countries, Hungary ranked statistically behind the German Democratic Republic (GDR) and Czechoslovakia in per capita income. Total investment in 1978 amounted to Ft197 billion,[3] considerably exceeding the planned level.

Also, Hungary, in 1978, experienced a record trade deficit of over US$1.5 billion; imports increased almost 13%, while exports grew only 1%. Trade with COMECON[4] grew more slowly than trade with the rest of the world and the share of COMECON in Hungary's total trade continued its slow decline, to just over 50%.[5] The most important development in the United States-Hungarian trade was the signing in 1978 of a bilateral trade agreement extending Most Favored Nation (MFN) tariff treatment.

Hungary's poor economic performance persisted in 1979. The national income, for example, rose only by 1.6% to Ft550 billion, instead of the planned 3% to 4%, the lowest growth since 1945, and prices rose by 9%.[6]

Capital investment in 1979 included: the Paks nuclear powerplant (Ft5.5 billion), the Belapatfalyi cement plant, the Lenin iron and steel combine (Ft2.5 billion), the Deak bauxite mine, oil and gas exploration, and aluminum industries. The 1979 planned State Budget income amounted to Ft407.2 billion and the Budget expenditures, Ft410.8 billion, resulting in a deficit of Ft3.6 billion. The expenditures of the Ministry of Metallurgy and Machine Industry were set at Ft113.2 million and Ft863 million for projects at the Central Geological office.[7]

The planned 1980 target for national income is set to rise by 3% to 3.5% and industrial growth is to be 3.5% to 4%. Investment in 1980 is planned to decrease significantly (4% to 5%) and the domestic and foreign trade deficit is not expected to be changed much from the previous year. Owing to the poor performances in the previous 2 years, however, the planners have not set definitive targets in most areas for the next 5 years.

PRODUCTION

The Hungarian production of mineral commodities stagnated in 1978 and 1979 and, except for the nonmetals and mineral fuels, the production plans were not fulfilled. Even though the output of crude oil showed a slight increase, the production of natural gas decreased. The overall production of the metallurgy, mining, and light industry increased by 2% to 3% over the 1978 year.[8]

In 1978, 10 large mineral projects were initiated, 11 were completed in 1979 and, of those started in 1978 and 1979, 2 will be completed in 1980. Most of those projects involved modernizations and improvements in existing facilities, such as the Szeged oil and gas complex, the Tisza oil refinery, steel production at the Ozd metallurgical works, the Lenin steel plant, construction of the Recsks copper mine, the Danube power stations II and III, the Adriatic crude oil pipeline, and others.[9] New bauxite mines have been opened in 1979 and a substantial increase in the production of alumina is being planned. The Ajka plant is to increase its production of alumina in the future and the Szekesfeherver aluminum rolling mill was under expansion. Hungary also initiated extensive exploration and extraction programs for coal between the Gryöngyos and Füzesabomy areas.

Hungary continued to lead other East European countries in the output of bauxite; most other mineral commodities, however, were imported, including crude oil and refinery products. Because of the depletion of readily accessible reserves, the drilling for oil and gas proceeded up to 6,000 meters in depth. According to recent Hungarian sources, the value of mineral reserves in the country was estimated at about Ft600 billion.

In 1978, Hungary reorganized its resources, research and development activities and found the Central Mine Development Institute (KBFI). In addition to the domestic exploration program, Hungary also participated in geological projects in Mongolia, Cuba, and Iraq and a number of the COMECON countries. The joint prospecting program of the COMECON countries is under the control of the so-called Coordination Center (KOC), the Intermorgeo and Intergeotechnika being the actual working groups of the Center. Furthermore, Geoinform is an organization whose purpose is to insure exchange of mineral information among the COMECON members.

Table 1.—Hungary: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
METALS				
Aluminum:				
Bauxite, gross weight ---- thousand tons	2,918	2,949	2,899	3,000
Alumina, gross weight ---- do	732	783	782	800
Metal, primary	70,499	71,335	71,359	71,500
Copper:				
Mine output, metal content	[r]1,300	1,000	500	300

(Metric tons unless otherwise specified)

Commodity[1]	1976	1977	1978[p]	1979[e]
NONMETALS —Continued				
Lime, calcined ---- thousand tons--	732	743	740	740
Nitrogen, N content of ammonia ---- do----	[r]703	729	746	750
Perlite ----	96,180	103,270	92,630	93,000
Pyrite, gross weight[e] ----	7,000	7,000	7,000	7,000
Refractory materials, n.e.s.:				
Chamotte products ---- thousand tons--	169	171	163	160
Chrome magnesite products ---- do----	47	44	42	41
Sand and gravel:				
Gravel ---- thousand cubic meters--	12,625	12,890	13,821	14,500
Sand:				
Common ---- do----	471	288	279	280
Foundry ---- thousand tons--	687	732	787	790
Stone:				
Dimension, all types ---- do----	4	3	2	2
Other:				
Dolomite ---- do----	1,126	1,173	1,171	1,175
Limestone ---- do----	8,038	8,263	8,598	8,700
Quartzite ---- do----	42	34	31	31
Sulfur:				
From pyrite[e] ----	3,000	3,000	3,000	3,000
Byproduct, elemental, all sources ----	7,778	8,004	8,633	8,700
Total ----	10,778	11,004	11,633	11,700
Sulfuric acid ----	617,208	632,632	643,795	650,000
Talc ----	16,000	16,000	17,500	17,500
MINERAL FUELS AND RELATED MATERIALS				
Carbon black[e] ----	4,000	5,000	5,000	5,000
Coal:				
Bituminous ---- thousand tons--	2,934	2,925	2,954	3,000
Brown ---- do----	14,779	14,433	14,302	14,000
Lignite ---- do----	7,544	8,096	8,414	8,600
Total ---- do----	25,257	25,454	25,670	25,600
Coke:				
Coke oven:				
Metallurgical ---- do----	604	586	604	610
Other ---- do----	169	[e]170	[e]170	170
Total ---- do----	773	756	774	780
Gashouse ---- do----	203	[e]190	[e]185	180
Grand total ---- do----	976	946	959	960
Fuel briquets ---- do----	1,018	1,105	1,169	1,180
Gas:				
Manufactured ---- million cubic feet--	22,531	20,376	19,811	19,000
Natural, marketed ---- do----	214,783	253,464	259,420	224,000
Natural gas liquids:				
Natural gasoline ---- thousand 42-gallon barrels--	1,148	1,420	2,380	2,400
Liquefied petroleum gas ---- do----	1,740	[e]2,150	[e]3,600	3,600
Peat, agricultural use[e] ---- thousand tons--	70	70	70	70
Petroleum:				
Crude:				
As reported ---- do----	2,142	2,191	2,198	2,200
Converted ---- thousand 42-gallon barrels--	16,343	16,717	16,771	16,405
Refinery products:[3]				
Gasoline, including naphtha ---- do----	10,038	9,928	11,475	12,500
Kerosine and other light distillates[4] ---- do----	7,626	6,107	6,285	6,400
Distillate fuel oil ---- do----	25,707	25,685	26,968	27,500
Residual fuel oil ---- do----	23,370	23,543	24,549	25,000
Lubricants ---- do----	1,317	1,228	1,121	1,200
Other:				
Liquefied petroleum gas ---- do----	1,067	[e]1,100	[e]1,100	1,100
Asphalt and bitumen ---- do----	3,600	4,006	4,145	4,200
Paraffin and petrolatum ---- do----	200	198	208	210
Total ---- do----	72,925	71,795	75,851	78,110

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, diatomite, gypsum, and a variety of other crude construction materials such as common clays are produced, but available information is inadequate to make reliable estimates of output levels.

[2]18%-20% Mn.

[3]Excludes refinery fuel and losses.

[4]Data derived by subtracting reported motor gasoline and white spirit data from reported light refinery products total.

TRADE

Hungary's trade deficit in 1978 was Ft60.2 billion, 50% over the planned target and a record high to date. Thus, early in 1978, the government implemented a number of macroeconomic measures designed to slow the growth of the domestic economy and to restore trade equilibrium. Consequently, overall exports in 1979 increased by 17% and imports by 3%. The foreign trade balance was thus improved in 1979, especially in the trade with the dollar sector.

In 1978 and 1979, Hungary had trade agreements with about 145 countries. Over 55% of Hungary's foreign trade was conducted with centrally planned economy countries, especially the COMECON members. Almost 90% of Hungary's energy and 70% of its raw materials were imported from those countries.[10] Hungarian exports to those countries included perlite, dolomite, sand, and manganese oxide. In 1979, Hungarian exports to the U.S.S.R. rose 8% and imports by 12% representing 33% of the total foreign trade turnover. Because of the completion in 1979 of the Orenburg gas pipeline, Hungary received three times more natural gas than previously. Iron ore was also imported from the U.S.S.R. In addition, the U.S.S.R. provided technical and financial aid to Belapatfalva cement plant, delivered an oxygen converter to the Danube iron works, and worked on the Paks nuclear power station.[11] Overall, the U.S.S.R. provided Hungary with a substantial amount of its petroleum, electric power, natural gas, and raw materials, including minerals such as iron and manganese ore, pyrite, asbestos, aluminum, other nonferrous metals, phosphate, and sulfur. The Soviet petroleum exports made up 75% of Hungary's consumption. The 1980 Hungarian import agreement with the Soviet Union included 7.5 million tons of crude oil, 3.8 billion cubic meters of natural gas, as well as electricity, and iron ore.[12]

The GDR in 1978 and 1979 remained Hungary's second largest centrally planned economy trading partner. As before, machines and equipment made up 70% of the trade. Hungary's COMECON trade increased by 6.9% in 1979, of which exports rose by 8.1% and imports by 5.9%, slightly below the planned levels.[13]

In 1978 and 1979, approximately 38% of total Hungarian foreign trade was conducted with the developed market economy countries and 7% with the developing countries. Of the overall foreign trade with the market economy countries, in 1978 and 1979, trade with the member countries of the European Economic Community (EEC) remained about 60%. In 1978, the EEC introduced trade restriction on the Hungarian steel and other exports, thus supposedly contributing to the decline in Hungarian exports. Hungarian imports from those countries fell slightly (by about 0.2% of US$1 million) in 1979, while exports rose 28%, thus substantially decreasing Hungary's trade deficit with these countries from an estimated US$1.1 billion in 1978 to US$435 million in 1979. This was the result of measures taken by the Hungarian government to reduce their imports, to slow economic growth, to lower investment, and to increase exports. The increase in exports consisted mostly of metallurgical products and chemicals.[14] In 1978 and 1979, the Federal Republic of Germany was Hungary's largest market economy trading partner, accounting for 10% of total Hungarian foreign trade.[15]

In 1978, Hungary was awarded the most-favored trading status by the United States, subject to annual renewal.[16] As a result, reportedly imports of Hungarian goods in 1979 by the United States increased by 64% over the 1978 level, reaching a record high of US$112.2 million. Overall United States-Hungarian trade in 1979 increased by 14% over the 1978 level. The year 1979 was also the first year in which the U.S. trade agreement and the textile trade agreement with EEC went into full effect and played considerable roles in producing Hungary's good results in its trade with Western markets. The anticipated growth in United States-Hungarian trade during 1980 is 10% to 15%.

Of special interest was the inauguration in 1978 in New Jersey of the Hungarian Tungstram electric bulb factory. It is the first factory jointly owned by Hungarian and U.S. citizens in the United States and probably also the first joint enterprise by a centrally planned economy country on U.S. soil. The enterprise is headed by a board of four directors of which two are Hungarian and two American, with 51% of the shares in American ownership and 49% in Hungarian. By 1979, a second joint United

States-Hungarian company was operating in the United States, the Tramsmed Ray, and one wholly Hungarian-owned subsidiary of Medipex (Foreign Trade Enterprise for Pharmaceutical Products). There was one joint company operating in Budapest, the Radekor/Radelkis and Corning Glass Company, manufacturing electrochemical instruments.[17] Hungary was also evaluating the U.S. market for export of its bauxite processing technology, joint construction in Hungary of alumina plants, oil exploration, and coal and copper mining.

Table 2.—Hungary: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:[2]			
Bauxite	584,319	601,203	Czechoslovakia 330,668; East Germany 189,998.
Alumina:			
Hydrated	6,309	8,605	Finland 8,588.
Calcined	706,539	688,002	U.S.S.R. 394,183; Poland 140,766; Austria 101,432.
Metal including alloys:			
Scrap	17,688	12,128	Italy 7,874; Austria 2,584; West Germany 1,581.
Unwrought	69,580	79,658	Poland 25,937; Czechoslovakia 12,157; Yugoslavia 7,081.
Semimanufactures	37,087	31,385	East Germany 8,147; Czechoslovakia 3,400; Cuba 2,793; Sweden 2,550.
Bismuth metal including alloys, all forms	22	--	
Cadmium metal including alloys, all forms	--	15	All to West Germany.
Chromium oxide and hydroxide	218	259	Turkey 126; Italy 71.
Cobalt oxides and hydroxides	--	42	All to Turkey.
Copper:			
Matte	141	42	All to Switzerland.
Metal including alloys:			
Scrap	2,340	7,254	Austria 4,316; West Germany 1,972.
Unwrought	6,994	3,466	West Germany 2,074; United Kingdom 903.
Semimanufactures	3,584	6,331	Yugoslavia 3,425; West Germany 1,774.
Iron and steel metal:			
Scrap thousand tons	[3]71	[3]42	Italy 26; West Germany 9.
Pig iron[2] do	116	47	Poland 17; Romania 15; Yugoslavia 8; Austria 7.
Ferroalloys do	[3]1	[3]1	Mainly to Austria.
Steel, primary forms[2] do	29	5	Poland 1; Yugoslavia 1.
Semimanufactures:[2]			
Bars, rods, angles, shapes, sections do	786	704	U.S.S.R. 108; West Germany 80; Yugoslavia 80; Iran 64.
Plates and sheets do	343	256	Yugoslavia 30; Poland 28; West Germany 27.
Hoop and strip do	24	22	Romania 9; Yugoslavia 5; Lebanon 2.
Wire and rod do	29	25	Iran 6; Yugoslavia 4; Austria 2; Egypt 2.
Tubes, pipes, fittings do	66	78	Romania 12; U.S.S.R. 10; Finland 8.
Castings and forgings do	17	21	Bulgaria 5; Romania 4; Czechoslovakia 3.
Other do	28	25	West Germany 11; Czechoslovakia 3; Poland 3.
Total do	1,293	1,131	
Lead:			
Oxides	197	--	
Metal including alloys:			
Scrap	69	84	West Germany 44; United Kingdom 40.
Unwrought	675	1,067	Austria 1,027.
Magnesium metal including alloys, unwrought	120	--	
Manganese:			
Ore and concentrate[2]	37,961	49,649	Poland 41,087; Czechoslovakia 8,562.
Metal including alloys, all forms	37	--	
Molybdenum metal including alloys, all forms kilograms	11,000	400	All to West Germany.
Nickel:			
Matte and speiss	13	24	All to Turkey.
Metal including alloys:			
Scrap	344	216	United Kingdom 157; West Germany 48.
Unwrought	299	301	Austria 239.
Semimanufactures	248	190	Yugoslavia 183.

Table 2.—Hungary: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS —Continued			
Platinum-group metals and silver:			
Ores and concentrates value, thousands	--	$27	All to United Kingdom.
Waste and sweepings do	$1,579	$300	All to West Germany.
Metals, unworked or partly worked:			
Platinum-group do	$55	$91	Italy $87.
Silver do	$477	$560	Switzerland $423; United Kingdom $108.
Tin metal including alloys:			
Scrap	35	20	All to United Kingdom.
Semimanufactures	NA	2	All to Indonesia.
Titanium oxides	460	307	Turkey 257; Austria 30.
Tungsten metal including alloys, all forms	1	3	Egypt 1; Indonesia 1.
Zinc metal including alloys, scrap	204	648	West Germany 326; Austria 322.
Other:			
Ores and concentrates	--	810	All to Yugoslavia.
Ash and residue containing unspecified nonferrous metals	14,991	23,783	Austria 15,271; Italy 4,920.
Oxides, hydroxides, peroxides	47	44	West Germany 20; Turkey 13.
Metals:			
Metalloids	391	163	All to Switzerland.
Base metals including alloys, all forms, n.e.s.	84	67	United Kingdom 38; West Germany 15.
NONMETALS			
Abrasives:			
Grinding particles[2]	8,291	7,905	West Germany 5,711; Romania 1,466.
Grinding and polishing wheels and stones	12	30	Turkey 16; Hong Kong 7.
Asbestos	3,266	2,592	Belgium-Luxembourg 1,541; West Germany 1,051.
Boric oxide and acid	--	30	West Germany 20; Yugoslavia 10.
Cement[2] thousand tons	265	189	Yugoslavia 161; U.S.S.R. 17.
Clays and clay products:			
Crude:			
Bentonite[2]	19,400	14,156	East Germany 9,989; Poland 3,962.
Kaolin, crude[2]	7,724	7,025	Czechoslovakia 5,022; West Germany 2,003.
Other	2,799	6,356	West Germany 3,513; Switzerland 2,843.
Products:			
Refractory[2]	24,311	24,037	Romania 5,679; West Germany 3,051; Italy 2,919.
Nonrefractory	858	1,599	Austria 1,478; Denmark 68.
Diamond			
Gem, not set or strung value, thousands	$130	$2	All to West Germany.
Industrial do	$231	$2,135	Belgium-Luxembourg $2,131.
Diatomite and other infusorial earth	4,374	2,963	Austria 2,847.
Fertilizer materials:			
Manufactured:			
Nitrogenous thousand tons	[4]414	[4]337	West Germany 42; Yugoslavia 39; Turkey 12.
Phosphatic do	--	[4]105	NA.
Potassic	1,834	383	Italy 380.
Other, including mixed thousand tons	[2]48	15	West Germany 14.
Ammonia[2]	110,311	75,861	Yugoslavia 44,271; Poland 22,781.
Graphite, natural	120	40	All to Yugoslavia.
Gypsum and plasters	--	22	All to Austria.
Mica, worked	5	2	All to Yugoslavia.
Pigments, mineral: Processed iron oxides	424	1,650	Yugoslavia 1,630.
Precious and semiprecious stones value, thousands	--	$65	France $41; Italy $14.
Pyrite	--	936	All to West Germany.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	100	9,018	All to Yugoslavia.
Caustic potash	30	100	All to Turkey.
Soda ash	[4]300	[4]100	Yugoslavia 59; Sweden 20.
Stone, sand and gravel:			
Dimension stone	1,919	2,696	Switzerland 1,023; Austria 872.
Dolomite	--	358	West Germany 273.
Gravel and crushed rock[2]	171,374	248,453	Yugoslavia 209,345; U.S.S.R. 28,279.
Limestone	56,164	70,935	Yugoslavia 59,805.
Quartz and quartzite	3,483	3,222	All to Austria.
Sand, excluding metal bearing:[2]			
Industrial	30,235	39,550	Yugoslavia 27,291; Austria 7,025.
Construction thousand cubic meters	601	399	Czechoslovakia 364.
Sulfur:			
Elemental	1,831	3,827	All to Austria.
Sulfuric acid, including oleum[2]	112,146	70,588	Yugoslavia 63,358; Romania 7,223.
Talc	180	90	All to Yugoslavia.

See footnotes at end of table.

Table 2.—Hungary: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
NONMETALS —Continued			
Other:			
Crude[2]	97,738	91,353	Austria 25,180; East Germany 23,633; Yugoslavia 11,918.
Oxides of magnesium, strontium, barium	176	40	All to Yugoslavia.
Halogens	--	742	All to Austria.
Halide[2]	2,860	3,205	United Kingdom 1,800; Italy 555.
MINERAL FUELS AND RELATED MATERIALS			
Coal and briquets:			
Anthracite and bituminous coal	4,789	69	All to Austria.
Lignite[2]	56,138	37,460	Austria 21,860; U.S.S.R. 15,600.
Briquets[2]	7,149	290	Austria 269.
Coke, all types[2]	10,293	3,660	Yugoslavia 3,636.
Gas, natural[2] million cubic feet	353	667	Czechoslovakia 385; U.S.S.R. 282.
Peat and peat briquets[2]	2,622	3,537	Yugoslavia 3,322.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	[4]6,279	[4]11,163	NA.
Refinery products:			
Gasoline[2] do	496	1,258	West Germany 391; Austria 390; Yugoslavia 306.

COMMODITY REVIEW

METALS

Aluminum.—About 20% of the 1979 bauxite production was exported to the centrally planned economy countries on the basis of long-term agreements. In 1978-79, alumina was produced at the three alumina works (Almasfuzito, Ajka, Mosonmagyarovar). More than one-third of the alumina produced was exported to the U.S.S.R. in accordance with the Hungarian-Soviet aluminum agreement. About 150,000 tons were exported to Western countries and the remaining alumina was processed by the Hungarian aluminum smelters and used by domestic ceramic and other plants.

The Hungarian Aluminum Corporation, Magyar Aluminiumipari Troszt, (MAT) directs all phases of Hungarian bauxite mining, alumina production, primary smelting, and semifabrication. Hungary, in 1978 and 1979, continued to rank second in Europe in the annual production of bauxite since its discovery of bauxite in 1920 and the start of mining in 1926. Recent changes in the world economy have considerably increased the value of Hungarian bauxite reserves and improved the country's comparative position in Europe. Low-grade bauxites previously considered unsuitable for the production of alumina have now become technically and commercially viable. Alumina production has been one of MAT's most actively developing sectors for many years. Most of the alumina produced in Hungary is exported under the long-term agreements of the COMECON-member countries, especially to the U.S.S.R. Recent renovations of the Almasfuzito alumina plant have increased its annual capacity by 40,000 tons and that of the Ajka plant by 80,000 tons.

Compared with its bauxite and alumina production, Hungary's smelting capacity is relatively small, since most of Hungary's domestic aluminum requirements are met through imports from COMECON under long-term agreements. The majority, 65%, is received from the U.S.S.R.

The domestic consumption of aluminum products has increased to 155,000 metric tons in 1978, compared with 143,000 tons in 1977. In 1978, 50% of total aluminum production was used domestically and 50% was exported[18]

In 1978, investments in alumina production decreased but almost doubled in primary smelting. The breakdown of the 1978 expenditures are as follows: Bauxite mining 4.7% (4.1% in 1977), alumina production 38.1% (50% in 1977), primary smelting 16%

(8.6% in 1977), production of semimanufactures 25.6% (22% in 1977), finished products 12.6% (9.4% in 1977), and corundum 3% (5.1% in 1977).[19]

Hungary maintains trade and technical exchange relations with various countries. For example, with Hungarian participation, alumina plants have been set up in India, Romania, and Yugoslavia. Hungary provided technical aid to design and build an integrated aluminum works in Turkey; performed feasibility studies for an integrated aluminum industry in Ghana; and prospected for bauxite and planned mines in several African, Asian, and European countries. The United States is also considered a large and increasing market and the high standards of the U.S. aluminum industry offer the possibility of exchange of the more efficient technologies and joint ventures. A special group, Aluterv, was formed by MAT over 20 years ago to handle such foreign operations.

Hungary plans to significantly expand its aluminum industry over the next few years, according to Lajos Dozsa, Director of MAT. There are plans for a new 100,000-ton-per-year smelter.

In 1978, two new bauxite mines were put into operation, the Bito-2 Mine at Kincsebanya (Fejer County) and Deak Mine at Nyirad (Bakony Hills). When fully operational, the Bito-2 will mine 500,000 tons and Deak, 450,000 to 660,000 tons, of bauxite annually. The Halimba-2 mine in the Bakony Hills is the largest bauxite mine in Europe and in 1978 its capacity stood at 600,000 tons of ore annually. The Halimba-3 continued to be under development in 1979, and is expected to start production in 1981 at 1.2 million tons of ore annually. The bauxite is to be transported from this underground mine via an inclined shaft by belt conveyors.

Preliminary work has begun in the Nagyegyhaza-Many area to produce both brown coal and bauxite. The Nagyegyhaza region contains brown coal reserves of about 55 million tons, which overlie an estimated 10 million tons of bauxite. The bauxite seam varies from 10 to 20 meters in thickness. Bauxite production should get underway in 1985 at a rate of 500,000 to 750,000 tons annually. The U.S.S.R. is to provide equipment for this development.

The Hungarian bauxite long-term development program envisages 75% of deposits to be in production or developed for exploitation by 1990, on the annual output of 3 to 3.5 million tons of ore. Currently most of the bauxite produced comes from the Bakony mines (Bakony Bauxite Mining Company). Most of the new output, however, will come from Kincesbanya mines in the Fejer Count (Fejer County Bauxite Mining Company), which eventually will become the leading ore producer. The group now includes two producing underground mines and a third underground mine under development; there is also a small open pit.

The expansion of the annual capacity of the Ajka alumina plant by 80,000 tons was one of the more important Hungarian projects in 1978 and, in 1978; the expansion was also completed of the Almasfuzito alumina works by 40,000 tons annually, thus reaching an annual capacity of 325,000 tons.[20] According to the Hungarian development plan, the output of alumina is to increase gradually to 1 million tons.

While Hungary was at the top of the European list in bauxite mining, the country's aluminum output amounted to only approximately 1.2% of total European production. Thus, there existed a great discrepancy between raw material production and the more profitable processing of ore. The main reason for this is that Hungarian aluminum metallurgy is not sufficiently up to date; the average age of smelters is 30 to 40 years. Bauxite in 1978 and 1979 was plentiful and alumina plants could easily keep up with demand if the smelters had been sufficiently modernized. Another reason why Hungarian aluminum industry wishes to expand its smelter capacity is the existing unprofitable Hungarian-Soviet aluminum exchange agreement.

In 1978 and 1979, the production of semimanufactures was being expanded at the Szekesfehervar light Metal Works. Among other items, the annual output of rolled stock was to be raised by 43,000 tons and the output of pressed and extruded items is to increase by 21,000 tons. The two hot- and two cold-rolling mills at the Szekesfehervar works were built by the U.S.S.R. The renovation is to cost an estimated Ft6 billion. In addition, Ft240 million was invested into the Kobanya light Metal Works, resulting in a 6,200 ton annual increase of aluminum foil production to be operational soon.

In 1978, a joint venture agreement was signed in Budapest with the U.S. firm Pressure Castings Corporation. A castings plant is to be built at Ajka by the United States and the products are to be marketed jointly in the Western countries. The designed annual capacity of the foundry is 3,000 tons and it is to become operational in 1980.[21]

Copper.—The production of copper concentrate dropped by over 53% in 1978 compared with the previous year, and domestic mining in 1979 almost came to a standstill. Work continued at the newly developed Recsk copper mine, however. Hungary plans to eventually build a concentrator at the mine that would be able to process 5 million tons of ore annually. The Hungarians are seeking outside investments in the Recsk mine and are optimistic about their copper industry's prospects over the next 10 years. The Recsk deposit is thought to be among the world's largest, with the average copper content of 1.3%.

In 1978, a new copper wire plant was reportedly put into operation at the Gsepel metallurgical enterprise. The plant is to produce 30,000 to 40,000 tons of wire annually by 1980, when it will reach planned capacity. Some 20,000 tons of the wire is to be exported to market economy countries.

Gold.—The country's only gold mine is still in operation at Recsk but its output has been decreasing steadily. The turnover in gold jewelry in 1979 rose by some estimates by 15%, to Ft3 billion, compared with an average 5% growth in 1978. The price of 14-carat gold jewelry was raised by 10% in January and by 30% in November 1979. More than 8 kilograms of gold is to be recovered in 1980 from scrap at the United Incandescent Lamp Enterprise (Tungstram). Most of the scrap derives from semiconductors and radio parts which require gold alloy.

Iron Ore.—Hungary's production of iron ore, mostly sideritic, meets only 10% to 12% of domestic requirements; the U.S.S.R. was the major supplier of the iron ore. Mining at Rudabanya has now been leveling off for a number of years. In 1979, a long-term trade protocol was signed with India for the import of iron ore and ferroalloys in exchange for the Hungarian chemical fertilizers.

Iron and Steel.—Hungary, in 1978, reportedly invested Ft7 billion on the modernization of its metallurgical industry. Even though some of the iron and steel plants were modernized, the production fell short of the targets. The production shortfalls of pig iron were partly due to the blast furnace repairs at Lenin Metallurgical Works (at Diosgyor). At Ozd Works, where similar repairs have been completed, output was up but remained less than planned. The overhaul of the Ozd steelmaking plant also affected the output of steel. The output of rolled products by the Lenin Works proceeded as planned but the Danube Works (at Dunaujvaros) suffered a set-back due to supply difficulties.[22] Hungary in 1980 aims to produce 4 million tons of rolled steel products. The new Hungarian 5-year plan begins in 1981 and in this period a production target of 5 million tons of raw steel annually has been set. Owing to the projected moderate increase in consumption, export of rolled stock to the market economy countries is expected to grow. No major new investment projects will be started in 1980 but those in progress, such as the Danube and Lenin Works are to be continued.

Among the expansion underway in 1978-79 was the installation of an electric furnace at the Lenin Works, and plans were drafted for the replacement of the existing open hearths with oxygen converters. The Lenin Works also has long-term plans for a 1,000-cubic-meter blast furnace to replace the existing two 450-ton-per-day ones. According to R. Herendi, Deputy Manager of the Lenin Works, the new converter will be operational in 1980, producing a record of 1,030,000 tons of steel annually.

Work progressed at the Daube Works and the first converter is expected to be installed in 1981 and the second in 1982. Steel output is expected to reach 1.8 million tons at that time. The renovation is being carried out by 1,800 workers from Ganz-Mavag, with the aid of Polish specialists. At least 8,000 tons of stainless steel was produced at Danube in 1979 and, by 1980, five different types of special steels will be produced for the first time for domestic consumption.

Lead and Zinc.—No significant changes occurred during the 1978-79 period in the Hungarian lead and zinc industry. The only sizable lead-zinc mine at Gyongyosoroszi in Matra mountains produced 2,000 tons of lead concentrate and 5,000 tons of zinc concentrate in 1978, registering a decline from the previous year.

Manganese.—Most of Hungary's manganese ore is of the carbonate type and is aimed in the Western part of the country at Urkut. Smaller deposits also occur at Eger-Demjen area, approximately 110 kilometers northeast of Budapest. Some of the ore and concentrate are imported from the U.S.S.R. and various smaller amounts are exported to Poland and Czechoslovakia. Reportedly, in 1978, new reserves have been located in the Urkut area, mostly low grade (16% to 18% Mn) carbonate type.[23]

NONMETALS

Hungary satisfies its demand for most nonmetallic mineral requirements and even exports considerable quantities of perlite, glass sand, and bentonite. The output of bentonite and glass sand continued to increase in 1978-79. Most of the perlite was exported to the Federal Republic of Germany, Austria, Switzerland, Yugoslavia, and Czechoslovakia.

Cement.—Hungary in 1978-79 became more self-sufficient in its cement requirements. Because of the start-up of new facilities, production went up. The newest cement plant to start operation in 1979 was at Belapatfalva, at a planned production capacity of over 1.25 million tons annually. Another plant, at Hejocsaba, has been renovated at a projected capacity of 1.6 million tons annually. The equipment and machinery for the new plant were purchased from a West German firm, Palysius[24] The quarterly production of cement in Hungary varies; about 45% of it is produced in the first and fourth quarters, and about 55% in the second and third quarters.[25]

Clays.—Hungary has a well established bentonite production industry, with sufficient reserves to insure its availability for many years. The output of raw and processed bentonite in 1978-79 continued its steady increase, with new mining areas being opened at Ond and Istenmezeje. About 15% of the crude clay is exported annually, usually to the German Democratic Republic and Poland.

No significant changes occurred in the production of kaolin in the 1978-79 period. To supplement domestic consumption, processed kaolin continued to be imported from the eastern European countries, with smaller quantities of raw kaolin being exported to the same countries.

A new diatomaceous earth calcination plant has been put into production in 1979 at Erdobenye by the Hungarian Ore and Mineral Mines. New reserves were also located in that area.[26]

Fertilizer Materials.—Hungary has a stable fertilizer-manufacturing industry and especially a well established ammonia production sector. The anhydrous ammonia is even exported to various eastern European countries. All of the crude phosphate and potassium, however, are imported, primarily from the U.S.S.R. In 1978-79, almost 85% of the nitrogenous fertilizer was manufactured domestically, as was 55% of the phosphatic. Much of the supplementary nitrogenous and phosphatic fertilizers were imported from the U.S.S.R. In 1979, about 1.5 million tons of chemical fertilizers were used domestically and 1.7 million tons are to be used in 1980.

The Hungarian chemical industry, in general, envisions a 6.9% growth in 1980, even though the investments will be 12% less than in 1979. Of the manufactured fertilizers, 260,000 tons of phosphate (in nutrient content) are to be produced. The U.S.S.R., the largest exporter of fertilizer materials to Hungary, is to supply about 60% of its domestic requirements, including raw phosphate and manufactured potassic, nitrogenous, phosphorus, and ammonia phosphate fertilizers.

Reportedly, work started in 1978 on a new phosphate plant for Tisza Chemical Works at Szoluok in central Hungary. Assembly work is expected to take just over a year and test runs were scheduled for 1979. Depending on the success of the tests, the French firm Prorea will supply the machinery at a cost of FT782.2 million.[27] The refurbishment program of the Pet Nitrogen Fertilizer Plant was reportedly completed and production started in early 1979. The Kazincbarcika Ammonia Plant of the Borsod Chemical Complex was also reportedly nearing reconstruction completion in 1978.

Perlite.—Hungary in 1978-79 continued to be a leading producer and exporter of perlite. There were no significant changes in the perlite industry during this period and because of plentiful reserves a steady output is insured for many years to come.

MINERAL FUELS

Over 51% of the country's energy requirements in 1978-79 were imported. In spite of conservation programs, however, the forthcoming sixth 5-year plan is expected to provide for an increase in energy requirements equivalent to about 5 million tons of crude oil by 1985. About one-half of this additional demand is to be covered by nuclear energy from the new plant at Paks.[28] Because of depletion of domestic crude oil reserves, some official estimates project Hungary's imports of energy requirements by 1980 at 58%, in spite of the expected price increases. The U.S.S.R. accounts for over 40% of Hungarian energy imports. Because of the completion in 1979 of the Orenburg gas pipeline and of the Vinnitsa-Albertirsa electricity transmission line, the energy imports from the U.S.S.R. increased considerably. In addition, the Adria oil pipeline was nearing completion in 1979. The total energy balance for 1978 and 1979 is shown in table 4.

Table 4.—Hungary: Primary energy balance for 1978 and 1979

(Million tons of standard coal equivalent[1])

Year	Total primary energy	Coal (lignite, anthracite, bituminous), coke, and briquets	Crude oil and petroleum products	Natural and associated gas	Fuelwood	Hydro-electric and other power
1978:						
Production	27.7	14.3	3.2	9.8	0.4	--
Imports	22.9	2.9	17.8	1.6	--	0.6
Exports	3.1	.02	3.1	.03	--	--
Apparent consumption	47.5	17.2	17.9	11.4	.4	.6
1979:						
Production	26.4	14.4	2.9	8.6	.5	--
Imports	26.0	2.8	17.5	5.0	--	.7
Exports	2.5	.02	2.5	.03	--	--
Apparent consumption	49.9	17.18	17.9	13.63	.5	.7

[1]1 ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are: Hard coal, 1.0; lignite and brown coal, 0.5; briquets 0.67; coke, 0.9; crude oil, 1.47; refinery products, 1.53; natural gas, 1.33 (per thousand cubic meters); manufactured gas, 0.6; and hydroelectric power, 0.125 (per thousand kilowatt-hours).

Coal.—In spite of tremendous efforts, the output of coal in 1978-79 registered only marginal increases. Furthermore, the geological conditions and the access to coal seams have become such that more overburden has to be removed for the mining of a lesser quality of coal. New Pliocene lignite deposits have been discovered in northern Hungary, which are an extension of the lignite fields between Gyongyos and Fuzesabony. Deposits of high-quality coal are reported to have been discovered also in Hungary's northern Mecsek mountains. The coal's calorific value is estimated to be 150 calories higher than that of the neighboring Komlo mines. The existing Mecsek mines, in southern Hungary, is the only area in the country producing coking coal. New coal deposits were reportedly discovered also in the Borsod County, already a large producer of coal. The reserves are sufficient for more than 100 years and are to supply 5 million tons of coal anually.

In 1978, reportedly over Ft1 billion has been allocated for coal mine modernization.

By 1990, of the 54 mines now operating, only 31 will remain open under the Eocene Program. Some of the open pit operations will be replaced by four underground mines, with a planned total annual production of 8 million tons. The present 8 million tons of output from the Visonta open pit operation is also to increase gradually by 28%. In spite of this, however, the expanding rate of energy consumption is projected to be such that only 35% of Hungary's total energy demand will be covered by coal. In 1978-79, some 80% of coal production was used for the generation of electricity, using up approximately 17 million tons of coal, 7 million tons of which came from the Visonta open pit and the rest from underground mines.

The 12 mines at Borsod planned to produce over 5 million tons of coal in 1978, with the production in the future to remain at the same level due to closure of 3 smaller mines. The Juko mine of Borsod is to extract 1.25 million tons of lignite in 1980 and to transport it through pipeline. This is the first such installation in Hungary and will cost Ft200 million. Work began in 1979 on the development of a mine at Many, in northern Transdanubia, as part of the Eocene Program. The other two mines to be developed under this program are at Markudsgy and Negyesyhaza. The mines are expected to become operative in 1981-82, with a joint capacity of over 9 million tons of lignite anually.

An explosion in 1978 at Tatabanya slowed the production somewhat to 2.4 million tons. The accident in the 12-A pit was caused by the explosion of methane gas. Twenty-six miners were killed by the explosion, the collapse of the shaft, and the accumulation of carbon monoxide. Following the accident, in 1979 the Mecsek coal-mining enterprise initiated a study for the prevention of gas explosions in mines. It will begin at the Zobak mine. A rock fall in 1979 in the 7-A shaft also at Tatabanya buried four miners, two of whom were rescued. In 1979, the No. 6 Mine at Tatabanya was closed due to depletion of reserves. During the 75 years of its operation, the mine produced 20 million tons of high-quality coal. Another accident in 1979, a cave-in at Komlb in the Beta mine of the Mecsek coalfield, caused the death of six miners.

A contract was signed in 1979 by representatives of the Hungarian Geological and Mining Engineering Co. (Geominco) with Coal Processing Consultants Ltd. (CPC), a division of Britain's National Coal Board. The contract is for the coal utilization study in which CPC will advise on the development of Hungarian brown coal and lignite deposits for potential applications in power generation and chemical production.[29]

There has been considerable cooperation between Austria and Hungary in energy supply since 1968. The two countries currently exchange 250,000,000 kilowatt-hours per year: In winter, when the mountain rivers supplying Austrian power stations are frozen, the Hungarians sell power to the Austrians; in summer, the Austrians provide for the Hungarians. There is also reciprocal support in the case of breakdowns. This close cooperation is now to be considerably expanded. Following an initial agreement in November 1979, plans have been announced for the sale of Hungarian lignite to Austria. In the neighborhood of Torony, a village west of Szombathely and close to the Austrian border, there is a lignite field of rather poor quality (averaging 1,800 kilocalories per ton) estimated at 600,000,000 tons. One-sixth of the field is on Austrian soil. According to the plan drawn up by Hungarian and Austrian energy specialists, the lignite will be strip-mined and transported to Austria on a 2- 2.5-kilometer belt conveyor in order to fuel a 600-megawatt Austrian power station which is being built. According to an earlier report, the lignite from Torony will be sufficient to guarantee fuel for the Austrian powerplant for the next 40 years. The project will be the largest yet undertaken between the two countries. According to Hungarian reports, about US 200 million is being spent on the development of the mine. Austrian Finance Minister Hannes Anrosch has reportedly offered the Hungarians $150 to $160 million in project-tied credits to develop the mine.[30]

Natural Gas.—Hungary, in 1978-79, consumed over 10 billion cubic meters of natural gas annually. Approximately 73% of the gas was produced domestically, the balance being imported from the U.S.S.R. and Romania. Over 27% of Hungary's energy requirements are met through the utilization of gas. In 1978-79, no new reserves of natural gas were discovered, but in the 1981-1985 period, 25% of production is to come from the fields discovered in 1977.

The Orenburg gas pipeline was completed in 1979, thus surging the gas supply from the U.S.S.R. to 134 billion cubic feet in 1980, which is 3 times the 1978 level. Natural gas imports are to amount to 40% of domestic consumption.[31] In order to accommodate the additional gas import, construction of a gas storage facility has begun at Hajduszoboszlo. Over Ft800 million will be spent on the construction of 35 storage tanks. Another project at Bekes County was in progress in 1978, for the conversion of a depleted gas reservoir at Kardoskut into a natural gas storage facility, with a planned capacity of over 5 billion cubic feet. The conversion is to cost Ft130 million and was to be completed in May of 1978.

Petroleum.—The production of crude oil continued to remain at the same level in 1978-79 and imports, mostly from the U.S.S.R., and some from Iraq, made up almost 93% of consumption in 1978. Hungary continued to export more refined products than it produced, supplementing the exports and domestic requirements with imports.

Most of Hungary's crude oil was recovered from the Szeged-Algyo oilfield, as in previous years. Seismic exploration has not uncovered any new reserves to date. The previously discovered oilfield in the Kiskunhalas district, however, became operational in 1978. According to estimates, this field will supply 20% of the country's total oil production on reaching full capacity.[32] For all practical reasons, geological exploration for gas and oil has ceased in Hungary, owing to poor geologic conditions. The proven oil reserves, at present level production, may last only for a few more years. However, some of the country's potential hydrocarbon resources remain to be discovered, Great Alfold (plain), also the source area of most of the present production.

In 1979 the Hungarian Oil and Gas Trust put into operation eight inclined wells located directly underneath the town of Szeged, the center of the Hungarian oil- and gas-bearing region. Once this program is fulfilled, 22 inclined wells are expected to pump crude oil from as deep as 2,700 meters; the 1979yield was originally set at 180,000 tons.[33]

Hungary's consumption of petroleum products was in the range of 52 million barrels in 1978. In order to expand its refining capacity, production began in 1979 at the new Tisza crude oil refinery at Leninvaros. The plant is capable of refining 3 million tons of crude oil annually and is to supply the Lefin plant with derivatives for the chemical industry and the Tisza thermal power station with heating oil. With the receipt of 8.5 million tons of crude oil through the Friendship pipeline from the U.S.S.R., the four Hungarian refineries plan to produce almost 11 million tons of processed products in 1980. Of this total, 7.4 million will be refined in Szazhalombatta, 1.8 million in Lenin City (Tisza refinery), 1.2 million in Szony, and 200,000 tons in the Zala refinery.

Work continued in 1979 on construction of the Adriatic oil pipeline, scheduled for completion in 1980. A joint project with Czechoslovakia and Yugoslavia, Hungary is slated to receive some 5 million tons of crude oil via the pipeline from the Middle East and North Africa.

Uranium.—It appears that development of the No. 5 uranium mine in the Mecsek mountains neared completion at the end of 1978. The uranium in Hungary occurs in Permian sandstones, at depths of up to 1,000 meters. The source beds are about 500 meters thick and also contain vanadium. The U, Cr, and V content of the sandstone varies greatly, ranging from 0.008% to 0.15% U_3O_8, 0.16% to 3% Cr_2O_3 and 0.03% to 0.8% V. According to some reports, more than several hundred tons of U_3O_8 is mined from one Pecs mine in the Mecsek mountains. Reasonably assured Hungarian reserves of uranium are calculated at 5,000 to 10,000 tons and estimated reserves at 15,000 to 30,000 tons.

The only Hungarian nuclear powerplant at Paks was nearing completion in 1979 and the first of four units is scheduled for operation in 1980. Reportedly, Ft7 billion was spend in 1979 on the Paks project, a record for any single project in 1 year.

The Mineral Industry of Iceland

By Joseph B. Huvos[1]

In 1978-79, the Icelandic economy grew at a rate of 3.7%, despite a high inflation rate. The country's foreign trade balance, adversely affected by increasing oil prices, may be balanced soon by new exports of ferrosilicon. In February, 1978 the Central Bank of Iceland devalued the Krona by 13%, and steps were taken to exchange 100 Kronas to one new Krona.

Unemployment was 0.6%. The gross national product (GNP) was about $2.1 billion.[2] The mineral industry's chief contributions to the national economy continued to be inexpensive hydroelectric power, geothermal energy, aluminum, and some nonmetallic minerals.

Notable events in Iceland's mineral industry included announcement of plans to increase the capacity of the Alusuisse aluminum plant, commissioning of Icelandic Alloy's ferroalloy plant, continued development of geothermal and hydropower, and exploration for oil on Iceland's continental shelf.

PRODUCTION

Primary aluminum and modest quantities of cement, diatomite, ammonia, and pumice were the only mineral products of Iceland, shown for 1977, 1978, and 1979 in table 1.

Table 1.—Iceland: Production of mineral commodities

Commodity and unit of measure	1976	1977	1978[p]	1979[e]
Aluminum metal, primary ---------- metric tons	65,300	74,245	73,800	[1]72,145
Cement, hydraulic ---------- thousand metric tons	145	139	133	135
Diatomite[2] ---------- metric tons	22,699	20,985	20,020	20,000

TRADE

In 1978 and 1979, there was no significant change in Icelands modest foreign mineral trade. Total mineral trade in Iceland is shown in table 2.

Table 2.—Iceland: Foreign trade in mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978
EXPORTS		
Aluminum metal including alloys, unwrought	74,245	77,349
Diatomite	20,985	20,020
Iron and steel scrap	2,224	8,842
Nonferrous metal scrap and metal-bearing residues	456	407
Pumice	7,586	8,497
IMPORTS		
METALS		
Aluminum:

COMMODITY REVIEW

METALS

Aluminum.—Plans were announced by Alusuisse to expand the capacity of the company's Straumsvik reduction plant, located south of Reykjavik, from 75,000 tons to 85,000 tons per year. Forty pots have to be added to the existing 280 pots. Work on the expansion started in March 1979 and is to be completed in 1980. In 1978, the reduction plant operated at 98.5% of its nominal capacity. Alusuisse controlled the plant through Icelandic Aluminum Co. Ltd., a wholly owned subsidiary.

Ferroalloys.—Production started in spring 1979 at Icelandic Alloy's 50,000-ton-per-year ferrosilicon plant on the north shore of Hvalfjordur near Grundartangi. Icelandic Alloys is jointly owned by the Icelandic state and Elkem Spigerverket of Norway, with the former holding the controlling interest. According to plans, only the first of two 40-megawatt furnaces began operating. Full production is expected to start in September 1980.

About 200,000 tons of raw material is to be imported each year for the plant, and ferrosilicon produced is to be exported, using Icelandic-owned vessels. In 1978, the Icelandic Government was considering a temporary slowdown of the project with the purpose of decreasing inflation.

MINERAL FUELS

In 1978-79, hydroelectric and geothermal power continued to supply the smaller half of the country's energy needs. The remainder was mainly petroleum products imported from the U.S.S.R. and various western sources.

Geothermal Power.—In November 1978, the shaft of steamwell No. 11 of the National Energy Authority's Krafla geothermal project (northeast Iceland) was lined for tapping superheated water from strata below 1,200 meters. If a total of four wells can become operational, the geothermal powerplant can be started at the level of 5 megawatts. Delays in starting the powerplant were caused by earthquakes that damaged the plant's existing steam wells.

By 1978, about half of all houses in Akureyri, northern Iceland, were hooked up to municipal geothermal heating systems; in 1980, all remaining houses are to be connected to the system. Work continued in the Keflavik area, near Grindarvik, southwest Iceland, at the Sudurnes low-temperature geothermal powerplant and feeder lines, where the airport is also to be supplied with geothermal heat after 1980.

Installed geothermal capacity in Iceland increased by about 50% over the last 4 years to 520 megawatts. Tapped mostly thus far are numerous so-called low-temperature areas for water used in municipal heating systems. Geothermal steam provides the energy at Grindarvik. The only major attempt to harness a high-temperature geothermal site for generating electricity is the Krafla project in northern Iceland.

Hydroelectric Power.—The National Power Company of Iceland, in agreement with the Ministry of Industry and Energy, has decided to review the construction schedule of the Hrauneyjafoss hydroelectric powerplant, the third in the Thorsa River basin of the south-central region. The National Power Company of Iceland is jointly owned by the state and the city of Reykjavik, and supplies 70% of Iceland's population, the aluminum smelter at Straumsvik, and the ferrosilicon plant at Grundartangi.

In order to curb inflation, the Government wanted to trim investment, including that for hydroelectric power. Work at Hrauneyjafoss started in 1978, and the plant, which is scheduled to go online at half capacity in 1981, is to be completed 1 year later than planned. A 140-kilometer section of the National Power Grid was inaugurated during the year forming a link between the central-west, north, and south Icelandic power lines. When completed within 10 years, the national power grid system is to completely encircle Iceland.

Petroleum.—Geophysical search for offshore oil was started in November 1978 north and northwest of Iceland. This project was undertaken by the Western Geophysical Corporation, an England-based U.S. research organization, which, besides paying a fee to the Icelandic Government, will underwrite the entire cost. The Ministry of Industry of Iceland will participate as an observer in the search and its evaluation.

Iceland had no crude oil production or oil refinery and imported each year over 600,000 tons of petroleum products from the U.S.S.R. and Western Europe.

The Mineral Industry of India

By Gordon L. Kinney[1] and Francis E. Shafer[2]

The mineral industry of India was an important factor to the economy. It accounted for about 1.5% of India's gross national product (GNP) in 1978 and employed about 4% of the organized labor force. Downstream employment depending directly on domestic mineral output was several times that figure, and included the steel, aluminum, copper, and zinc producers and their associated heavy manufacturing, transportation, and rural electric power development sectors.

Continuing exploration efforts conducted or supported by the Government-owned Geological Survey of India (GSI), Mineral Exploration Corp. (MEC), National Mineral Development Corp. (NMDC), Oil and Natural Gas Commission (ONGC), and the various State mineral development corporations, added significantly to the mineral reserves picture of the country. India has large proved and indicated reserves of bauxite, iron ore, mica, manganese, chromite, barite, heavy mineral sands, and coal. Offshore exploration drilling during 1978-79 confirmed additional reserves of petroleum and natural gas.

In December 1978 there were approximately 2,100 active nonfuel mines in India that were large enough to be required to report to the Government. Nearly 500 were producers of 10 different metallic ores and the remainder produced a total of 36 different nonmetallic minerals.

Overall, the private sector employed over 120,000 persons in mining, while the public sector accounted for over 760,000.[3]

The Indian economy had a relatively good year in 1978. The GNP increased approximately 4.0% in 1978-79[4] to $66.4 billion.[5] Conditions took a turn for the worse, however, in 1979 and the GNP was expected to decline about 3% in 1979-80 to about $64.4 billion.[6] At current prices the GNP was $109 billion in 1977-78, $117 billion in 1978-79, and estimated at $131 billion in 1979-80.[7] The poor performance of the economy during 1979 was caused by several factors. The most important was the lower than normal rainfall in the southwest which brought drought conditions to much of the country and a large decrease in the amount of power normally generated by the hydroelectric plants. The food grain harvest in 1979 was estimated at 16 million tons less than in the previous record high year. Other factors affecting the economy were the loss of industrial production from severe electric power shortages, scarcity of industrial raw materials, transportation and port bottlenecks, and labor unrest.

The $1.7 billion budget deficit initially projected in February 1979 climbed during the year and almost doubled to $3.3 billion. Drought relief and welfare expenditures, cost-of-living allowances for government employees and increased cost of crude oil were the major contributors to the expanding deficit.

A sharp inflationary trend developed early in 1979 and continued through the summer. Prices were driven upward by the projected budget deficit; a sharp increase in the money supply; increased taxes; higher cement, steel, and petroleum prices; and anticipation of a poor harvest following the lower than normal rainfall. Wholesale prices were increasing at a 25% annual rate in March 1979, then settled down and finished with a net increase of about 16.4% for 1979-80.

In 1979-80, for the first time in recent years, India's industrial production growth rate was zero, compared with a 7.6% increase in 1978-79.

Production of electric power totaled 103 billion kilowatt-hours in 1978-79, a 12% increase over the 92 billion kilowatt-hours reported for 1977-78. The increase was a nominal 1% to 104.3 billion kilowatt-hours in 1979-80. The installed generating capacity was increased from 25,800 megawatts in 1977, to 28,800 megawatts in 1978, and an additional 3,200 megawatts were scheduled for completion in 1979-80.[8]

Despite the substantial and expensive capacity gains, the power industry has not kept up with the even more rapidly increasing demands from industry and agriculture. Most of India has been experiencing a chronic and often worsening shortage of electric power over the last few years which has been a major constraint on the utilization of India's mining, industrial, and agricultural capacity. The most seriously affected industries were aluminum, cement, fertilizer, iron and steel, and petrochemicals.

In 1979 the drought's effect on the hydroelectric power output was but one exacerbating factor in the power shortages. Water in most reservoirs was well below normal levels in 1979. Among the hardest hit areas was the industrial belt of Bihar and West Bengal where most of the country's coal mines, steel plants, and heavy industry are concentrated. Also experiencing economically disruptive power cutbacks were Maha rashtra, Haryana, Punjab, and Uttar Pradesh. The loss of hydroelectrically generated power threw the load on the already overtaxed thermal powerplants.

The thermal power shortages stem from an excessively low capacity utilization factor, 51.5% in 1977-78, 48.6% in 1978-79, and 45.0% in 1979-80.[9] The current power deficit is estimated at about 16% for the country as a whole and is much higher in the eastern and northeastern regions. This situation was caused by a variety of interrelated factors including poor quality coal, equipment maintenance problems, and powerplant design and construction deficiencies; railroad transport bottlenecks; and failure to produce sufficient quantities of coal.

In the east some of the worst power shortages were occurring in the coal mines themselves. Cutoff or reduction of power to the water pumps and ventilation equipment caused dewatering problems and the danger of gas explosions, thereby frequently closing down the very source of fuel on which the powerplants were dependent. This no-win spiral was often compounded by shortages of railroad cars and inefficiency in moving and loading them.

The direct loss of industrial producton to power stoppages during 1979 was estimated by independent sources at over $9 billion, and the overall loss to the economy, particularly during 1979, certainly must have cost several percentage points on the GNP.

PRODUCTION

The total value of mineral production during 1978 was $1.67 billion compared with $1.57 billion in 1977. Mineral fuels constituted the leading group with $1,318 million or 79%, metallic minerals $225 million or 13%, and nonmetallic minerals $131 million or 8% of the total value. Coal and lignite contributed 54% of the value followed by petroleum and natural gas 25%; iron ore 7%; limestone 4%; copper 2%; and phosphate rock, manganese ore, gold, chromite, and zinc ore with 1% each.

Production of coal was nearly static despite a large planned increase and serious widespread shortages. Petroleum output continued to climb at an impressive rate. However, consumption increased even faster, forcing a large increase in the petroleum import bill.

The value of metallic mineral production declined slightly in 1978. All of the major metal ores except bauxite, lead, zinc, and the rare-earth metals recorded lower output value compared with 1977. The value of nonmetallic mineral production dropped moderately compared with 1977, although several of the important ones, including phosphate rock, barite, graphite, gypsum, and magnesite, did record higher outputs.

Geographically, five States accounted for about 70% of the total value of mineral production. These were Bihar with 27%; Madhya Pradesh, 14%; West Bengal, 11%; and Gujarat and Assam with about 9% each.

Nearly all of Gujarat's and Assam's values were from petroleum and natural gas, while Bihar produced mostly coal, iron ore, copper ore, and bauxite.

It was interesting to note that the mineral production value from the offshore Bombay High oil and gasfields doubled between 1977 and 1978 and had climbed to sixth ranking after Assam State. A large production increase planned for the offshore oilfields in 1979 will probably move the offshore output into third or even second ranking behind Bihar. According to the current expansion plans, production from the offshore area by 1983 will be at a level where its value will put it first in geographic ranking and economic importance.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed, bromine, other clays (bentonite, fuller's earth, and common clays), other gem stones (aquamarine, ruby, and spinel), and uranium are also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels. In 1975, production of 6,514 tons of uranium ore containing about 3 tons of U_3O_8 was reported from two mines, which was only a part of total national production.
[2]Reported figure.
[3]Data are for fiscal years beginning Apr. 1 of that stated.
[4]Includes reinjected gas.

TRADE

According to provisional trade data, exports during fiscal year (FY) 1979-80 totaled $7.3 billion while imports were valued at $10.0 billion, resulting in a deficit of $2.7 billion compared with a deficit of $1.3 billion in FY1978-79 and $0.8 billion in FY 1977-78. This sharp rise in the trade deficit led to a lowering in the current account position which was reflected in a decline of $68 million in foreign exchange reserves in FY1979-80 compared with an increase of $1,130 million in FY1978-79.

India's exports rose by only 5.9% in FY1978-79 and about 7.4% in FY1979-80. This was a sluggish performance compared with the 27% average annual increase in the 4 previous years.

Of the $6.98 billion total exports in FY1978-79, the major mineral or mineral-related commodities included gem stones and jewelry, $867 million; iron ore, $284 million; steel, $140 million; silver, $115 million; mica, $23 million; and manganese ore, $19 million.[10] The major export market for the gems and jewelry were Belgium, Hong Kong, Japan, the United Kingdom, and the United States. Iron ore, the second ranking export mineral, went principally to Japan (about 64%), Romania, South Korea, and Iraq.

Mineral imports were dominated by petroleum in 1978-79 and the proportion of petroleum to total imports increased substantially both years. As a result of larger quantities and higher prices for fuels, India's bill in 1979 was estimated at $3.5

billion representing a 75% increase over the previous year. India's petroleum import bill could rise to around $4.6 billion in 1980, and equal to about 50% of the total value of exports. Iran dropped from first to third place as a supplier of crude oil in India in 1979. Iraq became the major supplier, with 6.5 million tons and Saudi Arabia in second place with 3.0 million tons.

Other major mineral imports were iron and steel, precious and semiprecious stones, fertilizers, and nonferrous metals, in that order. The relatively large increases in receipts of each of these categories, except the gems, were a direct result of domestic production shortfalls caused by the electric power, coal, and tranport problems. The rough gems were imported mainly from Switzerland and London for cutting and polishing and later reexport.

COMMODITY REVIEW

METALS

Bauxite, Alumina, Aluminum.—Indian bauxite production rose for the fourth consecutive year in 1978 but probably showed a small decrease for 1979. Over 60% of this production came from the States of Bihar and Madhya Pradesh with most of the remainder coming from States bordering Madhya Pradesh. A marked change in this production pattern is expected if three new export-oriented alumina plants proposed for Andhra Pradesh, Orissa, and Gujarat come into production in the 1980's.

Bauxite was produced at 67 active mines, 15 were captive mines of the aluminum companies with 3 in the public sector and 12 in the private sector. Of the 52 noncaptive mines, only 2 were in the public sector. Nearly 75% of the bauxite production was consumed by the aluminum industry. The balance was used by the chemical, refractory, abrasives, cement, and steel industries. A small amount of bauxite was exported.

Present estimates place India's bauxite reserves, fifth in the world, at 2,300 million tons or about 10% of world reserves. Nearly 75%, or about 1,700 million tons are located along the east coast in Orissa and Andhra Pradesh. Most of the remainder are found in Madhya Pradesh, Gujarat, and Maharashtra.

According to GSI, the east coast deposits alone could be as high as 3.0 billion tons. They are rich in gibbsite and low in silica. Steps were underway to classify known deposits by grade and to explore additional areas.

Alumina production made a modest gain in 1978 then lost most of the gain in 1979 because of the power shortages at the smelters. However, a large increase in production is anticipated over the next decade should the three proposed export-oriented alumina plants become a reality. The public-sector Bharat Aluminum Co. (BALCO) is considering setting up two east coast aluminum plants, one in Koraput District in Orissa and one in Visakhapatnam District in Andhra Pradesh. Detailed feasibility reports on each project were submitted by experts from France and the Soviet Union. Although these recommended establishment of plants, no major investment decision was likely before the beginning of the new year. The French report recommended establishment initially of an 800,000-ton-per-year alumina plant, a 220,000-ton-per-year aluminum smelter, a 600-to-800-megawatt captive powerplant, and an 80,000-ton-per-year caustic soda plant. Cost of the project was estimated between $1.0 and $1.5 billion. Inclusion of the captive powerplant and a guaranteed coal supply are mandatory, considering the electric power situation, if the plant is to be economically viable. Ore would be supplied by mining the 360-million-ton Panchpatmali deposit. The plant would be built at Damonjodi, 23 kilometers from Koraput. The project must be reviewed and passed by several government groups, then by the Public Investment Board and, finally, by the Cabinet before work can begin. The French firm Pechiney Ugine Kuhlmann, which did the feasibility study for the project, has the inside track on getting the design and consultants' contract when the plant is approved.

Plans for the U.S.S.R.-backed 600,000-ton-per-year Andhra Pradesh alumina project were not as well advanced as the Orissa project. MEC began a detailed exploration of the bauxite reserves at the Jerralla deposit in Visakhapatnam District. These reserves, on which the proposed alumina plant will be based, total about 200 million tons proved ore. The Russian plan appears to be bogged down in financing and equipment supply negotiations. Government of India (GOI) prefers to manufacture and supply as much of the equipment domestically as possible. The Soviets proposal called for 100% imported components. Unlike the Orissa project, this development would not include smelting facilities.

In 1978 the GOI cleared a proposal by the Gujarat Mineral Development Corp. to retain Hungarian experts to make a detailed feasibility study for an export-oriented 300,000-ton-per-year alumina project, based on a 50-million-ton bauxite deposit in Kutch District, Gujarat. The study was being completed at yearend 1979.

Exports to date have been small and generally consist of surplus production from BALCO and Indian Aluminum Co. Ltd. (INDAL). The power shortages, however, left a larger than normal surplus and alumina exports by BALCO were nearly 75,000 tons in FY1978-79. BALCO expects to have about 50,000 tons available for export in 1979-80. INDAL exported about 15,000 tons to the U.S.S.R. in 1978.

Aluminum production in 1978 from the four aluminum companies picked up modestly over 1977. Despite this increase, capacity utilization improved only marginally from 69% in 1977 to 76% in 1978, due primarily to the electric power situation. Madras Aluminum Corp. Ltd. (MALCO) in Tamil Nadu operated at 92% of its 25,000-ton-per-year rated capacity, reflecting the relatively better power situation in southern India. BALCO, the public sector company, operated at only 34% of its 100,000-ton-per-year capacity. Fifty percent of its capacity has never operated since its completion in 1977. Hindustan Aluminum Corp. Ltd. (HINDALCO) at Renukoot operated at 66% of its 100,000-ton-per-year capacity, almost entirely off its own captive thermal powerplant.

In 1979, the general power situation worsened and production dropped back to around 1977 levels.

Total installed capacity was 321,000 tons per year for the four aluminum companies. HINDALCO plans to install a new 20,000-ton-per-year potline by FY1982-83. The long-term expansion prospects for the industry look promising in view of existing bauxite reserves and abundant labor. By the year 2000, India's capacity could reach 1 million tons per year. However, the restraining and very crucial factor remaining to be resolved is the power supply.

As industrial activity picked up during 1978, the demand for aluminum was also strong, outpacing production by a wide margin. Consumption in FY1978-79 was estimated at 240,000 tons. Demand was projected to rise to 275,000 tons in FY1979-80, 300,000 tons in FY1980-81, and 330,000 tons in FY1981-82. At least 52% of domestic demand was from the electric power industry. With the GOI giving priority to increasing demand for electric-cable-grade aluminum.

Because of the widening gap between domestic supply and demand, imports have increased considerably. Although the 1979 gap was projected at 35,000 tons, plans called for the import of about 75,000 tons, in part to rebuild inventories. Assuming that projected demand materializes, the GOI will have no alternative but to rely on expensive imports for at least the next several years. Aluminum imports through April 1979 were channeled through BALCO. However, the GOI shifted this responsibiliby on May 1 to the Minerals and Metals Trading Corp. (MMTC) because of the increased quantities of imports. Exports of aluminum have been banned since August 1977.

Aluminum prices are fully controlled by the GOI, and financial returns allowed were reportedly quite small. To compensate the producers for cost increases because of higher electricity charges, the Government allowed prices to rise on October 1, 1979. The price of electric-cable-grade ingot was raised from $1,550 per ton to $1,781 per ton and commercial grade from $1,532 per ton to $1,715 per ton.

Chromite.—The Orissa Mining Corp. (OMC) has been issued a Letter of Intent by the State of Orissa to construct a 50,000-ton-per-year charge chrome plant at a cost of approximately $33 million. Two groups have submitted bids but the contractor had not been selected at yearend 1979. The plant would be based on a feedstock of chrome ore fines and would be primarily geared for export, but about 15,000 tons per year would be diverted to the Durgapur alloy steel plant which is to be modified to accept charge chrome.

Proposals for establishing two more 50,000-ton-per-year charge chrome plants have been made. One, by the Ferroalloys Corp., based on technology developed in their own works at Garividi, will probably be approved. The second application was made by Indian Metals and Ferroalloys Ltd., also for location in Orissa. This project was in the early stages of planning.

The primary reason for the new interest in the chromite processing industry has been the changing reserves picture. Based on several years of GSI and MEC intensive field work, proved chromite reserves now total 60 million tons of over 30% Cr_2O_3 ore or roughly twice the previous estimate. About 80% of the new reserves are concentrated in the Sukinda area of Cuttack District, 10% in neighboring Dhenkanal District, and 10% in Keonjhar District of Orissa. Breakdown by grade was not yet available, but a large percentage of the new reserves was in the form of fines. The inventory by GSI and MEC was continuing at yearend 1979. When completed it was expected that the reserves figure will exceed 100 million tons. The increase in the reserves tonnage was due in large part to changing specifications of what was considered usable ore. Production of charge chrome allows a lower chromium content, lower chromium-iron ratio, and use of smaller particle sizes.

Indian chromite production, 90% of which came from the mines in Orissa, declined in value from $20 million in 1977 to $16 million in 1978. This was attributed to a slowdown in iron and steel production in the country as well as recessionary conditions in the international market which adversely affected exports. Production in 1979 was believed to have increased slightly. Chromite exports in 1978-79 were at the lowest level since 1969. The slump was attributed chiefly to a cutback in Japanese steel production which accounts for 90% of Indian chromite exports. Because of this, India has attempted to deversify its export market. During the past year some ore was shipped to Western Europe and a small amount to China on a trial basis.

According to the GOI 1979-80 Export Policy, high-grade lump ore containing 40% Cr_2O_3 or more continued to be banned for export, while concentrate produced from beneficiation of low-grade ore continued to be exempted to encourage export of low-grade chromite.

Copper.—During 1978 and 1979 copper demand outstripped production by a wide margin. Production was off substantially in 1978 then made a modest recovery in 1979. As a result of the lower production, imports of copper metal increased considerably in 1978 and their cost increased to $55 million from $31 million in 1977. India's major suppliers were Zambia with 24,000 tons followed by the Federal Republic of Germany 12,000 tons, and Tanzania 3,000 tons. For FY1978-79, MMTC which contracts for most of India's imports, reportedly contracted for 83,000 tons of copper compared with over 35,000 in the previous year. This increase was designed in part to rebuild inventories. As of March 1979, MMTC's stocks were only about 20,000 tons. Because of underutilization of capacity and continuing problems at the Khetri complex, production cost during 1978 exceeded the price of imported metal.

Production at the Khetri smelter ran below 40% of its rated capacity in both 1978 and 1979. Various problems have plagued the Khetri complex since its completion in late 1974. Latest of the troubles were a 53-day strike which closed the plant until April 20, 1978, a 4-month closing during 1978 while technical improvements were being made, and an 80-day closing beginning in August 1979 because of recurring problems with the flash smelter furnace. Compounding the smelter problems has been a lower than anticipated copper content in the ore from the mines supplying the concentrator. These have been running about 0.6% Cu instead of the 1.0% as planned.

To improve recovery and production of copper, plans call for installation of balancing facilities at both the existing smelters and upgrading of the concentrate treated at

Khetri above the present 12%.

In an effort to decrease the amount of copper imported, India was continuing with a strong exploration and development program. Foremost in the plans is the Malanjkhand project in Balaghat District of Madhya Pradesh. The project will consist of a 2-million-ton-per-year mine and a matching concentration facility. The concentrate, with a planned content of 23,000 tons per year of copper, would be shipped to Khetri for smelting and refining. Estimated cost of the project was well over $100 million. Proved reserves are 15 million tons at 1.0% Cu and estimated ore was put at 60 million tons. The project suffered delays in getting started but preliminary work and infrastructure development got underway in late 1978. Actual construction on the concentrator and open pit mine reportedly began in July 1979. The original planned startup date of October 1981 has been pushed back to FY1982-83.[11]

Iron Ore.—Iron ore production declined in 1978 for the second year in succession, again because of a drop in demand from the export market. Despite the considerable drop in tonnage the pithead values remained nearly constant at about $110 million. With a pickup in the export market in 1979, the Goan ore production did a sharp turnaround and increased over 4 million tons.[12] India remained the seventh largest iron ore producer in the world for both years and only coal and petroleum were of more value in the mineral sector.

In early 1979, the area around Goa produced over one-third of the Indian iron ore total, nearly all of it for the export market. Most of the remainder of production came from Madhya Pradesh, Orissa, and Behar where many of the integrated steel plants are located.

The 5-year plan (1978-83) calls for a production of 65 million tons by FY1982-83, reaching 77 million tons by FY1987-88. At the 1987-88 level, hematite reserves are sufficient to last about 125 years and magnetite reserves over 100 years, according to the plan. India's officially estimated iron ore reserves were put at 17 billion tons.[13] These reserves represent India's second most valuable mineral asset after coal.

MMTC accounts for about 60% of the iron ore exports each year with the remainder coming from the private mining-shipping companies of Goa. Despite recessionary conditions in the world steel market during FY1978-79, exports increased slightly over FY1977-78, but export earnings remained basically unchanged at about $297 million. The 1979-80 export earnings should be considerably higher because of new agreements reached between Japan and MMTC and Goan exporters. Japan continued to be India's main customer, with Eastern Europe, South Korea, Iraq, Taiwan, and Holland also receiving substantial amounts. China and the United Arab Emirates received Indian exports for the first time in 1978. A contract was signed in late 1979 for the sale of 300,000 tons of iron ore to the Democratic Republic of Korea. The shipments will be made in Korean ships on their return journeys from delivering cement to India. This will be the first India iron ore shipped to North Korea. At yearend 1979, Pakistan and India were negotiating the possible sale of ore to supply Pakistan's first blast furnace scheduled for completion at the end of 1980. India has a distinct advantage in lower transportation costs to Pakistan over other potential suppliers.

The new automated ore-handling facilities at Mormugao Harbor in Goa were ready to begin commercial operations in October 1979 after a 1-year period of trial operations. The previous partly manual and outdated ore-loading facilities have been a bottleneck to ore exports in the past. The new facility, which cost over $100 million, was begun in 1973 and will greatly increase the efficiency and speed of ore transfer at the Goan port. Since 90% of the ore is transported to the harbor in barges, a major part of the facility is the waterborne-ore unloading equipment. There are four barge-unloading bays, each with two 12-ton grab buckets. The sustained unloading capacity is 2,400 tons per hour. Belt conveyors move the ore through transfer houses to three surge bins. From any of the bins, the ore can be routed to stackers for stockpiling or directly to shiploading. Two traveling bucketwheel reclaimers rated at 4,000 tons per hour each are employed to provide an average sustained flow of 3,000 tons per hour at the shiploaders. Automated rotary dumper equipment was also included to handle the ore shipments delivered to the port by the 1-meter-gage railroad line. The new ore berth was designed to handle vessels up to 120,000 deadweight tons but current draft limitations at the harbor mouth limit ships to a 12-meter draft or about 60,000 tons.

During 1978-79, India's domestic iron ore consumption remained unchanged at around 16 million tons accounting for about 42% of total production. For 1979-80, domestic iron ore consumption was estimated at around 17 million tons to meet the crude steel target of about 9 million tons. That estimate could be high considering the power and coal supply problems during 1979.

The public-sector NMDC was conducting exploration and feasibility studies on selected major iron ore deposits such as Kumaraswamy B and D ore blocks and the phase II section of the Bababudan deposit in Karnataka, Ongole, in Andhra Pradesh; and Bailadila 11B/10 ore blocks in Madhya Pradesh. Exploration of the magnetite deposits at Bababudan are expected to be completed by 1980 at a cost of nearly $1 million. Likewise, exploration of the magnetite deposits at Ongole, started in 1977, were to be completed by yearend 1979 at a similar cost. The Bailadila 11B/10 hematite deposits are being investigated as a possible ore supply for the planned Visakhapatnam steel plant.[14]

Construction work on the 7.5-million-ton-per-year Kudremukh iron ore concentrate project continued on schedule during 1978 and 1979. The first load of concentrate was scheduled to be shipped to Iran in September 1980. The ore was to be made into pellets in Iran and used as feed for two direct-reduction sponge iron plants. Because of political changes in Iran, work was stopped on one of the sponge iron plants, and construction on the pellet plant and remaining steel complex was considerably delayed. Iran has been financing the project at an original cost of $630 million but reportedly made only $255 million in payments. As of yearend 1979, Iran was likely to take only 4.5 million tons per year of concentrate starting many months after Kudremukh's scheduled startup. India was reviewing a number of complex and expensive options available for utilizing the surplus production capacity. Construction of a pellet plant at Mangalore is a distinct possibility. The pellets could then be exported or shipped north where direct-reduction plants based on Bombay High natural gas could be constructed. Whatever solution is found will cost several years' delay in Kudremukh's full utilization and a great deal of additional money.

Mandovi Pellets Ltd. at Goa, India's third and largest iron ore pelletization plant, was commissioned in May 1979. The plant has a capacity of 1.8 million tons per year and is jointly owned by the Steel Authority of India Ltd. and Chowgule Co. Pvt. Ltd. The output of the plant will be exported to Japan. Chowgule Co. also operates a 0.5-million-ton-per-year pellet plant at Pali, Goa. The only other plant in India is operated by the Tata Iron and Steel Co. for its own steel mill. NMDC was negotiating for a 2.0-million-ton-per-year pellet plant to be set up at Bailadila to utilize the high percentage of fines produced at these mines. However, considering the Kudremukh situation, the plant could be located at Mangalore instead.

Iron and Steel.—India's shortage of low-ash coking coal has led to a conservative attempt at developing a sponge iron capacity based on low-quality noncoking coal. After careful consideration, the India Government has authorized construction of a 30,000-ton-per-year pilot plant near Kothagudam, Khammam District, Andhra Pradesh. The $22 million plant is based on the Lurgi SL/RN technology and is expected to be operating in 1980.

In May 1979 the Tor-Steel Research Foundation, in collaboration with the Government of Orissa and Allis Chalmers Co. (United States), was given permission to start work on the country's second plant. The $30 million plant will have a capacity of 150,000 tons per year and will be located in Keonjhar District, Orissa. It is scheduled to go onstream in 1981.

Plans were being made for additional plants which would be located along the western coast and would utilize the natural gas from the offshore fields as fuel and reductant.

Steel shortages in India remained a problem for the second year in succession. A negligible growth of Indian crude steel production against a continuation of the recent annual rise of 16% in domestic steel demand increased the steel deficit and accelerated imports of steel. Indian prices were increased 20% to 40%. There was little relief in sight from the serious shortages of coking coal and electric power which affected the last 2 years' domestic output. Imports of finished steel more than doubled in 1978 and will probably double again in 1979. India lost its status of net steel exporter in FY1978-79 after just 3 years in that status, and will continue to import more steel than it exports until the rather formidable problems are resolved.

Production of steel in various categories all showed nominal gains in both FY1977-78 and FY1978-79. The Ministry of Steel and Mines imposed an 8% production cutback in April 1979 in an effort to rebuild dangerously low coking coal stock levels and this apparently helped stabilize production output to some extent. By yearend 1979, production of crude steel ingots had recorded a small rise over the previous year but the electric power shortage in the rolling and finishing plants caused a decline in the production of salable steel at the integrated plants. In December 1978, capacity utilization hit a yearly high of 98% at Rourkela and 93% at Bhilai.[15]

Average rate of capacity utilization of salable steel by the six integrated producers fell from 81% in FY1977-78 to 77% in FY1978-79. Moreover, actual production fell short of the official production target by 18%. One of the main causes of the decline was in coal supply. Coal stocks at the steel mills were equivalent to 3 weeks' consumption in early 1977, fell to 10 days' supply in early 1978, and 2 to 4 days' supply in early 1979. The more than 20% ash content of the coal also hurt the blast furnace operations. Flooding in West Bengal in September 1978 affected production at the Durgapur and India Iron and Steel Co. mills. The omnipresent power problem was being solved in part by a direct approach. GOI approved construction of five captive 60-megawatt thermal power generators. Three will be installed at Bokaro and two at Durgapur.

What production gains there were in 1978 and 1979 were attributed mainly to the additional output of the mini-steel mills, which represent an aggregate of about 25% of national capacity. The 108 operating electric furnace mills in the private sector increased crude steel production from 1.0 million tons in FY1977-78 to 1.5 million tons in FY1978-79. Despite power problems, their capacity utilization jumped from 50% to 75% in that period. In addition to the encouragement from higher steel prices and demand, the following GOI concessions aided these private mills:

1. Removal of excise duty on steel ingots-rolled products.
2. Tax exemption on certain types of scrap from the integrated mills.
3. Removal of customs duty on imports of ferrous scrap.
4. Permission to make a wider range of products, including some grades of alloy steel.
5. Freedom to coordinate operations with the 200 private rerolling mills.[16]

In anticipation of a sustained annual growth of domestic demand between 15% and 20%, official production targets for the six integrated steel mills in FY1979-80 have projected a 15% increase in total production of steel ingots to 9.3 million tons and to 7.4 million tons for salable steel. These targets were unlikely to be fulfilled; actual production for the first quarter of FY1979-80 came to 17% below the goal. Considering the coal and power situation, it will be very difficult to make up the first quarter loss, let alone show a marked production increase.

Indian imports, primarily funneled through Steel Authority of India, Ltd. (SAIL), more than doubled in volume and increased 130% in value in FY1978-79. A sharp increase in imports of rolled and cold-rolled steel, plates, sheets, and structurals resulted from domestic shortages and from further relaxation of the GOI Import Trade Control Policy for 1978-79.

Indian exports of steel products in FY1978-79 fell sharply in volume and were valued at $134 million versus a value of $233 million the previous year. Export earnings for pig iron were valued at an additional $62 million. The GOI reimposed severe restrictions on steel exports and only shipments filling previous firm contracts were permitted. Most of those shipments that were permitted went to the Middle East, North Africa, and small Asian countries.

Japan, the Federal Republic of Germany, and the United Kingdom probably accounted for about three-fourths of the total Indian imports in FY1978-79. The United States, the U.S.S.R., and a few East European countries supplied the remainder. The United States, however, continued to be a major supplier of steel scrap to India and accounted for about 80% of the total.

By the end of 1979, steel imports had increased to the extent that Indian port facilities were inadequate to unload and clear the cargos on a timely basis. Besides the reported stockpiles at the ports—50,000 tons at Visakhapatnam, 39,000 tons at Madras, and 13,000 tons at Cochin—ships carrying a further 38,000 tons were waiting at these ports for unloading. Bombay and Calcutta were also seriously congested, further affecting the steel trade.

The GOI planned for a rapid expansion of the domestic steelmaking capacity to meet the high demand and regain the position of net exporter of steel. According to the GOI Steel Ministry, the current crude steel capacity of 10.6 million tons per year for the integrated steel mills is to be increased to 14.6 million tons per year by 1982-83 and further to 20.6 million tons per year by

1988-89.

The Indian steel industry, with 80% of its capacity in the public sector, depends primarily on the GOI annual budget for its expansion funds. The FY1979-80 budget provided the Steel Ministry a total of $456 million, a 10% increase over the previous year. Almost 80% of the amount will go to accelerate the expansion programs already underway at the Bhilai and Bokara mills.

A sum of $193 million was provided in FY1979-80 to facilitate the ongoing expansion of the Soviet-aided Bhilai steel mill from 2.5 to 4.0 million tons per year. Total cost of the project, to be completed in June 1983, has increased to $1.4 billion. A further expansion of capacity to 5.5 million tons per year has been planned for completion in 1988. More than 100 Russian technicians were working at the site. Much of the work consists of modernizing existing equipment or operations and reworking the entire coking section.

A sum of $166 million was available in 1979-80 to facilitate the stage II expansion of Bokaro's annual capacity from 1.7 million tons per year to 4.0 million tons per year by December 1980. Construction of the second cold-rolling mill complex, at a cost of $375 million was scheduled for completion by December 1982, if there were no delays in equipment supply.

A significant development in FY1978-79 was a new Indo-Soviet collaboration agreement for the construction at Viskhapatnam of an entirely new integrated steel mill in the public sector. The new mill will have a 3.0-million-ton-per-year capacity of salable steel and cost an estimated $2.8 billion. Plant design and equipment will be from the U.S.S.R. The Soviet Union has offered a 250 million ruble credit and has agreed to take back pig iron from the mill in lieu of cash repayment. The plant will have India's largest blast furnace (3,200 cubic meters), 7-meter-high coke ovens, and continous casting lines. The detailed project report was underway in 1979 and work could begin in FY1980-81.

Other expansion or modernization projects underway or approved in FY1979-80 include:

1. Construction at Rourkela of a new cold-rolled grain-oriented silicon steel mill and modernization of the hot strip mill.
2. Installation of a 50-ton OBM/Q-BOP converter at Durgapur, the first in India.
3. Continued construction on the new stainless steel mill at Salem in Tamil Nadu.
4. Renovation of the blast furnace and coke ovens at Indian Iron and Steel Co.
5. Completion of the expansion of the Alloy Steel Plant at Durgapur from 100,000 to 160,000 tons per year by the end of 1979. Also approved at this plant was the additional expansion of capacity to 260,000 tons per year at a cost of $59 million. Adaptation of a new secondary ladle refining process, such as vacuum oxygen decarburization (VOD), has been proposed as well.[17] Despite the above plans and projects, increasing investment costs, and persisting shortages of basic inputs, including coking coal, electric power, refractories, and steel scrap, will continue to restrict and delay the planned expansion of the Indian steel capacity. While every effort will be made to complete these programs, some delays in planned completion schedules can realistically be expected.

Lead.—India's lead production increased in 1978 with the startup of the country's second lead smelter. The new plant, located at Visakhapatnam in Andhra Pradesh was to reach its 10,000-ton-per-year design capacity by mid-1979. The plant utilizes imported concentrates, but it was hoped that as Indian lead ore production increased the plant would eventually switch to domestic concentrates. The older, 8,000-ton-per-year smelter is located at Tundoo in Bhihar and operates on concentrate shipped from the Zawar mines in Rajasthan and Agnigundala in Andhra Pradesh.

Present lead demand is roughly three times domestic production and rising slowly. Little change in production is anticipated in the next few years, and imports will play an increasingly important role. Lead imports were valued at $9.6 million in 1978 and were expected to increase during 1979. Australia was the major suppplier.

An important development underway in 1979 was the Sargipalli Mine project in Orissa scheduled to begin operation in 1982. The project cost was estimated at $14.4 million and designed to produce 500 tons of ore per day. Construction of a concentrator was also approved.[18] The Orissa ore reserves were reported as 1.48 million tons at 6.8% Pb proved; 0.58 million tons at 6.5% Pb indicated; and 0.7 million tons at 6.6% Pb inferred.

Manganese.—India's manganese ore production from 327 mines declined substantially in 1978. Minehead value was $21 million, about $2 million less than in 1977. Production was affected by the general recessionary conditions worldwide. It was believed that 1979 production rose slightly.

The four States of Orissa, Karnataka, Madhya Pradesh, and Maharashtra accounted for 90% of the total output. About 50% of production was from 313 small mines, a few of which yield up to 35,000 tons per year each. The public-sector Manganese Ore India, Ltd. (MOIL), which operated mines in Madhya Pradesh and Maharashtra, continued to produce over 75% of all high-grade ore and over 25% of the country's total production.

MOIL made international inquiries regarding construction of an agglomeration plant at its Balaghat mines to provide sinter or pellet feed to a proposed 60,000-ton-per-year ferromanganese plant. One or two beneficiation plants are also being considered to recover the fines presently underutilized at the semimechanized mines. The upgraded fines will be used as feed in the agglomeration plant. Tenders were expected to be issued in 1980 for the agglomeration plant.

Present domestic demand for manganese ore is estimated at just over 1 million tons per year. If GOI's steel expansion plans are successfully completed, consumption could reach 2 million tons per year for 1990. Manganese ore exports have shown a downward trend in recent years due largely to reduced imports by Japan plus a growing internal demand.

Nickel.—Nickel ore reserves were estimated at around 138 million tons at a cutoff of 0.5% Ni. Most of these reserves were located in the Sukinda deposit in Cuttack District, Orissa. Unfortunately for India's plans of nickel self-sufficiency, detailed testing of the Sukinda laterite ore by Indian and foreign consultants has failed to develop an economic method of processing the iron-rich ore. Studies by various groups were still underway but prospects for development of the deposit in the near future were dim.

Several other nickel occurrences have been mentioned in the press recently but will need detailed exploration to determine if they have economic potential. A nickel-bearing magnetite occurrence was reported near Pukphur, Nagaland. Samples were sent to the National Metallurgical Laboratory, Jamshedpur, for assay and ore beneficiation tests. The Ministry of Steel and Mines reported the discovery of a nickel deposit, estimated at 9.7 million tons of ore grading 0.97% Ni, in the Similipal Area of Orissa. And finally, a nickel deposit in the Singhbhum Belt of Bihar was believed to be sizable.

India's requirements of about 5,000 tons per year of nickel metal were met totaly by imports which were valued at $22 million in 1978. Principal suppliers were the United Kingdom and Canada.

Tin.—India has been conducting an exploration program on the reportedly rich Tonkupal tin deposit in Bastar District of Madhya Pradesh. The survey has been supported by a United Nations Development Program grant of about $2.5 million. Information on the survey findings was not yet available, but the deposit has been described as rich in the Indian press.

Zinc.—India's zinc production rose significantly in 1978, the fourth consecutive yearly increase, and topped 50% of the yearly market demand for the first time in recent years. The Government-owned Hindustan Zinc Ltd. (HZL) reportedly also increased production in 1979 to 51,000 tons despite severe power shortages at its two smelters, Debari in Rajasthan and Visakhapatnam in Andhra Pradesh. The private-sector Cominco Binani Zinc Ltd. in Alwaye, Kerala, has a 20,000-ton-per-year rated capacity and provides the remainder of the primary Indian zinc output.

With the startup of the 30,000-ton-per-year Visakhapatnam smelter in 1977, India's installed capacity for primary zinc production stood at 95,000 tons per year. The domestic demand was projected to be 108,000 tons in 1979-80 and to increase slowly to about 126,000 tons in 1982-83. There were no immediate plans to expand the country's present production capacity because of the high capital cost and power-consuming nature of this industry. Imports therefore will continue to be essential for the forseeable future.

The planning commission's production targets were set at 73,000 tons for 1979 and 82,500 tons for 1980. Considering the power situation, it is unlikely that those figures will be met.

The major comsumers of zinc in the country include the Rourkela steel plant, the brass industry, die casting, and dry batteries. Consumption in FY1978-79 amounted to approximately 100,000 tons. In addition, secondary metal recovery was 25,000 tons.

Owing to the increase in production during 1978, the value of imports of zinc metal dropped to $27 million in contrast to $50 million in 1977. The long-term outlook, however, is for higher imports of zinc metal, scrap, and concentrates. During 1978, imports came primarily from Canada, the U.S.S.R., Australia, Zaire, and Zambia. Holland, the United Kingdom, and the Federal Republic of Germany were the major suppliers of scrap.[19]

During 1978, zinc-lead ore production, which came mainly from HZL's Zawar group of underground mines in Rajasthan, rose to 1.05 million tons or about 14% higher than in 1977. The target for 1979 was 1.15 million tons of ore, with further increases anticipated when the Rajpura-Dariba Mine becomes operational in 1982, and the Zawarmala mines in 1984 to 1985.

Developments at the Rajpura-Dariba Mine continued with the sinking of the 6.1-meter-diameter main shaft nearing the 300-meter level. In 1979 HZL reportedly awarded the contract for the new concentrator at the Rajpura Mine to Utkal Machinery Ltd., a subsidiary of Larsen and Toubro Ltd. Sala International AB of Sweden has agreed to do the basic engineering on the project, but a large part of the fabrication is to be done by Indian firms. The concentrator will treat 2,700 tons per day of lead-zinc ore and 400 tons per day of lead-zinc-copper ore in a separate stream.[20]

The zinc oxide plant at Visakhapatnam began trial operations early in 1979. The plant treats leach residue from the zinc circuit and slag from the lead circuit. With this startup the Vaskhapatnam complex was nearly complete. The second phase of the lead plant, a sintering operation, and a gas-cleaning section was to be completed by mid-1979.

Barite.—Indian barite production increased for the sixth consecutive year in 1978 and was valued at $2.2 million at the pithead. Production also increased in 1979 and plans called for doubling of recent tonnage levels by FY1982-83 and further increase to nearly 1 million tons by FY1987-88. The largest single deposit of high-grade ore in the world is located at Mangampet in Cuddapah District, Andhra Pradesh. Over 95% of the barite is mined in this and four other districts in Andhra Pradesh. Current output levels rank India second or third in world production of barite. The principal mine at Mangampet, operated by the State-owned Andhra Pradesh Mining Corp., was well mechanized by Indian standards and produced about 560 tons per day of ore during 1979. About 70% to 80% of the run-of-mine production was marketable ore containing +92% Ba_2SO_4 and with a specific gravity of over 4.1. Noncommercial ore was stockpiled for possible future beneficiation. Plans call for production to be raised to 1,000 tons per day in the next few years.

India's 60 million tons of proved reserves for barite were reportedly the largest in the world. Total estimated reserves including inferred ore were on the order of 200 million tons.

Annual domestic consumption of barite totaled about 100,000 tons with the Oil and Natural Gas Commission accounting for roughly 70,000 tons and the chemical, paint, and rubber industries accounting for most of the remainder. Future consumption is likely to remain near current levels and substantial surplus therefore will be available for export.

During FY1977-78 exports of barite, primarily powder, were valued at $17 million. The major markets were the Middle East oil-producing States of Iran, Iraq, and Egypt. Under the new export policy for 1979-80 all exports are now channeled through MMTC. The policy, as subsequently amended, includes chemical-grade powder white, snow white, and super snow white. Up to May 1979 mine owners were permitted to enter into private export contracts. The export target for FY1979-80 was 300,000 tons.

Cement and Limestone.—Limestone production from 392 mines declined marginally in 1978 but minehead value dropped about 16% compared with 1977. Considering the projected expansion of the cement and steel industry, limestone consumption was projected to double to over 60 million tons per year in FY1982-83, and reach 79 million tons per year in FY1987-88.

Despite the low unit value, limestone accounted for about one-half of the total value of India's nonmetallic mineral production in recent years.

Indian limestone reserves were estimated at 63 billion tons with about 6 billion considered proved. Forty-eight billion tons were of cement grade. A 37-million-ton deposit of flux-grade limestone was recently proved at Jaggay-yapetta in Andhra Pradesh. Exploration continued in a number of areas for new reserves, particularly for flux and chemical grades, and to better delineate and assay the proved category of existing reserves.

The annual capacity of the Indian cement industry rose from around 21 to 23 million tons during the past several years, while demand has increased much faster, resulting in an imbalance between demand and supply. In addition, shortages of power and coal and the poor quality of the coal shipped affected capacity utilization which averaged 90% during 1978, then fell to about 82% in 1979. A marginal production increase in 1978 became a serious drop of 1.4 million tons in 1979. An ominous feature in the production decline was that nearly 1 million tons of the shortfall occurred in the last 5 months of the year.[21]

The problem of coal quality was particularly important for the cement industry. A significant portion of the total ash content of coal (ranging from 25% to 35%) is absorbed in the cement during firing, necessitating the use of higher grade limestone to maintain a given quality in the finished cement.

Demand for cement was about 22 million tons in 1978, and rose considerably during 1979. By yearend 1979 the Indian press was estimating the overall gap between domestic production and demand at 6 to 7 million tons.[22]

As a result of the shortages, imports by the State Trading Corp. in FY1978-79 increased fivefold over the previous year and were certain to increase again in FY1979-80. The major suppliers in 1978 were North Korea, South Korea, and Romania. Offers of cement from Sri Lanka and Indonesia were also under consideration.

Plans call for a substantial increase in capacity. Licenses and letters of intent have reportedly been issued for additional capacity totaling 25 million tons, of which about 5 million tons was expected to be in production by March 1980. The remaining additional capacity should bring the installed capacity to over 40 million tons by the next decade.

In May 1979 the GOI announced financial incentives for the plants to encourage production as well as to undertake expansion programs. The former price controls did not keep up with rising costs and hence left such a small profit margin that there was little incentive to put in new capacity. Under the new system, new or existing units undertaking expansion will receive a higher price for their product. Cement plants using furnace oil will also receive a subsidy.

To promote development in underdeveloped and inaccessible areas, GOI has offered strong financial incentives for the establishment of mini cement plants. The plants will largely be set up in remote areas where they will meet local demand and be limited in capacity to 66,000 tons per year. Since the announcement of the incentives, GOI has received 41 applications from throughout the country. These would have an aggregate capacity of 1.7 million tons per year in addition to the 1.0 million tons per year already created.

Diamonds and Gem Stones.—Domestic production of diamonds, from the Government-owned and operated Panna Diamond mines in Madhya Pradesh, accounted for only 2% of India's demand for rough stones. The 1978 production was valued at $1.2 million compared with $1.5 million in 1977. Production of other precious and semiprecious stones in 1978 included significant amounts of emerald and gem-quality garnet. Approximately 3,000 tons of industrial garnet was also produced in 1978.

India's small production of diamonds belied the importance of the industry in the economy. India was one of the world's major finishers of gem diamonds, particularly specializing in the very small stones. The value of diamonds, pearls, other gem stones, and jewelry exports was put at $682 million in FY1977-78 and $830 million in FY1978-79, with diamond accounting for over 92% of the value. That ranked diamond as India's principal export and accounted for about 13% of total exports in FY1978-79.

India's diamond industry was dependent on the import of rough diamond which was valued at $580 million in FY1978-79. India was negotiating with the U.S.S.R. and several African countries in an attempt to diversify its sources of rough diamond and become less dependent on Belgium and the United Kingdom. During the year the GOI established the Hindustan Diamond Co. with the objective of buying and distributing rough diamond to the small polishers. Three large diamond exporters from Bombay reportedly were planning on establishing jointly a modern, well equipped diamond finishing complex at Surat in Gujarat the major polishing center in India.

Fertilizer.—The fertilizer industry has shown impressive growth from a base of a few tens of thousands of tons in the early 1950's to a present nutrientwise consumption in 1978-79 of 3.4 million tons of nitrogen, 1.1 million tons of phosphorus (P_2O_5), and 0.6 million tons of potassium (K_2O). Since 1974 average annual growth of consumption has been over 12%. Much of the increase has been the result of a GOI promotional effort in selected districts to educate and train the farmers in the advantages and proper use of fertilizers. In addition, the growing use of high-yield crop varieties, a steadily increasing use of irrigation, and GOI-subsidized prices have all combined to further strengthen fertilizer demand.

The main natural fertilizer mineral produced in India was phosphate rock, valued at about $23 million in 1978. About 90% of this came from Rajasthan, which has the largest reserves in the country, estimated at 100 million tons. Production of the other phosphorus mineral apatite dropped in 1978 then remained at about the same level in 1979. Long-range production targets for phosphate rock and apatite are put at over 2 million tons for FY1982-83. Most of the phosphate increase was to come from the huge Jhamar Kotra deposit in Rajasthan where a 200-ton-per-day pilot plant for beneficiating the lower grade ore was under construction. The $1.7 million plant will be based on a froth flotation process developed by the Indian Bureau of Mines specifically for this type of highly abrasive rock. The process reportedly upgrades a sample from 13% P_2O_5 and 10% MgO to 35% P_2O_5 and 1.2% MgO with an 82% recovery factor. The plant was to be completed in 1980.

Based on the pilot plant's performance, a project report will be prepared for a 500,000-ton-per-year commercial plant to be set up at the mine at an estimated cost of $100 million. Additional advantages of the phosphate concentrator operation will be a reduction in the high silica content of the ore and a more uniform and more reactive feed for the phosphoric acid plants.

Another development in the phosphate industry was the interest expressed by Hindustan Zinc Ltd. in slurry pipeline transport of its phosphate rock from Maton Hill Mine a distance of 10 kilometers, to its smelter and phosphoric acid plant at Debari. Maton Hill Mine has the only phosphate rock beneficiation facilities in India. Plans are to double present capacity of the contractor to 600 tons per day.

Domestic production of phosphorus raw materials was not sufficient to meet demand of the fertilizer industry. As a result, roughly 60% of the requirements in 1978 were met by imports of rock phosphates from Jordan, Morocco, the United States, and Senegal. Firm orders for 1,750,000 tons plus options for another 205,000 tons were contracted for 1979. Estimated import requirements for 1980 were put at 2.0 million tons with the upward trend likely to continue as the demand for fertilizers steadily increases.

There was no commercial production of potash minerals in India in 1979, India's potash requirements are basically met through import of straight potassium chloride. The country is one of the biggest markets in the world for potash exporters, with only the United States, Poland, Brazil, and Japan buying more. Only three countries supplied the needed potash imports, the German Democratic Republic, the Federal Republic of Germany, and Canada. All purchases were made by MMTC. Marketing within India is done by Indian Potash Ltd. of Madras, a joint public-private sector company.[23]

In an effort to relieve the import dependency, the GSI started a potash exploration program in 1974 and has continued the work through 1979. The survey identified and delineated a 30,000-square-kilometer area, from the Nagaur Basin in Rajasthan to Satipuur in Haryana, as a potential zone of potash exploitation. So far, discoveries in the Lakhasar area in Churu District (4% to 8% potash) and in Gossainnagar and Bikaner have been reported. A new high-capacity drilling rig was added in 1979 to the exploration effort which will be continued on a priority basis.

Production of nitrogenous fertilizers was well below the 3.26-million-ton contained nitrogen capacity of the industry in 1978-79. The overall capacity utilization was less than 70%, and a small improvement over the 65% recorded in 1977-78. One major problem with the existing plants reportedly has been a poor maintenance record often leading to production stoppages. A Government survey concluded that from one-third to two-thirds of the total capacity loss was directly attributable to maintenance inefficiency. The remainder coming from a combination of transportation bottlenecks, raw material shortages, labor problems, and the power shortages.

Several new ammonia units came into production in 1979 and several others were beginning shake-down trials at yearend. The most important of these were the twin coal-based ammonia-urea plants at Talcher and Ramagundam. The 900-ton-per-day N ammonia plants use domestic high-ash coal as feedstock and are among the largest of that type in the world.

Major new ammonia-urea capacity expansion will be undertaken using the Bombay High natural gas as feedstock. Four 1,350-ton-per-day urea plants will be constructed. The proposed location of these plants has been highly controversial but it was finally decided in 1979 that two of the units will be set up at Thal-Vaishet about 21 kilometers south of Bombay. The other two plants will be at Hajira, near Surat in Gujarat State. Construction could begin in 1980.

Mica.—Crude mica production continued an 8-year downtrend in tonnage although value increased marginally in 1978 because of higher prices. Bihar accounts for about 50% of total production and Andhra Pradesh and Rajasthan supply most of the remainder. The decline is because of general changes in market conditions and increased mining costs of an essentially cottage industry.

Despite the officially reported decline in production, mica exports rose by 1,000 tons in 1978, and the value remained basically unchanged.

According to the Indian FY1979-80 Export Policy, exports of processed mica products were no longer subject to Government export control, but only to GOI posted prices. Export duty on mica as of April 1978 ranged between 10% and 30% depending on grades.

Domestic consumption remained small but growing. A number of mica-based industries have been established or planned by the GOI Mica Trading Corp. (MITCO) in an effort to diversify and add to the value of the export trade. MITCO has set up a small, dry-ground mica powder plant at Jhumritalaya in Bihar. Under consideration were plants for micronized powder, wet-ground mica, and mica paper and paper-based products.

MINERAL FUELS

Petroleum and Natural Gas.—India continued to be about 60% dependent on imports of crude oil and refined products despite a steadily increasing domestic production.[24] The cost of imports was about $1.85 billion in 1977, $2.0 billion in 1978, and estimated at $3.5 billion in 1979. Iran, Iraq, Saudi Arabia, the U.S.S.R., and the United Arab Emirates were the major crude oil suppliers through 1978. The situation changed in 1979, however, with Iran dropping from first to third place among suppliers. The U.S.S.R. was the largest supplier of refined products.

India's crude import requirements for 1980 were projected to rise to 18 million tons, but will be affected by any measures adopted to curtail demand. Most of these imports were expected to be met by traditional suppliers but in addition the Government contacted Nigeria, Algeria, Indonesia, and several Latin American countries in an effort to diversify its crude oil sources and to secure long-term commitments for these supplies.

Total refined product imports for 1980 were projected at around 5.0 million tons. India's total import bill for both crude oil and refined products could rise to about $4.6 billion or roughly 50% of India's total export value.

Consumption of petroleum products increased nearly 9% in 1978, and was estimated to be 11% higher in 1979. The increased consumption was due partly to the drought conditions which lead to expanded use of diesel oil for irrigation pumps. The country's general infrastructure problems also forced greater use of trucks and hence additional motor fuel consumption.

The 11 Indian refineries operated at about 80% of their 31.5-million-ton-per-year rated capacity in 1978. Except for the 0.5-million-ton-per-year Assam Oil Co. refinery at Digboi, which was scheduled to be taken over by the GOI, India's entire refining capacity falls under the public sector control. The Madras and Cochin refineries, however, still have about 26% of their respective shares held by non-Indian interests.

Construction of the 6-million-ton-per-year Mathura refinery in Uttar Pradesh continued but work was delayed nearly a year by labor problems and a slippage in equipment deliveries, primarily from the U.S.S.R.

The main development in 1978 was the completion on schedule of the 76-centimeter subsea crude pipeline from the Bombay High to Uran near Bombay. The parallel natural gasline also began operating and contributed 12% of the total natural gas consumption. The oil pipeline completion allowed a doubling of offshore crude oil production in 1978 to nearly 3 million tons, and a further increase to an estimated 4.4 million tons in 1979. Onshore production dropped slightly in 1978 and probably was static in 1979.

Development work on Bombay High continued at a high rate. Six platforms have been installed, two of which also have separation facilities. A compression and pumping station for Bombay High north platform is to be installed by May 1980 with a processing capability of 180,000 barrels per day of oil and 106 million cubic feet per day of gas. Work on other platforms was underway which would raise production to 140,000 barrels per day by September 1980. At Uran, the receiving end of the Bombay High pipeline, construction was underway on oil storage tanks, a crude stabilization plant, and gas fractionation units. The Uran complex, scheduled for mid-1980 completion was designed to handle up to 240,000 barrels per day of crude and 212 million cubic feet per day of gas with provision for further expansion.

Development of the 10-trillion-cubic-foot Bassein offshore gasfield was expected to be started in 1980. Gas from this field will be used initially for fertilizer production in Maharashtra and Gujarat.

Coal.—Coal was India's principal commercial energy resource, and the Government continued to stress the importance of exploration and periodic reassessment of national coal reserves. According to the latest estimates, Indian coal reserves were increased from 84 billion tons in 1973 to nearly 112 billion tons in 1979 with 26 billion tons now counted proved. These total deposits were calculated to a depth of 1,200 meters and seams in excess of 0.5 meter thick. Lignite reserves were 3.5 billion tons and 58% classed as proved.[25] A major deposit not included in the reserves was discovered under the Gujarat oilfields at a depth of 1,200 to 2,000 meters.

Despite the impressive reserve figures, most Indian coal contains a very high ash content, high moisture, and low calorific value causing at times severe utilization problems.

Coal production has remained nearly static for the last 4 years and fell well below the projected demand of 116 million tons in FY1979-80. Coal production was valued at $916 million in FY1978-79 and about $1,360 million in 1979-80. About 13 million tons of coal demand could not be met in 1979, although pithead stocks remained at about the 1978 level of 14 million tons.

India's coal industry faced a number of problems in addition to the power situation already described. Among them were a surplus labor force and a high rate of absenteeism and labor problems which affected cost and productivity (approximately 0.67 ton per worker shift for the last 5 years). Coal India Ltd. (CIL), the Government-owned holding company for the coal industry, and the few captive mines of the steel mills, employed more than 600,000 people, over half of the total mineral industry labor force. The surplus labor force totaled about 50,000.

A shortage of certain explosives accounted for a production loss of over 500,000 tons in 1979. Imports of explosives amounted to 3,800 tons but fell short of the requirements by 3,200 tons. Flooding caused a 2.5-million-ton production loss in 1978 but was not an important factor during 1979.

Coal transport bottlenecks affected the movement of coal from the pithead to the consumer. The average daily supply of railroad cars reportedly was 8,400 compared to a demand of 9,600. For CIL, average daily loading dropped 5% in 1979 and rail car turn around time increased from 11 days in 1976 to 14 days in 1979.

To meet the growing demands of the steel mills for improved and consistent grades of coal, six new coking coal washeries plus one major expansion were under construction at a total cost of $400 million. Completion of these will raise the annual washery throughput capacity for coking coal 11.3 million tons per year to 34.9 million tons per year. In addition, the first two noncoking coal washeries totaling 7.5 million tons per year capacity are to be built. Scheduled for FY1984-85 completion, these two plants will be located at the Singrauli coalfield.

The National Thermal Power Corp. was considering establishing captive washeries at each of four planned super thermal power stations which will require 37 million tons per year of coal to operate. Capacity utilization of the current operating washeries was 69% in 1978-79.

The ash content of the coal now being washed ranges from 24% to 37%. Washing reduces the ash to a range of 18% to 20%. One hundred tons of raw coal yields 55 to 65 tons of washed coal; 20 to 25 tons of middlings containing 34% to 40% ash, and the balance is waste. Middlings are generally sold as noncoking coal for power generation.

Capital expenditures during 1980-84 by CIL are estimated at $3.12 billion. Major coal development projects place emphasis on short gestation open pit mines and reconstruction and mechanization of underground mines. By the end of the decade, 50% of production should be coming from open pit mines compared with 25% in 1978.

The Mineral Industry of Indonesia

By John C. Wu[1]

Indonesia's gross domestic product (GDP) in current prices was $51,200 million in 1979 compared with $50,297 million in 1978.[2] Between 1977-79, the annual growth rate of the GDP at constant 1973 prices averaged 6.6%. In 1978, the three largest components of the GDP were agriculture, $17,151 million; wholesale and retail trade, $8,349 million; manufacturing, $6,187 million; and mining and quarrying, $5,583 million.[3] For the past decade, annual input by the mining and quarrying sector constituted close to 12% of the GDP.

Under the Third 5-Year Development Plan (1979-1984), Indonesia's real economic growth was projected at 6.5% per year. Rural development, transmigration programs, regulations of land ownership, and expanded education and health programs were to be stressed to achieve social equity. The industrial sector, to be the fastest growing sector, was to provide increasing employment opportunities. Also, the Government was to encourage the private sector to increase its share in capital investment programs. Private foreign investment would continue under the plan to be a source of capital, technology, and management skills. The projected average annual growth rate by sector during the 5 years was as follows: Industry, 11.0%; transportation and communications, 10.0%; construction, 9.0%; mining, 4.0%; agriculture, 3.5%; and other components, 8.1%. Growth targets were scaled back to slightly below the levels in the previous development plan because of an expected stagnation or decline in oil production.

The fuels sector, presently accounting for two-thirds of total export earnings and for about one-half of government revenues, will continue to dominate the economy. While Indonesia's daily output has declined from a peak output of 1.68 million barrels per day (mbpd) in 1977 to between 1.55 and 1.60 mbpd in 1979, revenues were up as a result of price hikes. Notwithstanding, the Government considered an active oil exploration program to be essential. Significant progress was made in the production of liquefied natural gas (LNG). During 1979, five liquefaction trains were in operation, two in Kalimantan and three in Sumatra. Moreover, prospects for expansions at both fields were good. In coal, the Government continued its effort toward the long-term development of the country's coal reserves. Engineering design contracts were signed for the expansion of the Bukit Asam coal mine. Production sharing contracts were completed with foreign firms for coal concession areas in East Kalimantan. In addition, Indonesia was developing hydroelectric and geothermal energy as a means of preserving petroleum for the export market.

The nonoil minerals sector was the fourth largest foreign exchange earner after oil and natural gas, timber and wood products, and rubber. Indonesia is the fourth largest producer of tin in the world. The growth potential for tin mining is considerable due to large unexplored but likely deposits offshore Sumatra. Freeport Indonesia began work on its expansion of an underground copper mine in Irian Jaya. Pacific Nikkel Co. was reconsidering a nickel venture on Gag Island off the western coast of Irian Jaya. The Government dropped its plans for an alumina complex on Bintan Island; however, work continued on the hydroelectric-aluminum smelter project on the Asahan River, a cooperative venture between Japan and Indonesia.

The Inter-Government Group on Indonesia (IGGI) is a consortium of 14 donor countries and international financial institutions.[4] IGGI meets annually to consider and to allocate concessionary development loans to Indonesia. In April 1979, IGGI endorsed the Government's new 5-Year Development Plan and agreed that new foreign borrowing by the Government could be increased in 1979 by $2.78 billion. About 70% of the increase (or $1.9 billion) was to be provided by IGGI. Lending configuration of this amount was as follows: Over $1 billion from The World Bank, Asian Development Bank, United Nations Development Program, and bilateral donors; and $850 million from non-IGGI sources, mostly commercial borrowings. Japan was the largest bilateral donor, pledging $262 million, followed by the United States, $205 million.

PRODUCTION

Indonesia's mineral industry is dominated by oil and natural gas production, which are of world consequence. Coal output is insignificant, averaging less than 300,000 tons annually for the past decade. Nickel ore production has increased yearly during the last 5 years, and output in 1979 was nearly double the output in 1975. Indonesia also produces nickel matte and ferronickel. The increased output of tin and copper during 1978-79 was largely offset by sharp decreases in output of iron sands, gold, and silver. Manganese mining has continued to decline since 1975. Indonesia's cement production capacity grew from 2.5 million tons per year in 1977, to 4.8 million tons in 1978, and in 1979 reached 5.9 million tons. The momentum in construction activities was reflected by increased output of cement, aggregates, and other construction materials. Development of the fertilizer industry since 1974 was evident inasmuch as production of nitrogenous fertilizers has increased annually. By the end of 1979, the production capacity for urea and ammonia was 1.6 million tons per year.

Table 1.—Indonesia: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1976	1977	1978[p]	1979[e]

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes Au content of copper ore and output by Government-controlled operations. Gold output by operators of so-called People's mines is not available but may be as much as 30,000 troy ounces per year.

[2]Includes a small amount of cobalt which is not recovered separately.

[3]Data represent limestone used for cement production. Excludes considerable amounts of limestone produced by enterprises under local jurisdictions for building materials, for crushed rock to be used as aggregate, and to burn for lime.

[4]Reported figure.

[5]Sulfur produced by other than the Frasch process.

TRADE

As a result of oil exports, Indonesia's strong balance-of-payment position improved favorably at the end of the decade. Total exports grew from $10,853 million in 1977 to $11,643 million in 1978, reaching $15,578 million in 1979. Imports grew less sharply from $6,230 million in 1977, to $6,690 million in 1978, to $7,225 million in 1979.

As in the past, the largest share of Indonesia's trade has been with other countries in Asia. In 1978, trade with Far East nations accounted for 69% of Indonesia's total trade, compared with 77% in 1979. Exports to Japan alone in 1978 were valued at $4,566 million, and in 1979, $6,501 million. Imports from Japan were $2,016 million in 1978 and $1,906 million in 1979. The United States was Indonesia's second most important trading partner. Exports to the United States were $2,962 million in 1978 and $2,858 million in 1979 compared with Indonesian imports from the United States of $832 million and $933 million, respectively. Imports from Europe were $993 million in 1979, whereas exports totaled $1,036 million.

By commodity group, Indonesia's leading export classes in 1979 were, in million dollars: Mineral products, 9,283; wood and articles thereof, 1,623; resins and rubber, 857; vegetable products, 853; base metals, 455. The top five import classes in 1979 were, in million dollars: Machinery and electrical equipment, 1,501; base metal manufactures, 852; vegetable food products, 755; minerals, 745; and chemicals, 739.

Mineral shipments continued to be of overriding importance in terms of total exports. In 1979, mineral exports (including oil) constituted 66% of total exports. The value of oil exports alone was $8,858 million compared with exports of tin and other minerals of $424 million. Indonesia ships significant quantities of bauxite, copper concentrate, and nickel ore and concentrate, primarily to Japan.

Table 2.—Indonesia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite and concentrate thousand tons	1,138	911	Japan 882; Netherlands 29.
Metal including alloys, all forms	174	77	Mainly to Singapore.
Copper ore and concentrate	182,292	186,601	Japan 138,171; Federal Republic of Germany 48,430.
Iron and steel metal:			
Scrap	--	6,018	Philippines 5,668; Japan 350.
Ferroalloys	3,800	4,686	Japan 4,392; United States 294.
Steel, primary forms	9	--	
Semimanufactures	49	7,721	Hong Kong 4,005; Singapore 3,327.
Manganese ore and concentrate	260,044	88,528	Japan 87,868; Taiwan 650; Singapore 10.
Nickel:			
Ore and concentrate	640,630	576,377	All to Japan.
Matte, speiss, similar materials	2,830	15,627	Japan 12,856; Netherlands 2,771.
Tin:			
Ore and concentrate	1,968	976	All to Malaysia.
Metal including alloys:			
Scrap	2,695	676	All to Japan.
Unwrought	21,314	22,859	Japan 6,670; Netherlands 6,300; Singapore 5,089.
Semimanufactures	2,207	(1)	All to Singapore.
Zinc:			
Oxide	185	80	All to Japan.
Metal including alloys:			
Scrap	378	115	Singapore 100; Japan 15.
Unwrought and semimanufactures	93	253	Singapore 211; Japan 42.
Other: Ash and residue containing nonferrous metals	111	567	Taiwan 250; Singapore 195; Republic of Korea 104.
NONMETALS			
Abrasives: Pumice, emery, natural corundum, etc	5	23	All to Singapore.
Barite and witherite	3,402	12,546	Singapore 7,353; Saudi Arabia 4,082; Kuwait 1,110.
Bromine, iodine, fluorine	17	--	
Cement	--	36,700	All to Thailand.
Clays, crude:			
Bentonite	(1)	2,736	Taiwan 2,000; Singapore 736.
Kaolin	2,175	2,558	Taiwan 1,928; Japan 610; Federal Republic of Germany 20.
Other	--	49	All to Singapore.
Fertilizer materials:			
Manufactured, nitrogenous	310,577	243,952	India 102,675; Zambia 52,599; Philippines 41,961.
Ammonia	1,366	827	Malaysia 493; Singapore 293; Thailand 41.
Stone, sand and gravel:			
Crude and partly worked	187,031	260,750	All to Singapore.
Worked	3	6	All to France.
Quartz and quartzite	937	--	
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	2,969	--	
Coal, all grades, including briquets	15,350	31,673	Malaysia 11,450; Singapore 9,150; Thailand 6,773.
Coke and semicoke	1,000	--	
Gas, hydrocarbon, natural thousand tons	359	5,012	Japan 3,663; United States 1,282; New Zealand 30.
Petroleum:			
Crude thousand 42-gallon barrels	506,638	518,022	Japan 218,359; United States 163,911; Singapore 44,672.
Refinery products:			
Gasoline, motor do	1,073	101	All to Sabang.[2]
Kerosine and white spirit do	33,825	329	Japan 213; Sabang[2] 115.
Distillate fuel oil do	428	1,563	Thailand 1,012; Sabang[2] 192; Hong Kong 184.
Residual fuel oil do	1,596	29,765	Japan 24,099; United States 5,666.
Mineral jelly and wax do	204	205	Singapore 177; Philippines 28.
Total do	37,126	31,963	

[1]Less than 1/2 unit.

[2]Official Indonesian trade statistics report exports to Sabang, an Indonesian island near the western end of Sumatra which operates as a free trade zone; final destination of such shipments can not be determined.

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite and concentrate	300	320	Singapore 300; China, mainland, 20.
Oxide and hydroxide	17,664	21,866	Japan 10,164; United States 6,007; United Kingdom 2,462.
Metal including alloys:			
Scrap	1	42	Singapore 30; Japan 10; United Kingdom 2.
Unwrought	11,623	12,288	Japan 6,193; Canada 2,192; Australia 2,007.
Semimanufactures	17,205	18,363	Japan 6,971; Romania 1,663; United States 1,543.
Arsenic trioxide, pentoxide, acids	91	142	Malaysia 69; France 33; Federal Republic of Germany 16.
Chromium:			
Ore and concentrate	(1)	41	All from Japan.
Metal including alloys, all forms	87	220	U.S.S.R. 95; Italy 60; China, mainland, 40.
Cobalt oxide and hydroxide	15	9	Australia 5; Belgium-Luxembourg 3; United Kingdom 1.
Copper:			
Matte	3	--	
Copper sulfate	172	100	France 40; Japan 22; Netherlands 10; United Kingdom 10.
Metal including alloys, all forms	14,811	18,240	Japan 14,977; Australia 2,049; Federal Republic of Germany 492.
Gold metal, unworked or partly worked troy ounces	329,545	183,902	United Kingdom 89,057; Federal Republic of Germany 87,289; Switzerland 7,555.
Iron and steel:			
Ore and concentrate	209	55,070	Sweden 55,020; Malaysia 50.
Metal:			
Scrap	47,084	80,690	Australia 33,400; United States 20,981; Singapore 8,213.
Pig iron, including cast iron	34,411	32,429	India 12,838; Turkey 10,000; Republic of Korea 3,000.
Sponge iron, powder, shot	558	260	United Kingdom 53; Federal Republic of Germany 46; Japan 41.
Spiegeleisen	--	40	All from Federal Republic of Germany.
Ferroalloys	2,632	4,172	Taiwan 1,662; Australia 1,054; Philippines 605.
Steel, primary forms	167,812	203,456	Taiwan 66,960; Australia 39,644; India 34,532.
Semimanufactures:			
Bars, rods, angles, shapes, sections	273,433	240,498	Japan 152,577; Australia 45,430; Taiwan 16,904.
Universals, plates, sheets	581,002	662,731	Japan 529,113; Republic of Korea 44,596; Australia 25,487.
Hoop and strip	43,955	37,821	Japan 33,858; Taiwan 1,591; Australia 1,319.
Rails and accessories	9,890	16,200	Japan 9,547; Netherlands 2,506; United Kingdom 920.
Wire	5,969	5,980	Japan 3,278; Australia 957; Federal Republic of Germany 380.
Tubes, pipes, fittings	92,942	185,873	Japan 121,974; Singapore 30,920; France 9,584.
Castings and forgings, rough	5,056	5,192	Japan 1,406; India 744; Australia 694.
Lead:			
Oxides	710	1,125	Australia 825; China, mainland, 135; United Kingdom 50.
Metal including alloys, all forms	4,883	7,243	Australia 6,374; Federal Republic of Germany 573; North Korea 102.
Magnesium metal including alloys, all forms	85	21	Australia 6; Japan 6; Belgium-Luxembourg 5.
Manganese:			
Ore and concentrate	7,940	8,605	Singapore 5,684; Republic of South Africa 500; Philippines 400.
Oxides	2,710	4,067	Singapore 2,350; Japan 1,590; Hong Kong 105.
Mercury	289	653	Singapore 465; Japan 100; Federal Republic of Germany 71.
Molybdenum metal including alloys, all forms	5	3	Japan 2.
Nickel:			
Ore and concentrate	1	(1)	All from United States.
Metal including alloys, all forms	252	1,669	Federal Republic of Germany 1,291; Japan 269.
Platinum-group metals including alloys, all forms troy ounces	161	3	All from Japan.
Silver metal including alloys, all forms do	104,554	16,398	Australia 15,432; United States 210.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—The existing bauxite mines, operated by a unit of the State-owned P.T. Aneka Tambang, produced a little more than 1 million tons of high-grade bauxite (up to 53% Al_2O_3 content and 10% moisture) in 1978 and 1979. These mines are located around Kijang on Bintan Island and the nearby islets of Kijan, Angkut, Dendang, Kelong, and Tembeling. Practically all of the bauxite is exported to Japan under a 10-year contract calling for 1.2 million tons per year. The contract will expire in 1984, when the entire 8 to 9 million tons of export-grade bauxite reserves are expected to be virtually depleted.[5] The reduction in production and export of bauxite in recent years is primarily due to lack of demand for bauxite in Japan, where about one-third of the aluminum reduction plants have been closed for various economic reasons.[6]

During 1978, two major events had been reported on Indonesia's alumina and aluminum development projects. The first significant event was related to the alumina project, which calls for the building of a new alumina smelter on Bintan Island. The second event was related to the Asahan aluminum project, which calls for the building of two hydroelectric powerplants, a 225,000-ton-per-year aluminum smelter, and extensive ancilliary facilities located on the Strait of Malacca at Kuala Tanjung, Sumatra.

The Government of Indonesia, through P.T. Aneka Tambang, has been considering proposals from several countries since 1971 to build a new alumina smelter on Bintan which would convert the estimated 25 to 27.5 million tons of reserves of below-export-grade Bintan bauxite into alumina. It would supply 450,000 tons of feedstock annually for the Asahan aluminum smelter at Kuala Tanjung in North Sumatra, scheduled to start its first-stage operation in 1982. One of these proposals was a $590 million (estimated at $450 million in 1977), 600,000-ton-per-year alumina smelter on Bintan Island submitted by the German company Klockner I.N.I. and the Aluminum Co. of America (ALCOA). This proposal was accepted by the Indonesian Government in December 1978. Then by a surprising move of the Indonesian Government, the whole project was cancelled in January 1979. The main reason for dropping the tender was that Japanese suppliers estimated that they could supply alumina at $180 per ton in 1982, whereas the proposed Bintan alumina would cost about $225 per ton. However, P.T. Aneka Tambang is currently studying the possibility of transporting below-export-grade bauxite from Bintan Island to a proposed alumina smelter at Kuala Tanjung in Sumatra near the site of Asahan aluminum project. The still unanswered question is the suitability of Bintan bauxite for the Asahan aluminum project in terms of its quality and the possibility of cost reduction.

The much publicized Asahan aluminum project, operated by Indonesian Asahan Aluminium, has finally resolved the problem of a substantial cost overrun due to inflation and various design changes of original hydroelectric powerplants in late 1978. The estimated total project cost is now about $2.3 billion, which is more than 2 1/2 times the original $812 million estimated in 1975. The entire project, P.T. Indonesia Asahan Aluminium, is 90% owned by the Nippon Asahan Aluminium Company of Japan (in turn owned by Sumitomo Chemical Industries, Ltd., Showa Denko K.K., Mitsui Aluminium Co., and Mitsubishi Chemical Industries, Ltd.), and 10% by the Government of Indonesia. The Government will boost its equity stake in the venture to 25% within the next 2 years.[7] The physical construction of the aluminum smelter began on June 8, 1978, at Kuala Tanjung on the Malacca Strait, North Sumatra, and construction of the first gigantic Asahan hydroelectric powerplant started near the Sigura-gura Pintupohan waterfall in North Tapanuli the next day.[8] The Asahan Project's aluminum smelter is proceeding on schedule. The first-stage operational goal is to produce 75,000 tons of aluminum ingots per year when the plant goes into production in 1982. It is to produce 150,000 tons per year in 1983, and upon completion of all facilities in 1984 the smelter would have an annual capacity of 225,000 tons. The Asahan hydroelectric power complex is also proceeding on schedule. It involves three separate projects on the Asahan River: the regulating dam, 16 kilometers downstream from Lake Toba; the Sigura-gura intake dam and the first power station with installed capacity of 286 megawatts, a further 8 kilometers downstream; and Tangga intake dam and the second power station with installed capacity of 317 megawatts, 6 kilometers downriver from Sigura-gura. A 120-kilometer transmission line with 275-kilovolt capacity to carry electricity from power stations to the smelter at Kuala Tanjung will be built. The whole Asahan project also calls for development of a new port at Kuala Tanjung, now being constructed with a 2.5-kilometer-long pier to connect one temporary and three permanent berths to the mainland. These will be for shipping alumina and aluminum ingot from the smelter. When the Asahan aluminum project is completed, the smelter will employ about 2,100 workers and the powerplants about 100 people.[9] It is still unknown as to whether the Asahan smelter would use the Bintan bauxite, which is currently under study for its suitability; otherwise, the Asahan smelter would be likely to use imported alumina from the world market as feedstock in 1982.

P.T. Alco Minerals of Indonesia (ALCOMIN), a subsidiary of ALCOA, had planned to build a 1.6-million-ton mining and an alumina refinery in the Kapuas area of West Kalimantan. The facilities would use an extensive recoverable bauxite reserve discovered recently amounting to 810 million tons along the Kapuas River in the Tayan area. However, the plan appears to have been completely abandoned in view of the high capital costs and adverse conditions in the world markets.[10]

Chromite.—A formal agreement was signed between Indonesia's P.T. Perto and three Japanese firms on a $1 million, 2-year chrome mining exploration project in January 1978. The joint venture, 60% owned by the Indonesian firm and 40% by the Japanese Sulawesi Chrome Development, Ltd. (Kanematsu Gosho Ltd., Kawatessu Trading Co., and Chugain Mining Co.), is currently investigating a 200-square-kilometer area, about 110 miles north of Pare-pare in Sulawesi.

AMAX, Inc., of the United States and the Japanese Kawasaki Steel Corp., a leading stainless steel producer in the world, were also interested in mining chromium in Indonesia for export to Japan. AMAX is interested in black sands containing chromite particles on concession areas held by Indonesian firms in Sulawesi and Halmahera. Kawasaki will reportedly provide $3 million for a 2-year southeast Asia survey, using its own mining expertise, while AMAX will transfer to Kawasaki Steel Corp. 50% of its rights to 10 chromium ore mining concessions in Indonesia and several other southeast Asian countries.[11]

Copper.—P.T. Freeport Indonesia, Inc., (80% owned by Freeport Minerals Co. of the United States, 8.5% by the Indonesian Government, and 11.5% jointly by Nordeutsche Raffinerie of Germany and South Pacific Copper of the Netherlands), is currently the only active primary copper producer in Indonesia. The firm operates its open-pit mine and concentrator (annual capacity, 225,000 tons of copper concentrate) at Gunung Bijih (Ertsberg), Tembagapura in the high mountains of Irian Jaya. The average copper content of the ore was 2.3% and after concentrating, 32.6% in 1978. The capacity utilization of the concentrator has remained at the 80% to 85% level since it reached its peak at 99.2% in 1975.

Exploration work of the Ertsberg East orebody, 2 kilometers east of the existing Gunung Bijih open-pit mine, has been concluded. Ore reserves were reported at approximately 45 million tons, averaging 2.75% copper content plus important gold and silver values. Bechtel has been conducting the engineering feasibility study since 1978. The mining plans are being based on subsurface block caving with a designed mine capacity of 9,500 tons per day by 1982. Estimated cost of the project is $100 million, construction has started in 1979, and the target date for startup of the first phase is mid-1981 with an output level at 4,500 to 6,000 tons per day.

In light of the revival of the export market in 1979, the Indonesian Government agreed to Freeport's plans to open the Ertsberg East underground block-caving operation. The expansion program of Freeport is apparently moving ahead satisfactorily in a very difficult mountainous region of Northeast Irian Jaya. The new prospect will augment production of the existing open-pit mine, which is expected to be depleted by 1983-84.[12]

Exploration work by P.T. Aneka Tambang at the Gn. Limbung deposit near Bogor, West Java, reportedly discovered more than 500,000 tons of ore containing copper, lead, and zinc. At Sangkaropi, South Sulawesi, about 3 million tons of copper ore and associated minerals have been proved through drilling by P.T. Aneka Tambang. Other drilling is still proceeding at Rumangga, northeast of Sangkaropi, by the same firm to find additional copper reserves.[13]

P.T. Tropic Endeavor, a joint venture between P.T. Aneka Tambang and Endeavor Oil Co. (Australia) and N.L. Kennecott Copper Exploration, Ltd. (Australia),[14] reported prospective copper findings at their 282,000-hectare site, block II working area, in North Sulawesi.[15]

The Government of Indonesia signed a contract in 1978 with P.T. Copperindo Utama, (a joint venture between V. Disco Raya Jaya, the Taiwan Metal Mining Corp., and a Mr. Won Yih Yiin), for a concession area covering 2,500 hectares in the Tasikmalaya regency of West Java.

A cooperative agreement between Indonesia and France, for a geological survey in preparation for the mapping and identification of copper and associated mineral deposits in a 48,000-square-kilometer area in Northeast Kalimantan, was signed in February 1979.

Gold and Silver.—The only official statistics on Indonesian gold and silver production is from the Cikotok mine operation on a 5,200-hectare concession in southern Banten, West Java, owned and operated by P.T. Aneka Tambang. The Cikotok mine produced its gold and silver mainly from its Cirotan and Cimari deposits. Gold and silver production dropped substantially in 1978 and again in 1979. The declining trend of gold and silver production over the last several years is simply a reflection of the declining grade of the ore body. However, the high prices of gold and silver have helped the company to maintain a healthy financial condition. In 1979 new processing equipment has been installed and the precious metals smelting and refining plants have been moved from Pasir Gombong to

Pulo Gadung near Jakarta. It is expected that the production levels will rise in the coming years. An unrecorded amount of gold is also produced by the local population in South Kalimantan and Bengkulen using primitive methods. Indonesia has been importing a substantial amount of its domestic requirements for gold for many years.

Freeport Copper at its operation in Irian Java reportedly had shipments of 58,000 ounces of gold and 745,000 ounces of silver in its copper concentrates in 1978.[16]

P.T. Kariskan and Co., a new private mining company, is reportedly starting serious exploration work for gold in the Province of Gunung Mas in Central Kalimantan.

Iron and Steel.—For the past several years, most of the iron sands produced by P.T. Aneka Tambang from the Cilacap mine, and from a new Palabuhanratu beach deposit on the south coast of Java have been exported to Japan. A halt in exports to Japan in June 1978 from these mines, because of a dispute over price and quantity, caused the production of iron sand to drop significantly in 1978 and further in 1979. All of the iron sand produced by P.T. Aneka Tambang in 1979 is consumed by the growing domestic cement industry. In the 1978-79 period, P.T. Aneka Tambang had discovered an extensive beach deposit of iron sand on the south coast of Yogyakarta (Yogya deposit) amounting to 230 million tons of iron ore capable of yielding approximately 28.5 million tons of 59% iron-sand concentrate. An additional 57 million tons of 59% iron-sand concentrate has been found in the area south of Purworejo in Central Java, about 15 kilometers west of the Yogya deposit.[17]

P.T. Karakatau Steel, a State-owned corporation, completed construction at Cilegon, West Java, of the first phase of its steel mill project, and commenced production in October 1979. The steel mill is located in the northwest corner of Java, approximately 130 kilometers west of Jakarta on the Sunda Strait. The plant is the world's largest Hyl direct reduction plant and also is the first steel complex in Southeast Asia which combines reduction, electric arc furnaces, and continuous casting processes. The Hyl direct reduction plant has four modules with four fixed bed reactors in each module. At present, high-quality iron ore pellets imported from Brazil and Sweden are used to feed the direct reduction plant.

The billet plant comprises four 65-ton, 30/36 megavolt-ampere electric arc furnaces, two four-strand continuous billet casters, rod and sectional rolling mills, a 2,000-liter-per-second water treatment plant and pumping station; and a "T"-shaped deep water pier capable of handling bulk carries up to 50,000 deadweight tons (DWT). A supporting facility of a 400-megawatt steam powerplant was also completed in 1978.

With completion of phase I in 1979, the initial plant is now capable of producing annually, 1,440,000 tons of direct-reduced iron; 220,000 tons of wire rod; 150,000 tons of concrete reinforcing bars; 85,000 tons of medium structural sections; 44,000 tons of rerolling billets.[18]

The Government of Indonesia has given the go-ahead signal to West German firms, including Siemens, Klockner, and Ferrostahl, to start phase II construction, which includes the construction of a hot-strip mill and a slab plant capable of producing 1,000,000 tons of flat-rolled steel products, principally steel sheet. The West German Government will provide a DM1.5 billion loan also in the form of export credits, for the phase II construction, which should last 45 months.[19]

Nickel.—After years of active explorations during the early 1970's conducted by the State-owned P.T. Aneka Tambang, together with three large international companies, namely, P.T. International Nickel (INCO), Indonesian Nickel Development Co. (INDECO), and P.T. Pacific Nikkel Indonesia (P.T. PNI), it is estimated that Indonesia now has a reserve of 824 million tons of nickel-bearing laterites.[20] Most of the Indonesian lateritic nickel deposits are found in Sulawesi and the island groups from Halmahera to the bird head of Irian-Jaya including Obi, Gebe, Gag, Kawe, Waigeo, Manuran, and the area of Tanah Merah (Cyclops Mountains). Several hundred million tons of laterite nickel ore were also discovered in East Kalimantan.

Since 1978, there have been two nickel mining companies operating in Indonesia. P.T. Aneka Tambang in the Pomalaa and P.T. INCO in the Soroako area, both on the southeastern arm of Sulawesi. P.T. Aneka Tambang's nickel operation in Pomalaa includes a mine using a combination of labor-intensive and semimechanized methods, and a ferronickel smelter with an annual capacity of 20,000 tons.

The initial Gebe Island project to mine the nickel ore and to build a $460 million ferronickel processing plant was dropped by

INDECO in 1977 due to adverse conditions of world nickel market. Later in 1978, P.T. Aneka Tambang took over the Gebe nickel project and reportedly invested over $2 million for the development of the nickel mine and associated infrastructure.

In April 1979, the director of P.T. Aneka Tambang announced that the firm has exported the first trial shipments of 220,000 tons of unprocessed New Caledonia-type nickel ore from Moluccan on Gebe Island. The firm was expected to export about 800,000 tons of nickel ore annually to Japan beginning in 1979, gradually increasing to 1.4 to 1.5 million tons from Gebe Island after a harbor-and-dock project is completed. A new Gebe smelter complex was reportedly being developed by the firm and INDECO. The target production is expected to be 23,000 to 45,000 tons per year of ferronickel. The Annular Vertical Kiln process developed by Sumitomo Metal Mining Co. was proposed by INDECO for Gebe ores.[21]

P.T. INCO, jointly owned by International Nickel Co. of Canada, Ltd., the Indonesian Government, and six Japanese partners, officially opened its Soroako Phase I operation which includes a large mining and refining facility in South Sulawesi at the end of March 1977. The $850 million Soroako operation is the largest lateritic nickel mining project in the world. Upon completion of Phase II, which involved two additional pyrometallurgical process lines and the construction of a 165-megawatt hydroelectric facility, the total annual capacity was projected to be about 45,000 tons of nickel contained in a sulfide matte.[22] Soroako operation has suffered various mechanical and technical difficulties since it began its operation in late 1977. Most of the difficulties have now been overcome, but the production capacity was still not able to be fully utilized in 1979 (only about 8,600 tons of nickel contained in matte was produced) resulting from the corrosion problem caused by the acidity of the ores. It was determined that an additional $15 million of capital expenditures was required to make process improvements involving installation of better crushing facilities to handle the less acidic ores and crush converter slag, and for modifications to the ore drying facilities. The firm anticipates that upon completion of these process improvements, the annual production capacity will be about 36,000 tons of nickel in a 75% matte, instead of the 45,000 tons as originally projected. Production is scheduled to be about 21,000 tons of nickel in matte for 1980 and about 29,500 tons for 1981, to be exported to Japan.[23]

P.T. Pacific Nickel Indonesia's $1 billion nickel project was still in need of financial backing. It was planned to construct a smelter capable of producing 50,000 tons of nickel metal plus 1,400 tons of cobalt metal per year using the modified Sherritt-Gordon process on remote Gag Island off the western coast of Irian. In light of prospective world market conditions for the coming years, in 1979, the World Bank requested a new feasibility study which would determine whether plans for a 3 1/2-year construction work would be followed.[24] If this Gag Island project successfully materializes during the third 5-Year Plan along with other nickel projects at Soroako and Gebe, Indonesia may well become one of the leading nickel producers in the world.

Tin.—Tin metal mining industry is one of the oldest and the most important industries in Indonesia's hard mineral sector. Indonesia's tin reserves (measured) are estimated at 740,000 to 1 million tons[25] located primarily in the tin islands of Bangka, Belitung (Billiton), Kundur, Singkep, the islets of the Riau-Lingga Group and nearby offshore area, and the Bangkinang area on the mainland of Sumatra.

Indonesia's tin production and exports have increased steadily during 1978-79 as world market prices of tin continued to set record highs. Indonesia tin production hit a new record in 1979 after P.T. Tambang Timah introduced its newest and largest tin dredge, *Bangka II* in 1978. Indonesia's tin exports were valued at $311 million in 1978, up 24% from 1977 at $251 million, and showed another record of 21% increase in 1979 at $376 million.[26]

Indonesia is currently ranked the fourth largest tin producer in the world after Malaysia, Thailand, and Bolivia, and is expected to be the second or the third largest tin producer with its annual production passing the 30,000 ton level in 1980 or 1981.[27]

Indonesian tin mining is primarily carried out by the State-owned tin company, P.T. Tambang Timah and three other joint-venture companies: P.T. Koba Tin (since 1971), P.T. Broken Hill Proprietary Indonesia (since 1971), and P.T. Riau Tin Mining, Ritin (formerly, the Dutch N.V. Billiton Exploratie Maatschappij Indonesia). P.T. Tambang Timah (P.T. Timah), continues to be the single largest producer, contributing about 88% of the country's total tin production. It utilizes dredge and hydraulic mining to exploit alluvial tin deposits inland and dredges offshore of the islands of Bangka, Belitung, Singkep, and at the Bangkinang area of the mainland of Sumatra. The firm has 30 bucket-line dredges (including the new *Bangka II*, but excluding 10 small dismountable dredges) and about 175 hydraulic mines supported by other equipment and facilities. *Bangka II* is the firm's newest 22-cubic-foot dredge with 151 dredging cups, a maximum depth capacity of 150 feet, and capable of mining 4.86 million cubic meters of ore annually. It was introduced in October 1978 and was operating at Air Kantung, Sungai-Liat, and Bangka. In April 1979, P.T. Timah signed a contract with the Dutch Mining and Transport Engineering N.V. of Amsterdam for construction of another dredge called *Belitung I*, which was to be built on Batam Island in Indonesia. The *Belitung I* will have a capacity of producing 1,100 tons of tin ore annually and was to be completed by December 1980 at an estimated capital cost of $25 million (including $2 million for the spare parts). Ancilliary equipment including four tugboats and three barges was to be built at a domestic yard by the U. S. firm P.T. McDermot Indonesia as a subcontractor to the Dutch firm, at a cost of $1.6 million.

P.T. Timah also operates a tin smelter (Peltim) at Mentok on Bangka Island. The smelter has three old West German rotary furnaces and three new conventional reverberatory furnaces with total annual capacity of 33,000 tons of tin metal. P.T. Timah began a $2.5 million smelter expansion project, which was to raise its annual smelter capacity to 41,000 tons by 1980. Capacity utilization has been at an average of 75% for the past several years.

P.T. Koba Tin, a joint venture tin company (75% owned by Kajuara Mining Corp. Pty, Ltd., of Australia and 25% owned by P.T. Tambang Timah) operates both offshore and onshore. The firm has mines at its Nibung property and another property at Lubuk Besar in the Koba District of Bangka Island. Its tin production in 1978 had tripled over that of 1976 and was accounting for approximately 10% of Indonesia's total tin production. At full capacity it expects to produce about 3,000 tons per year of tin concentrates. P.T. Koba's tin is smelted and marketed by P.T. Timah.

P.T. Broken Hill Proprietary Indonesia, the second joint-venture company, a subsidiary of the Broken Hill Proprietary Co., Ltd., of Australia, is concentrating its efforts on rehabilitating a formerly Dutch-owned Kelapa-Kampit underground tin mine on Belitung Island and, in the process, produced about 430 tons of tin concentrates in the 1978-79 period.

P.T. Riau Tin Mining, the third joint venture tin company formed in December 1977, has completed under its former name, Billiton Exploratie Maatschappij Indonesia, N.V., its exploration work around the P. Tujuh islands between Bangka and Singkep. The firm began operation in mid-1979 after its new *Bima*, a sea-going dredge bigger than *Bangka II* arrived. *Bima*, ordered from International Construction, Holland, designed by Mining and Transport Engineering, N.V., of Amsterdam, and built at the Jurong shipyard in Singapore, has a bucket capacity of 30 cubic feet, capable of recovering 1,836 cubic meters per hour of tin ore with 137 buckets at a maximum depth of 150 feet. The *Bima*, the world's largest tin dredge is reportedly having technical problems and delays and may have to be returned to the Jurong shipyard in Singapore for repair.

Indonesia's current tin production primarily relied on the aging 30-dredge fleet of P.T. Timah and its depleting onshore tin deposits. For the past several years, a variety of modern methods of exploration, combined with a modern insight in the geological features of offshore tin deposits had helped Indonesia to discover a great many number of rich tin deposits offshore in the Tempilang area in South Bangka and the Penyusu-Kebiang area in North Bangka. The more recent exploration around offshore areas of Singkep indicates that prospective tin deposits are at 30 to 45 meters below sea level in the areas of Kundur, Laut, Kobil-Laut, and Laut Timun. The proven offshore tin reserves near the Bangka area are now estimated at about 1 million tons. Indonesia, with these vast and rich tin reserves offshore and new additions of large offshore dredges, may well become the world's second largest tin producer by the early 1980's.

Uranium.—The Indonesian Atomic Energy Institute continued exploration in 1978-79 for radioactive minerals in a number of areas in the central part of Kalimantan. On April 14, 1978, two amendments to the initial 1969 agreement between Indonesia and France for cooperation in carrying out uranium exploration in Kalimantan was signed. The amendments provide that if uranium deposits are found to be economically exploitable, the "French side shall be invited for negotiations concerning their mining." Exploration was to be ended by 1979. The two radioactive bearing minerals discovered so far are uranite and monazite in the Nanga Pinoh District near Sintang in West Kalimantan Province.

Another cooperative agreement on a geological survey between the Governments of Indonesia and France was signed on February 15, 1979, for a preparation of the mapping and identification of copper, uranium, and other mineral deposits in a 48,000-square-kilometer area in the northeastern Kalimantan. The French institution named to carry out this survey was Geological and Mining Research Development, which has started to conduct a similar survey in Nusatenggara Island between Lombok and Timor in September 1977.[28]

Indonesia ratified the Nuclear Non-Proliferation Treaty in November 1978.[29]

NONMETALS

Cement.—As a result of an active expansion effort, Indonesia has reached a production level which not only met the domestic demand (about 4 million tons) but also had made Indonesia a net exporter of cement when the first 50,000 tons of portland cement was exported to Thailand in October 1978. Total cement exports increased substantially in 1979. It is expected that Indonesia's cement production will reach 7 million tons in 1980 with a surplus of 1.4 million tons available for exports to India, Bangladesh, Sri Lanka, Thailand, and Nigeria.[30] The Indonesian cement industry had a total annual capacity of 5.9 million tons in 1979 and this capacity was to continue to be expanded with strong government support until it reaches 10 million tons by 1985. As of mid-1979, the Indonesian cement industry comprised the following seven State-owned cement companies:[31]

Company	Plant location	Annual capacity (tons)
P.T. Semen Gresik	Gresik, East Java.	1,500,000
P.T. Semen Cibinong	Narogong, West Java.	1,200,000
Indocement (PICE)	Citeureup, West Java.	1,000,000
P.T. Distinct Indonesia Cement Enterprise (DICE)	Citeureup, West Java.	1,000,000
P.T. Semen Nusantara	Cilacap, Central Java.	660,000
P.T. Semen Padang	Indarung, Sumatra.	330,000
P.T. Semen Tonasa	Ujung Pandang, South Sulawesi.	110,000
Total capacity	---------	5,800,000

Several other expansion projects were still underway. P.T. Semen Padang was constructing a new 2,000-ton-per-day dry process plant next to its existing Indarung wet process facility in Western Sumatra. Although the construction was delayed (6-9 months) for technological reasons, at the completion of this new 600,000-ton-per-year-capacity plant, P.T. Semen Padang would have an annual capacity of about 1 million tons.

P.T. Semen Tonasa's new 1,650-ton-per-day dry process plant at Biringere Sulawesi was also scheduled to be completed by 1980. The operation, called "Tonasa II," was to have an annual capacity of 500,000 tons added to the firm's existing capacity of 110,000 to 120,000 tons per year.

P.T. Semen Cibinong had decided to expand its production capability of 1.2 million tons to about 2.1 million tons through a progressive modification program. One of the programs was a complete production line of 3,200-ton-per-day capacity.

P.T. Semen Baturaja was building a turnkey 500,000-ton-per-year dry process suspension preheater plant, scheduled to begin production in 1980. The Japanese firm, Kawasaki Heavy Industries was to set up two grinding plants at Palembang and at Panjang and IHI to build a clinker-producing plant at Baturaja in South Sumatra.

Fertilizer.—With effective use of domestic natural gas and an aggressive expansion program, Indonesia's fertilizer industry made substantial progress during the 1978-79 period.

P.T. Pupuk Sriwijaya (P.T. Pusri), the State-owned fertilizer company, operated ammonia/urea fertilizer plants at Palembang, South Sumatra, utilizing natural gas as feedstock, with combined (Pusri I, II, and III) capacity of 910,000 (537,000 tons of urea and 372,000 tons of ammonia) tons annually. By 1979 P.T. Pusri had completed an additional plant (Pusri IV) with a designed annual capacity of 262,000 tons of urea and 272,000 tons of ammonia. A fertilizer plant's bagging unit at Ujungpandang with a capacity of 100,000 tons per year, was also completed at a cost of $12.3 million. The ASEAN fertilizer complex, with an annual capacity of 262,000 tons of urea and 272,000 tons of ammonia in North Aceh was expected to start construction by the end of 1979. This ASEAN fertilizer project will cost an estimated $313 million, of which Japan will provide $220 million in loans. The remaining $93 million will be provided by Indonesia, 60%; Malaysia, the Philippines, and Thailand, 13% each; and Singapore, 1%. The whole construction was to last 36 months and to be completed by 1983. Contracts for construction and design had yet to be awarded by year end 1979.[32]

P.T. Petrokimia Gresik, the second State-owned fertilizer company, operates one urea plant with an annual capacity of 45,000 tons and a 150,000-ton ammonium sulfate plant near Surabaya in East Java, both using petroleum feedstock. The firm has also started to build a TSP (triple superphosphate), DAP (diammonium phosphate) and NPK (nitrogen, phosphorus, and potassium) plant with an annual capacity of 460,000 tons. The construction of this plant was expected to be completed in 1979.

In 1978, Indonesia became a major supplier of nitrogen fertilizer in Asia. The export of fertilizer, like cement, is subject to the government's control. In 1978, it was reported that Indonesia had started to export a few hundred thousands tons of urea to various countries in Asia includes India, Vietnam, and Zambia in Africa. The export volume was lower in 1979 than in 1978.

Besides the new ASEAN plant at Aceh, which was proceeding more or less on schedule, two more fertilizer plants were being planned and constructed: P.T. Pupuk Kujan near Cikompek on Java, and P.T. Kaltim at Muara Badak in East Kalimantan.

Other Nonmetals.—Indonesia also produces limestone and small amounts of iodine, granite, and kaolin. Kaolin in Indonesia is produced in Bangka, Belitung Island, and North Sulawesi. Most kaolin is for the consumption of the domestic ceramic, paint, and cosmetic industries. Granite is primarily produced by P.T. Karimum, a 50-50 joint venture between P.T. Indophing and the Malaysia Gammon Southeast Asia Sdn. Berhad on Karimun Island. The crushed rock is mainly for the consumption of domestic construction industry.[33] Some material has been exported to neighboring countries for the past several years. Iodine is produced in East Java from iodine-bearing brines by P.T. Kimia Farma at Watudakon near Mojokerto. The production of iodine continued to decline. There was no export in 1978.

MINERAL FUELS

Coal.—An era of development and progress in Indonesia's coal industry finally began in 1979. P.N. Tambang Batubara, the State-owned coal company, suffered a major setback in July 1978 when Shell withdrew from its production contract to expand the capacities of existing mines in Bukit Asam, South Sumatra.[34] Shell cited as the reasons for putting off production the problems of the coal quality related to high moisture content, the presence of sodium in the coal, pollution problems related to the presence of lignite in Shell's reserves, and the depressed market.[35] Shell's initial $1 billion coal mining and power generation project in South Sumatra later was awarded to a Canadian consortium comprised of Montreal Engineering Co., Swan Wooster Engineering, Inc., and Canadian Pacific Services.

The project involved an expansion of the existing production from the Bukit Asam coal mines to 2.2 million tons per year by 1984 and a new rail-and-sea transportation system for moving the coal to two 375-megawatt power generation stations, one of which is scheduled to begin supplying electricity to Jakarta and its surrounding area in 1984. The cost of the project was estimated at $1.07 billion, including $100 million for the cost of mine development and expansion, $450 million for the two generation stations at Suralaya, West Java, $84 million for railway, $85 million for sea transport facilities, and $350 million for transmission lines and grid.[36]

Following Shell's withdrawal from the production contract in September 1978, the Government of Indonesia through P.N. Tambang Batubara invited 22 foreign contractors to submit proposals for the reopening of its coal mines including significant deposits at Mahakan in East Kalimantan, which have been closed down for economic reasons. Successful bidders for eight coal concession areas along the coast of East Kalimantan were Mitsui and Nissho-Iwai of Japan; Rio Tinto, Inc., of Britain; Utah International, Inc., and Arco, Inc., of the United States; a Japanese consortium; and Yul San Co., Ltd., of South Korea, which dropped out later because of bankruptcy. Various production-sharing contracts were being negotiated during mid-1979. Exploration activities began immediately following the letting of the contracts.[37]

Petroleum and Natural Gas.—Indonesia oil output level was off in 1977, beginning a decline that continued through 1979. This declining trend was primarily due to a noticeable slowdown in oil exploration activities by the contractors during the 1975-77 period. However, Indonesia's oil production is expected to increase again starting in 1981 and reach 1.8 million barrels per day by 1983. This is to be the result of intensified secondary recovery from onshore and offshore oil wells and additional exploratory wells induced by a new "joint-venture production-sharing arrangement."[38] This new arrangement calls for a 50-50 sharing of all exploration, investment, and production costs by the interested party (the contractor) and the State-owned oil company (Pertamina).

Indonesia exported about 75% of its crude oil produced during the 1978-79 period. Of the total crude oil exported, about 45% went to Japan and 34% to the United States in 1978; about 57% went to Japan and 30% to the United States in 1979.[39] Although Indonesia's crude oil exports declined in volume, exports earnings from oil rose from $4.6 billion in 1978 to over $6 billion in 1979.

Under the third 5-Year Plan, Indonesia was to increase its oil production and expand its refineries. In 1978, about 130 exploratory wells were drilled and an offshore oilfield, southeast of Sumatra, was discovered. This new offshore field was to begin production in 1979.[40] During 1979, a total of 14 new production-sharing contracts were signed by Pertamina with numerous foreign oil companies. These contractors include Chevron Jambi, Inc., and Texaco Jambi, Inc., for onshore exploration in South Sumatra and offshore exploration near the Natuna islands; Indonesia Cities Services, Inc., for offshore exploration in the East Java Sea; Mobil Oil Indonesia for offshore exploration east of Aceh in North Sumatra and two offshore exploration programs around the Natuna islands in the South China Sea; Marathon for offshore exploration near the Natuna islands; Royal Dutch Shell Group for onshore exploration in Southern Irian Jaya; Esso for offshore exploration near the Natuna islands; and Phillips/Amoco for two onshore exploration programs in Irian Jaya. The total foreign oil companies' investment in Indonesia oil exploration rose from $230 million in 1978 to over $300 million in 1979.[41]

In line with the third 5-Year Plan, Indonesia would expand its Cilicap refinery in Central Java from its current 100,000-barrel-per-day (bpd) capacity to 300,000 bpd by 1982; its Dumai refinery in Sumatra would be expanded by 85,000 bpd and equipped with a hydrocracking plant; and its Balikpapan refinery in East Kalimantan would also be expanded to 260,000 bpd from 60,000 bpd. By the end of 1983, Indonesia's total refining capacity was projected to reach 800,000 bpd from the current 400,000 bpd.[42]

Following discovery of large deposits in Arun Aceh in North Sumatra and Badak in Eastern Kalimantan, Indonesia's gas production had tripled during the 1976 to 1978 period. The gas production reached an all-time high of 1 trillion cubic feet in 1979.

Indonesia's utilization of natural gas rose sharply during the 1977 to 1979 period and is expected to continue to rise through 1983. This rapid increase is to be a result of increasing use of natural gas as a raw material in expanding fertilizer production as well as an energy source in the fast growing cement, steel, and utilities industries. The domestic utilization of natural gas was further boosted by two newly opened LNG plants. The Arun LNG plant at Blang Lancang in Aceh, North Sumatra, started its operation in September 1978. The plant operates three trains capable of treating 24 million cubic meters per day of gas and producing about 4.8 million tons of LNG annually. The Bontang LNG plant in

Badak, East Kalimantan, had started its operation in August 1977 with two trains capable of treating 15 million cubic meters per day of gas and producing about 3.3 million tons of LNG annually.[43] Indonesia's LNG production was at the 6-million-ton level in 1979. This level was to be raised to 7.5 million tons in 1980 by adding four trains to the Arun plant and two trains to the Bontang plant. It was projected that the LNG production would reach 10.2 million tons in 1982 and 13.9 million tons in 1983.[44] Indonesia exported most of its LNG to Japan by specially built ocean-going vessels. In 1979, LNG exports earned over $500 million in foreign exchange.[45]

In 1979, Indonesia completed its West Java natural gas pipeline. The installation of this pipeline would enable Indonesia to save previously wasted natural gas.[46]

The Mineral Industry of Iran

By Janice L. W. Jolly[1]

Beginning in late 1978 and continuing into 1979, the mineral industry of Iran suffered from the traumatic events of a revolution, which was to severely affect the Iranian economy. In 1978, Iran's economy and society had begun to reflect the strains resulting from a rapid-pace development following the post 1973 oil boom. As early as 1977 the Government had recognized some of the problems and had decided to take a number of deflationary measures to cool the economy. Inflation and wage demands, which had reached rates of 40% or more, needed to be curbed. Other negative factors such as capital flight, low private investment, uneven distribution of income, and shortages in labor, housing, and social services further aggravated the economy. By September 1978, the situation erupted into widespread civil and economic disorder which recast Iran's entire economic course. At yearend 1978, oil production was reduced to less than domestic needs, the banking system was crippled, the construction sector was paralyzed, and such Government services as customs, essential to industrial production, were paralyzed. Unemployment became massive in 1979, which was estimated at 35% of the labor force. Strikes in the petroleum refining and distribution sectors resulted in widespread shortages of domestic cooking and heating fuels and Iran was forced to import some essential refined petroleum products. Despite lost oil production for the latter part of 1978 and early 1979, higher oil prices enabled the gross national product (GNP) for Iranian year 1979 to remain nearly the same as Iranian year 1978,[2] estimated at $70 billion[3] at current prices.

By the middle of 1979, new mineral development projects, some as much as 85% complete, had been reassessed by the new revolutionary Government, with some to be abandoned, such as the aromatics plant at Abadan, the Kalingas liquified natural gas (LNG) project, the French nuclear powerplants, and the IGAT-II natural gas pipeline. With loss of expatriate help, most projects were at least temporarily halted. Included in this category were the West German nuclear powerplants (over two-thirds completed), the Italian steel mill at Bandar Abbas, and the Sar Cheshmeh copper complex. Projects that were considered worth continuing included the Iran-Japan petrochemical complex, the Italian-constructed steel plant (to be relocated near Isfahan) Sar Cheshmeh and the gas recovery-reinjection (although modified) project in Khuzestan. Most foreign firms with outstanding contracts or joint ventures in Iran resumed contact with their Iranian colleagues after the revolution, but with differing results. In general, the Iranians sought a lower expatriate presence. Iran's formerly large foreign population was reduced to a few thousand legally documented workers. American involvement became particularly impossible by yearend 1979.

By August 1979, Iran had a cash-flow problem and the economy was sinking into deep depression. Despite months of unrest and disruptions of the economy, Iran was flush with cash from oil revenues, collected and deposited in foreign bank accounts throughout the world, but with most of the industrialization projects canceled there was little way of spending it. The whole posture of the new Government had been to cut and dismantled. There were no new economic plans for growth or industrial future of the country. A severe liquidity crunch occurred as Iranians held their savings out of banks, taxes went unpaid and uncollected, and a widespread rebellion occurred among both private and public workers making it impossible to achieve a steady level of productivity in any industry.

No banks had deposits to lend, the Government slashed the budget by one-third, and huge raises of up to 400% were given to all Government workers to appease industrial unrest. A sudden end to the construction industry, a mainstay of Iran's economic boom, and an acute shortage of raw material spare parts and intermediate goods because of import disruptions combined to further strangle the economy.

In July 1979, the nationalization of banks, insurance companies, and most metal-processing and mining operations contributed to a growing pessimism of the international banking and investment community. Formerly regarded a good credit risk, Iran became a very uncertain risk by yearend 1979. The ambitious plans for modernizing Iran had called for large loans; Iran's total indebtedness was estimated at $6 billion, with $2.5 billion owed to U.S. banks. Most of Iran's foreign exchange, estimated at $9 billion, was also held in U.S. banks. On November 12, 1979, the U.S. Government officially froze all Iranian assets and funds held by U.S. banks and their foreign subsidiaries. Since most Iranian trade had been conducted in U.S. dollars, this was to have far-reaching consequences. By November 19, Iran had defaulted on interest payments due and several U.S. banks acted to accelerate the loans, demanding repayment and seizing Iranian assets in compensation. Morgan Guaranty Bank of the United States also made a successful move in the Federal Republic of Germany courts to attach the 25.02% Iran stake in Friedrich Krupp Hüttenwerke AG, the German steel and engineering corporation. Iran, in return, requested all future oil payments to be made in other currencies or to other banks.

PRODUCTION AND TRADE

Crude petroleum production for Iranian year 1978 was valued at $18.9 billion, down 9.2% compared with receipts of $21 billion for 1977. Although crude petroleum production was drastically reduced through much of 1979, higher prices resulted in revenues similar to the previous year. Petroleum prices, which had been relatively stable in early 1978, began to respond to the supply crisis generated by the Iranian revolution at yearend. The Organization of Petroleum Exporting Countries (OPEC) price agreement of a 10% increase for 1979 was a compromise between moderates and others who pressed for up to a 20% increase. Iran was to institute a 29% increase by April 1979, when Iranian light crude, which was priced at $12.81 per barrel in December 1978, was raised to $16.57 per barrel. By yearend 1979, Iranian light was selling at the official price of $23.50 per barrel and spot prices were as high as $43 per barrel. Iran was accepting only German marks, Japanese yen, or French francs as payment for oil after the United States froze Iran's dollar assets in late 1979. By yearend 1979, production was averaging 2.9 million barrels of crude oil per day, down from the 4 million barrels per day reached earlier in the year. Iran was diverting most production to exports to be sold mostly on the spot market at premium prices. Iran was planning to reduce its oil production further in 1980, and to look for even higher prices.

In 1978, the Oil Service Co. of Iran (OSCO) exported 989 million barrels of crude oil. National Iranian Oil Co. (NIOC) direct exports were 432 million barrels, and NIOC joint venture exports were 210 million barrels of crude oil. As a response to crude oversupply and poor demand of world markets early in 1978, Iran's exports had fallen back by nearly 16% to 4.75 million barrels per day. In April 1978, Iranian crudes were selling at discount rates in spot markets. By October 1978, however, the surplus of petroleum that had troubled the world's oil companies for the past year and a half, holding prices down, evaporated in the wake of the political turmoil in Iran. At mid-year 1978, as companies began to stockpile petroleum in anticipation of a January OPEC price increase, Iranian exports of crude and refined products averaged 5.1 million barrels per day for the 9 months ending September 22, which was only 2.1% lower than the 1977 average. Exports plummeted during October, however, to less than 1 million barrels per day, and on December 27, 1978, ceased altogether until March 1979. Exports of crude petroleum for 1979 averaged about 2.8 million barrels per day.

Nonoil exports, including other minerals and natural gas, were valued at $450 million for 1978, down about 14% compared with Iranian year 1977. Mineral ore exports formed about 3% of the total nonoil export value. Natural gas exports to the U.S.S.R. were about 614 billion cubic feet in 1978. Natural gas production and exports were halted for a period of about 3 months during the peak of Iran's political crisis. Resuming deliveries in April 1979, Iran supplied only about 35% of the normal natural gas provision to the U.S.S.R. for all of 1979. Iran's agreement with the U.S.S.R. to supply gas was to expire in 1985.

NIOC had a direct investment in a 42-inch Israeli crude oil transit pipeline between the Red Sea port of Eilat and Ashkelon on the Mediterranean. The line opened in 1970 for delivering Iranian oil to the Mediterranean for various customers and had a 1-million-barrel-per-day capacity. Delivery over the line ceased at the beginning of 1979.[4]

Table 1.—Iran: Production of mineral commodities[1] [2]

(Metric tons unless otherwise specified)

Commodity	1976	1977	1978[p]	1979[e]
METALS				
Aluminum, primary ingot	30,600	21,100	25,500	14,000

COMMODITY REVIEW

METALS

Aluminum.—The Alcan Aluminium Ltd. (Canada), feasibility study for the proposed 150,000-per-ton-per-year aluminum smelter at Bandar Abbas was completed at yearend 1978. The cost of the project was estimated at $600 million. Power for the smelter was to be derived from domestic gas. At yearend 1979, however, this project was being reviewed by the new Government. The capacity of the Iran Aluminum Co. (IRALCO) smelter at Arak was being expanded to 125,000 tons per year. This expansion was expected to be completed by 1981. IRALCO had placed an inquiry for long-term supply of 150,000 tons per year of alumina from Japanese producers to cope with the planned expansion of the Arak smelter. IRALCO was now owned 95% by the Iranian Government, 4% by Reynolds Metals, and 1% by the Pakistan Government. Owing to power supply problems, the plant has had to operate at well below its rated capacity of 45,000 tons per year.

Copper.—As a result of the political and economic crisis, smelter operation and work on the Sar Chesmeh refinery was delayed. The National Iranian Copper Industries Co. (NICIC) was also to delay the first exports of blister copper. Exports totaling 120,000 tons had been contracted for delivery to Western Europe, Japan, and the United States by March 31, 1979, but by late 1978, little mining was being done, and the concentrator was not running at all. More seriously, construction of the smelter was halted, although the first furnace was due to be fired in January 1979; it was not commissioned until late in 1979. Shortage of fuel and power from the national grid, departure of U.S. expatriates, and disruption of banking and postal services and exchange controls making it impossible to get spare parts, were all causing production problems. When work became impossible, Anaconda Co. of the United States declared force majeure in January 1979 and canceled its contract in May 1979. Anaconda had finished 4 of its 7-year contract as technical advisor to NICIC. In June 1979, NICIC informed Parsons-Jurden of the United States and the Krupp-Mechim (West German-Belgium) joint venture that they could continue work on the project, but it was doubtful that the contract date for completion of the refinery by 1981 would be met.

Until the slowdown began at yearend 1978, the Iranian Mining and Metal Smelting Co. (IMMSC), under the Ministry of Industry and Mines, had also been active in development of several copper mines. These included the Talomsi, Maskani, Abbasabad, Chahar-Gonabad, and Mazra'eh copper mines. Output from the Talomsi and Maskani mines was estimated at 800,000 to 1 million tons of ore per year. The plant crude ore capacity at the Talomsi copper mine was 150 tons per day, producing a 35% to 40% copper concentrate. Geophysical and geochemical studies were completed at the Abbasabad copper mine, and 800,000 tons of extractable ore with 1% to 1.5% copper were determined with potential reserves of about 1.2 million tons. Installed 7 years ago, the Abbasabad concentrator had a crude ore capacity of 150 tons per day producing 35%

copper concentrate. Current output of the Abbasabad Mine was only 80 tons of crude ore per day, most of which was being used by the Military Industries Organization of Iran. A second concentrator, with a 300-ton-per-day crude ore capacity, was to be installed. The available reserves at the Chahar-Gonabad copper mine was determined to be 2.9 million tons of 1.8% to 2% copper. Plans were to install a 300-ton-per-day flotation plant at Chahar-Gonabad during the sixth development program. The Mazra'eh copper mine was closed for a time in 1978 but was reopened with a 200-ton-per-day concentrator, and plans were being made to install a larger plant. The Mazra'eh Mine was estimated to have over 270,000 tons of 1.42% copper by a recent drilling program.

Other copper mines with activity in 1978 were described as follows: The Delijail copper mine, located 120 kilometers from the Tehran to Firuzkooh Road, renewed production after being shutdown since 1970. The mine was producing about 150 tons of copper ore per year and had an average grade of 6% copper. The Calateh Mehran Mine, located 110 kilometers southeast of Semnan, was also producing 150 tons per year of 7% copper ore. The Dovveh Taghi Mine, located south of Tarom, produced about 300 tons of ore per year with an average 4% copper.[5]

Iron Ore.—Iron ore for the National Iranian Steel Industries Corp. (NISIC) works at Ahwaz was to be initially imported from Kudremukh, India, but was expected to be supplied domestically from Iran's Gol-e-Gowar deposit by 1981. By yearend 1979, Iran was revising its contract for the construction of the Iran-financed pelletization plant at Kudremukh. The Iranian Government wanted to reduce its investment because it felt Iranian needs of iron ore pellets would not be on the scale originally visualized. National Iranian Steel Corp. (NISC) was obtaining iron ore from the Choghart deposit near Bafq, located approximately 540 kilometers from the plant. The Semnan iron ore mine was closed. Exploration for more iron ore reserves continued. Latest studies indicated Iran had about 1.6 billion tons of known iron ore reserves and projected reserves of 3,500 million tons.[6]

Iron and Steel.—By 1985, the finished steel capacity for the entire nation was planned to be 8 million tons per year, enough to meet domestic needs, but considerably scaled down from the original target of 14 to 16 million tons per year. Already about 70% completed, expansion at the NISC Aryamehr steel plant at Isfahan was to be continued. In August 1979, Iran and the U.S.S.R. agreed on an amended expansion plant that would cost about $369 million. Already the largest steel producer in Iran, producing about 550,000 tons of steel per year, NISC was scheduled to produce 2 million tons per year of pig iron and 1.5 million tons per year of raw steel. Established in 1973, NISIC had potential to surpass the NISC production at Aryamehr, but was still under development. NISIC's first direct reduction plant at Ahwaz went into production early in 1978 with an initial capacity of 230,000 tons per year. Two other direct reduction plants were also under construction at Ahwaz.

Even though some contracts had already been signed, progress on most projects was stopped or slowed down as the new Government reconsidered them, and equipment orders were canceled or delayed. Italimpianti, which had a $1.5 billion contract to supply equipment for the new steelworks at Bandar Abbas, renegotiated its contract in 1979. The plant was to be located near Isfahan under the terms of the new contract. After a period of suspension in early 1979, the Iranian Government asked the two West German companies, Lurgi Gesellschaften and Korf Stahl, to complete work on the pelletizer and Midrex direct reduction units at Ahwaz. Iranian Special Steel CO. (ISSCO) a joint venture with Creusot-Loire of France (30%), suspended plans for the special steel plant at Ahwaz after a number of delays.

Lead and Zinc.—According to the Iran Economic Service, about 75% of the lead and zinc mines in Iran had stopped working by early 1978, and the country had become an importer of industrial lead and zinc. The reasons given for mine closure were generally: (1) An increase in workers wages; (2) a drop in lead ore price in international markets; and (3) nonreturn of capital investment. Expansion at the Angouran Mine was delayed indefinitely. Even so, the mine had attained one-third of the production target with an annual production capacity of 100,000 tons of concentrate containing 60% lead and over 54% zinc. The Shahkuh, Kushk, and other smaller mines had a production capability totaling about 500,000 tons of lead-zinc concentrates, but these mines were operating at only about 50% capacity through the 1978-79 period.

The IMMSC was responsible for exploration and exploitation of lead-zinc deposits in several parts of Iran. In recent years it had spent more than $400 million on lead-zinc development including the lead mines of Nakhaluk, located near Zanjan, and the Zachkan and the Uzbashi-Chi Mines. Exploration and mining activities at the Nakhaluk Mine had reached the 160-meter depth in 1978. The concentrator capacity had been increased from 100 to 150 tons per day, and about 10,000 tons per year of 55% lead concentrates were being exported. IMMSC was also completing a new concentrator at the Nakhaluk Mine with an initial capacity of 600 tons of ore per day, later to be increased to 1,000 tons per day. At the Qanat Marvn lead mine, a new concentrator of 100-ton-per-day capacity was initiated. The output of the mine had been increased to 1,000 tons per year of 45% lead concentrate. Initial exploration of the Aria Chai lead mine was complete in 1978.[7]

NONMETALS

Cement.—The Aryamehr cement plant at Isfahan started operation in May 1978 and reached full operation with an initial 5,000-ton-per-day capacity in September. Full capacity was expected to reach 3 million tons per year. The plant, equipped with automatic machinery, was started in 1975 at a site located 40 kilometers southwest of Isfahan. The plant was a joint venture by the Military Procurement Organization and the NISC that hold 80% and 20%, respectively. Three diesel generators were installed to produce 50 megawatts of electricity. The National Iranian Gas Co. (NIGC) was constructing a pipeline to supply natural gas to the plant, whereas in 1978, gas was supplied by cylinders. The plant cost $230 million to build.

Cement production in 1978 was about 12 million tons. The country's requirements were estimated at 9.7 million tons, and local consumption had been increasing by 22% per year. Before the revolution, Iran had expected to become an exporter of cement with increased capacity outstripping consumption. By 1979, however, cement production was averaging about 25,000 tons per day. Domestic demand also dropped as construction projects were canceled. Construction permits were no longer required for the purchase of cement.

Gypsum.—Gypsum was being produced by the IMMSC and the Tehran Gatch Co., Ltd. With construction continuing at high levels, about 7 million tons of plaster was made during Iranian year 1978, which was about a 20% increase over the previous year.

Fluorite.—Several new deposits were producing about 9,000 tons per year for use in the local steel industry.[8]

Phosphate Rock.—The French Bureau de Rècherches Geologiques et Miniéres (BRGM) was doing mineral prospecting and mapping in Khorassan and, in 1978, was requested by the National Petrochemical Co. (NPC) to undertake technical-economic studies of previously discovered phosphate deposits located south of Isfahan.

Strontium.—Strontium Co., a subsidiary of the Simiran Group, was producing 15,000 tons per year of hand-sorted celestite ore from the Nakhjir deposit. Located in the northwestern part of the salt desert Dasht-i-Kavir, and southeast of Tehran, the celestite was sold to the U.S.S.R. and Japan on a minimum 90% $SrSO_4$, maximum 2% $BaSO_4$, and maximum 2% SiO_2 basis. The average $SrSO_4$ content of the deposit was 91.48%, which could be upgraded to 94% by hand sorting. Reserves were given as 1 million tons of proven ore, and 3 million tons of possible ore. Mining was by opencast extraction along the crest of the hill. The deposit, with an average thickness of 2.5 meters, was a stratiform occurrence in a marine marl (gypsum)-clay-limestone sequence that extended over a distance of 4 kilometers.[9]

MINERAL FUELS

Coal.—The NISC reported the discovery of new coal deposits in the southern part of the Dasht-i-Kavir salt desert. The discovery, located between Naiband and Tabas, was the result of a joint exploration effort by Iranian and Russian geologists who have been exploring a 100,000-square-meter area of the salt desert for coal, iron, and water for the past year. Reserves in this area were estimated at 20 billion tons.

Production of coke for the Iranian year 1977 was increased by 1,200 tons compared with the previous year. The coke section at the Aryamehr Steelworks also produced 2.5 billion cubic meters of usable coke gas and 400 tons of phenol. Tar (114,000 tons), ammonium sulfate (24,800 tons), and sulfuric acid (18,400 tons) were other byproducts produced. Coke consumption at the Aryamehr Foundry was decreased from 715.8 kilograms to 507 kilograms for production of each ton of cast iron.[10]

Natural Gas.—Associated and nonassociated proven gas reserves were estimated at 800 trillion cubic feet and about 20% of the proven world reserves. By 1979, Iran had decided in principle not to go ahead with any new schemes to export gas by pipeline or in liquified form. Deliveries of natural gas to the U.S.S.R. were also severely curtailed, and were estimated at about 56% of the contracted volume in July 1979. Production in early 1978 was about 5.6 billion cubic feet per day. About 48% of the gas was being flared, compared with 90% in the early 1960's. About 31% of the gas utilized was used in the secondary petroleum recovery, gas-injection program, 30% was being exported to the Soviets through the IGAT-1 pipeline, 10% was used domestically, and about 17% was used as feedstock for natural gas liquids and petrochemicals.[11] Natural gas deliveries to IGAT-I ceased in October 1978, started again on November 19, only to be terminated again in early 1979. Prerevolutionary levels of daily gas exports to the U.S.S.R. stood at 895.6 million cubic feet daily. During 1979, there was a shortage of associated gas for export because of reduced crude oil production. The export portion of the IGAT-II pipeline project was canceled because it was considered uneconomical and not in the nation's interest.

In 1978, NIOC announced that gas reinjection in the Khuzestan oilfields had raised the oil recovery factor by 5% to 10%. Without these secondary recovery measures, oil pressures and production in these fields would drop. Gas requirements for the injection program were expected to amount to 8 billion cubic feet per day, but this demand may be modified under the new national directive. This program was approved for continuing under the new Government; but, by yearend 1979, maintenance in the oilfields was virtually nonexistent and oil pipeline after pipeline throughout the country was being shut down.

By yearend 1978, the LNG (liquefied natural gas) deal with Columbia Gas Systems of the United States was shelved. The Kvaener Group of Norway, as builder and financier of the plant, also withdrew. Columbia and Consolidated Natural Gas, which became joint purchaser of the LNG, were to renegotiate price with NIGC while a new plant builder was sought,[12] but by yearend 1979 negotiations had ceased.

Agreements for the supply of LNG to Japan were signed in 1978 for NIGC to supply Japan Kalingas with 2.8 million tons per year over 20 years starting in 1982. A group of Japanese companies (Mitsubishi Heavy Industries, Ishikawajima-Harima Heavy Industries, Hitachi Shipbuilding, and Kobe Steel) were to construct the $762 million liquefaction plant that reportedly would be ready for operation by 1982. R.J. Brown and Associates were to design and engineer the Pars field gas-gathering system that would move gas from six offshore complexes to an onshore terminal where the condensate would be piped to the Kalingas LNG plant. By 1979, however, the Kalingas project was reported canceled.

The Joint-Stock Ocean Co. of Iran, a joint venture formed in 1975-76 with NPIC and the Ocean Gas Co. of France, received the first Iranian ship designed to transport liquefied gas and ammonia in early 1978. Called the Razi, the ship had a 70,000-cubic-meter capacity and would make its first commercial trip from Kuwait and Saudi Arabia to the United States. In October 1979, two new gas finds near Gachsaran were announced by NIOC and were a sign that the NIOC exploration program was again functioning.

Nuclear Energy.—By early 1979, Iran had decided to scrap its ambitious nuclear energy program. The decision affected the $3.6 billion two atomic powerplants at Büshehr that were being constructed by Kraftwerk Union, a subsidiary of Siemens AG of the Federal Republic of Germany. The Iranian Labor Ministry refused to renew the work permits for 200 Germans working at Büshehr, and two installments of $495 million each had not been paid. By July 28, 1979, Kraftwerk Union withdrew from the project to cut further losses. Work on the plants was 80% complete, and they had been expected to go onstream in 1980, producing 2.4 million kilowatts of electricity. Iran had already paid $2.87 billion to Kraftwerk for the project construction. The new revolutionary Government believed the project to be too costly to maintain. Framatome of France was also affected by this decision as it had contracted for two nuclear plants at a cost of $2.03 billion. The French had been arranging a barter-for-oil deal in payment for the plants.

At mid-1978, Australia and Iran signed a nuclear safeguard pact on the supply of uranium ore. The agreement followed 4 years of interrupted negotiations. Deliveries of 15,000 tons yearly of uranium were to be supplied over a 5-year period beginning in 1980. Preliminary initialing of a final nuclear nonproliferation treaty was also carried out in 1978 with the United States after 2 years of negotiations. An Iranian concession not to purchase a reprocessing plant had broken the negotiations deadlock. By yearend 1979, however, the need for such quantities of uranium was in doubt.

Petrochemicals.—The Shahpur Chemical Co., a subsidiary of the NPC, was upgraded in 1978 to 230,000 tons per year diammonium phosphate and 225,000 tons per year P_2O_5 in the phosphoric acid plant by "debottlenecking." New facilities were constructed including an ammonia plant, a urea plant, and two sulfuric acid units. Expansion of the fertilizer complex at Shiraz was about 75% complete and negotiation for contracts was under way for completion of the project in 1980. The Iran-Japan Petrochemical Co. (IJPC), a joint venture with NPC 50%, Mistui & Co., Ltd. 4%, Toyo Soda 30%, Mitsui Toatsu 15%, Mitsui Petrochemical Co. 5%, and Japan Synthetic Rubber Co. 5%, were to continue building a petrochemical complex at Bandar-e Shahpur, which was 85% complete at yearend 1978. The complex was centered on a 300,000-ton-per-year ethylene unit. At yearend 1979, the Japanese Government was considering the possibility of contributing an additional $228 million for the completion of the project abandoned through most of 1979. Now called the Bandar Khomeini Petrochemical project, gas supplies were guaranteed by NIOC. Parsons Engineering of the United States was to build the gas collection plant under the original contract, but by yearend 1979 none of the Parsons Group was on site and the future of the Parsons contract was under discussion. Work on the Bandar Khomeini project was scheduled to resume in January 1980.

Petroleum.—*Exploration.*—A general decline in exploration efforts continued through 1978-79. Diminex of the Federal Republic of Germany discovered oil in two wells on its tract around Abadan in 1978, but its commerciality was unknown. NIOC's exploration efforts were concentrated near Shiraz.

Production.—Petroleum production for 1978 averaged 5.2 million barrels per day, down almost 9% from the 5.7 million barrels per day produced in 1977. Crude production for the last 3 months of 1978, was to fall to the lowest levels in 26 years because of civil distrubances. In 1978, Iran was producing a ratio of 53% heavy oil crudes to 47% light crudes, which had changed from 52/48 in favor of light crude a few years ago. By 1982, this ratio was expected to be 57% heavy and 43% light crude.

Crude oil producing companies included the OSCO, which produced 89% of the total in 1978, and several NIOC joint ventures. OSCO was owned by British Petroleum (BP) 45%, Shell Oil 14%, Compagnie Francaise des Petroles (CFP) 6%, and by Exxon, Mobil, Texaco, Gulf, and Iricon Agency with 7% each. The joint ventures included: Iran Pan American Oil Co. group (IPAC) (Standard Oil of Indiana 50%, NIOC 55%); the Societe Irano-Italienne des Petroles Group (SIRIP), (Azienda Generale Italiana Petrole (AGIP) 50%, NIOC 50%); the Lavan Petroleum Co. (LAPCO), Atlantic Richfield Co., Murphy Oil Corp., Sun Oil Co., and Union Oil Co., each with 12 1/2%, and NIOC 50%); and the Iranian Marine International Co. (IMINOCO) (Phillips Petroleum, AGIP Oil, and Natural Gas Commission of India, each with 16 2/3% and NIOC 50%). NIOC-OSCO's 1973 production and sales agreement was to expire in December 1978, and at yearend, all negotiations to renew it came to a halt.

In September 1979, a purge of managing officials in NIOC lead to a shift to hard line policy, not only affecting OSCO negotiations, but also changes in production and pricing policy. Influential religious leaders were calling for reduced output and an end to price restraint. The newly appointed NIOC chairman announced that Iran would no longer work through OSCO and that Iran would probably nationalize the joint ventures.

Iran's crude oil reserves were estimated at 350 billion barrels with 330 billion barrels located in the southern Khuzestan area. With a recovery factor of about 18%, this translates into proven reserves of about 65 billion barrels. An additional 20 billion barrels were expected to be recovered by the secondary recovery, gas-injection program. NIOC budgeted $2 billion for oil exploration and development for the year March 1978 to March 1979. Most of this was to be spent on gas injection for pressure maintenance in the Khuzestan oilfields. Water injection was planned for a number of offshore fields, including Darious, Kharg, Raksh, and Rostam while Sassan was to be provided with both water and gas injection facilities.

The NIOC service contractor, Sofiran (Enterprise de Recherches et d'Activities Petroliers (ERAP) 40%, Mitsubishi Oil Development Co. 40%, and Societe Nationale de Petroles d'Aquitaine 20%), began production from the offshore Sirri "C" and Sirri "D" fields during the second week of June 1978. Initial production rate was about 3,000 barrels per day, but by August 1978 had reached 18,000 barrels per day. Production had been expected to be 80,000 barrels per day by 1980 before the changes in direction were announced by the new Iranian regime. It also had been planned that when production from "C" and "D" began to decline, another small field, the Sirri "E" was to be developed. Three 1-million-barrel tanks were constructed on Sirri Island. Crude oil from these fields was 30% API with a very low sulfur content.

Refining.—The new refinery at Tabriz, with estimated capacity of 80,000 barrels per day, was inaugurated in June 1978. The Italian Co., Snam Progetti S.p.A., was responsible for the design, engineering, and construction of the project for NIOC. The Isfahan refinery, consisting of two 100,000-barrel-per-day units was 95% complete. Fluor Corp., of the United States, in a joint venture with Thyssen Rheinstahl Technic Gmbh of the Federal Republic of Germany, was constructing the plant, which was halted during the revolution. Although work was restarted in late 1979, the refinery was not to be completed until the middle of 1980. Talks continued during 1978 with the Japanese for a new 250,000-barrel-per-day export refinery at Bushehr. Under discussion since 1973, the project was running into obstacles as the Japanese Government wanted both the capacity (revised from 500,000 tons) and completion date adjusted, NIOC also planned to take interest in a 60,000-barrel-per-day refinery to be built in Korea and a 25,000 barrel-per-day refinery in Senegal. Iran also participated in refineries at Madras, India (13%), and Sasolburg in South Africa (17 1/2%).

With installation of a new unit in February 1978, the Abadan refinery was increased to a 640,000-barrel-per-day capacity. Normally an export-oriented refinery, the Abadan refinery was the only plant in operation in early 1979, when disturbances and labor strikes had paralyzed the industry. Fuel shortages became acute in early 1979 with refining and distribution of petroleum products disrupted. With normal reserves exhausted, the entire production of the Abadan refinery was diverted to domestic markets. The product tanks at Abadan were full of unneeded and unwanted fuel oil. The crude oil tanks at Kharg Island were filled with fuel oil as a stop-gap measure. Fewer than 300 workers were operating the Abadan refinery at the peak disturbances in late 1978 and early 1979, when about 2,000 were supposed to work each shift under normal conditions. The Tehran (Rey) Refinery, the second largest in Iran, was completely shut down for several weeks in June 1979, because of technical problems. By September 1979, Iran's five operational refineries had a crude throughput in percent of capacity as follows: Abadan 95%, Tehran 95%, Tabriz 75%; Shiraz 90%, and Kermanshah 60%. Iran's actual average daily refinery throughput was estimated at just over 700,000 barrels per day.

Uranium.—Exploration for uranium deposits in Iran made considerable progress during 1978, although actual mining operations had not yet begun. Mines were to be developed near Kalardasht on the northern slopes of the Elborz Mountains in Mazandaran and at Sarkahnlu in the east, where 5 grams uranium per ton occurred in graphitic ore.

The Mineral Industry of Iraq

By David E. Morse[1]

The production and export of crude petroleum continued to be the most important mineral and economic activity in Iraq during 1978 and 1979. Output of crude oil increased sharply in 1979, and Iraq moved up from third place in 1978 to the second largest Middle-East petroleum exporter in 1979. Important contracts were signed in 1978 and 1979 to make use of a significant portion of associated natural gas output that had been flared and to extract liquids and sulfur prior to distributing natural gas to new industrial facilities.

Iraq's cement and nitrogenous fertilizer industries underwent a multiple increase in capacity and output. New petroleum refineries were completed and were under construction in 1979. Iraq's first major iron- and steel-making complex began operations. A large-scale phosphate mine and fertilizer complex was under construction in northern Iraq. New salt-producing facilities and a $1 billion petrochemical complex were being built in the south. Iraq was an important producer and exporter of elemental sulfur in 1978 and 1979. A variety of crude construction materials, gypsum, and lime were produced for the domestic market.

Iraq was an active member of both the Organization of Arab Petroleum Exporting Countries (OAPEC) and the Organization of Petroleum Exporting Countries (OPEC). Iraq and other members of OPEC instituted a succession of price increases for crude oil in 1979 after maintaining a nearly constant product in 1978. Owing to its large 1979 increase in output, Iraq was able to sell significant volumes of crude oil on the spot market at a price well above that received from contractual customers. In 1979, Iraq also reduced liftings of many traditional customers when contracts were renewed and increased sales on a government-to-government basis, especially with developing nations.

The Government continued its policy of strict state control over the nation's economy. The economy was in a state of rapid expansion; buoyed by oil revenues of $10.9 billion[2] in 1978 and an estimated $20 billion in 1979, the gross national product (GNP) grew at an impressive rate of 22% in 1978 and 35% in 1979. The 1976-80 5-year development plan was developed to provide a balanced economy based on the oil, industrial, and agricultural sectors; however, overall economic development has been hampered by a shortage of skilled workers and managers in addition to an inadequate infrastructure.

Iraq planned to increase the supply of skilled workers without requiring foreign labor by a major expansion of vocational, technical, and university training programs. A compulsory education program for both sexes was instituted in the 1978-79 academic year, which had as its major goal the eradication of illiteracy.

Important investments were made to develop the nation's highway system, ports, railways, and airports. Major projects were nearing completion to expand electricity generating capacity from the 950 megawatts of 1977 to over 4,000 megawatts. The high-voltage electric distribution grid was being expanded, and electrification of rural villages was being implemented. Iraq's long-term goal of self-sufficiency in food production was to be accomplished by the construction of large-scale irrigation projects and attendent hydroelectric flood control dams on the nation's major rivers. The long period of time required for these projects to be completed meant that agricultural output will not be effected for many years and, in the interim, the agricultural growth target of 7% per year was to come from increased mechanization on land presently under cultivation and by substantial increase in livestock, poultry, and egg output.

PRODUCTION AND TRADE

Iraqi mineral output, especially in the hydrocarbon sector, increased markedly in both 1978 and 1979. New plants were responsible for the significant increase in cement and fertilizer output. New facilities for raw steel and sponge iron production were commissioned.

Crude petroleum exports continued as the nation's most important foreign exchange earner in 1978 and 1979 and represented more than 98% of the value of all exports. Sulfur, cement, and chemical fertilizers were other major mineral industry exports. Detailed information on Iraq imports and exports has not been available since 1976. Crude petroleum and sulfur export statistics were not reported by the Iraq Statistical Organization in the 1975 and 1976 Iraqi Foreign Trade Statistics.

Table 1.—Iraq: Production of mineral commodities

Commodity[1] and unit of measure	1976	1977	1978[p]	1979[e]
Cement, hydraulic ------------ thousand metric tons--	2,728	3,170	4,600	5,100
Gas, natural:				
Gross ---------------- million cubic feet--	380,000	[e] [2]370,802	[e] [2]388,460	560,000
Marketed[3] ---------------- do----	74,408	56,502	100,000	140,000
Gypsum[e] ---------------- thousand metric tons--	160	160	160	163
Iron and steel: Crude steel------------ metric tons--	--	--	50,000	150,000
Natural gas liquids:				
Natural gasoline -------- thousand 42-gallon barrels--	[e]960	1,200	[e]1,250	1,250
Propane and butane ---------------- do----	[e]1,700	2,500	[e]3,000	3,000
Nitrogen: N content of ammonia---- thousand metric tons--	[e]135	136	181	450
Petroleum:				
Crude ------------- thousand 42-gallon barrels--	881,621	857,093	935,130	1,250,000
Refinery products:				
Gasoline---------------------- do----	5,549	8,103	12,254	13,000
Jet fuel ---------------------- do----	1,341	4,708	1,935	2,000
Kerosine ---------------------- do----	3,490		5,160	5,800
Distillate fuel oil------------------ do----	8,432	8,541	12,899	12,900
Residual fuel oil ------------------ do----	8,568	9,417	14,189	15,000
Lubricants ---------------------- do----	372	390	580	600
Other ---------------------- do----	7,360	9,344	13,609	14,200
Refinery fuel and losses ------------ do----	2,130	8,444	3,870	4,000
Total ---------------------- do----	37,242	48,947	64,496	67,500
Salt -------------------- thousand metric tons--	[e]64	82	82	90
Sulfur, elemental:				
Native, Frasch-------------------- do----	582	620	600	660
Byproduct[e]---------------------- do----	40	40	40	40
Total -------------------------- do----	622	660	640	700

[e]Estimate. [p]Preliminary.
[1]In addition to the commodities listed, lime and a variety of crude construction materials (clays, stone, and sand and gravel) are also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.
[2]Reported as estimate.
[3]Includes reinjected, if any.

COMMODITY REVIEW

METALS

Iron and Steel.—Testing of new steelmaking facilities at Khor al Zubair began in two of four 70-ton arc furnaces in March 1978. The new steelworks, rated at 400,000 tons per year, had two six-strand continuous billet casters, and two rolling mills for the production of wire rods, rounds and sections. Initially domestic scrap was used for feed.

Creusot-Loire of France was concluding the construction of two HyL direct-reduction modules adjacent to the steel mill that were designed to produce 440,000 and 750,000 tons per year of sponge iron. Iron ore was imported and natural gas for the South Rumaila oilfield was used as a reductant. When in full production, sponge iron above the steel mill's need was to be exported. Iraqi steel imports in both 1978 and 1979 were estimated at 800,000 tons of milled steel products (for example, rod, bar, angles, and shapes) and 250,000 tons of pipes. Iraq operated a 30,000-ton-per-year pipemaking facility at Umm Qasr that utilized imported steel.

NONMETALS

Cement.—The Iraqi cement industry grew significantly in output and capacity in 1978 and 1979. The most notable addition was a four-kiln, 2-million-ton-per-year complex at al Kufah that was commissioned in 1978. Two 1,500-ton-per-day dry-process units were added to the Badosh cement works near Mosul. Additionally, in June 1978, a 100,000-ton-per-year white cement plant was commissioned at Falluja. Iraq's cement capacity has increased from approximately 3 million tons per year in 1976 to over 7 million tons per year in 1979.

Fertilizer Materials.—*Nitrogenous.*—In October 1979, Mitsubishi Heavy Industries of Japan completed a 2,000-ton-per-day ammonia, 3,200-ton-per-day Urea fertilizer complex at Khor al Zubair in southern Iraq near Umm Qasr. The complex trebled the nation's existing capacity. The complex consisted of two 1,000-ton-per-day Haldor Topse process ammonia units and two 1,600-ton-per-day Snamprogetti urea process plants. Natural gas from the south Rumaila/Zubair oilfields was used as feed stock for the new complex.

Phosphorous.—Syndicate Belge d'Enterprises a l'Etrange (Sybetra) of Belgium experienced significant delays in the building of a new phosphate mine and fertilizer complex in northern Iraq. All phases of a 3.4-million-ton-per-year open-cast mining operation and a 1-million-ton-per-year fertilizer complex were scheduled to be in operation late in 1980, but because of the lack of transport facilities and other factors, Iraq will not be a phosphate producer until late 1982 or early 1983.

Salt.—Early in 1978 the Government awarded a $46 million contract to Ingeco Laing International of Switzerland for the construction of a salt production complex near Fao in southern Iraq. Under a separate $20 million, 1978 contract, Wakachiku Construction Co. of Japan was to build the evaporation ponds, sea water channels, and access roads. The project, supplied on a turnkey basis, was slated for completion in 1981 and was to produce 525,000 tons per year of industrial salt and 75,000 tons per year of packaged table salt. All of the output from the project was to be consumed by the domestic market.

MINERAL FUELS

Natural Gas.—Iraq continued to flare more than 75% of the natural gas that it produced in association with crude petroleum in 1978 and 1979. Natural gas was utilized to power pumping stations on crude oil pipelines, in the production of fertilizers, in thermal power stations, and by some cement plants. Following the recommendations of studies commissiond in 1976, Iraq in 1978 and 1979 awarded contracts for large-scale gas-gathering and liquids-producing systems in both the northern and southern oilfield regions.

The northern project, based on associated gas from the Kirkuk, Bay Hasan, and Jambur oilfields, was to provide the domestic market with 1.2 million tons per year of condensate based on a natural gas throughput of 540 million cubic feet per day. Dry gas was to be utilized by major population centers in nothern Iraq including Baghdad. The project included 700 kilometers of pipelines, eight compressor stations, a processing plant at Kirkuk, storage tanks for liquids, and ancilliary faclities. The processing plant was also to recover 420,000 tons of sulfur annually. The northern project was slated to be completed in 1983.

The southern project will handle nearly 1.6 billion cubic feet per day from the Rumaila/Zubair oilfields which will release 6 million tons per year of liquids for fractionation. The southern project processing complex was to be at Khor al Zubair where export facilities, capable of handling vessels of up to 60,000 deadweight tons, were under construction. The project envisions the export of nearly 3.6 million tons per year of propane and butane. Ethane will be supplied to the Basrah petrochemical complex, natural gasoline will be recovered for local use, and the dry gas will be utilized by fertilizer plants, thermal power stations, and the new steel mill.

Petroleum.—Iraqi crude oil production increased significantly in 1978 and 1979 as expansion and development projects reached maturity. Crude oil output, which averaged 2.4 million in barrels per day in the first half of 1978, rose to 2.8 million in the second half of 1978 with production in December 1978 averaging over 3 million barrels per day; by April 1979 production was averaging nearly 3.4 million barrels per day, and by late 1979, daily production frequently topped 3.7 million barrels with a single day hitting the 4-million mark. Total Iraqi production of crude oil in 1979 breached the billion-barrel mark for the first time in 1979.

Oilfield developments expanded the Kirkuk oilfield capacity to 1.5 million barrels per day, the Bay Hasan and Jambur oilfields from 70,000 to 300,000 barrels per day, the Buzurgan—Abu Ghuraib—Jebal Fowgi group of fields to 200,000 barrels per day, and the Rumaila north oilfield to 860,000 barrels per day. The 50,600-barrel-per-day Luhais oilfield development program was completed in 1978. In 1979, Iraq announced plans to develop the Majnun oilfield, which was discovered in 1976 by Petrobras Internacional S/A (Braspetro). Production from the Majnun oilfield was to begin in 1983 with an initial rate of 350,000 barrels per day and subsequently be increased to 700,000 barrels per day. Majnun reserves have been estimated at 7 billion barrels, significantly higher than Braspetro's initial estimate of 1 to 2 billion barrels reported in 1976. Information concerning new oil discoveries in Iraq since 1975 has been scant in substantive content. The Government has on several occasions reported new important finds, but has not reported locations or estimates on the magnitude of the discoveries. Iraq reports crude oil reserves of 75 billion barrels; industry sources report estimates ranging from 32 to 34 billion barrels.

During 1979, capacity of the Basrah oil refinery was doubled to 140,000 barrels per day. A second 10,000-barrel-per-day topping plant was completed at Baiji near the K-2 pumping station, and a similar 10,000 barrel per day topping plant at al Samawah was brought to full production.

Construction on a 70,000-barrel-per-day refining facility at Baiji got underway in 1979. Engineering services for the $400 million project were to be provided by Snamprogetti S.p.A. of Italy under an April 1978 contract, and the Czechoslavakian state agencies Technoexport and Chemoproject initiated construction under a November 1978 contract. Start up was scheduled for April 1981. In October 1979, Mitsubishi Corporation and Chiyoda Chemical Engineering and Construction Co. Ltd. of Japan won a $307 million contract to supply the Iraqi State Organization for Oil Projects plant equipment for the 150,000-barrel-per-day second phase of the Baiji oil refinery complex. Commissioning of the second phase was scheduled for March 1983. Crude oil for the new major refinery was to be supplied from the Kirkuk oilfield through a new 66-centimeter (26 inch), 87-kilometer-long pipeline. The Baiji refining complex was to be connected to the Durah refining center near Baghdad to depot facilities near Mosal by dual 20-centimeter (8 inch), 400-kilometer-long product pipelines.

The Mineral Industry of Ireland

By William F. Keyes[1]

Ireland completed a second year of impressive economic growth in 1978, but the economy weakened in 1979. Real growth in the economy was about 6% in 1978 but fell to about 3.5% in 1979, as inflation jumped from 8% to 13% annually. Unemployment declined to 7.3% late in 1979, but labor relations disturbed the otherwise fairly favorable picture. Minerals producers were among those severely affected by the labor unrest. Two lead-zinc mines were shut down by strikes in 1978 and 1979, and natural gas production was hampered by lack of labor discipline.

Ireland is a major producer of zinc and lead on the world market, and it produces and exports important amounts of barite; other mineral production is chiefly of domestic importance. A quarter of the country's electricity is generated with domestic peat, and production of natural gas started in 1978. Exploration was active during 1978-79 especially for base metals in the Central Plain. However, after the tightening of licensing regulations in 1976, along with the general lack of concrete results in exploration in recent years, a feeling of caution was developing in the industry. With most outcrops already examined, the difficulty of probing the extensive glacial drift cover of the Central Plain, consisting of peat bogs and layers of silt, till, and sand and gravel, together with the need for deep overburden sampling, was inevitably increasing costs and making prospects less bright than a few years ago.

PRODUCTION

Ireland produced 3% of the world's mine zinc in 1978 and 1979 and about 1.4% of the world's lead. It also produced close to 6% of world barite. The only other mineral mined in large quantities was peat, which was almost all consumed domestically, largely for electricity production. Cement and petroleum products were produced for the domestic market, and there was a small production of copper, and, starting in 1978, of natural gas. Production of minerals in 1977, 1978, and 1979 is given in table 1.

Table 1.—Ireland: Production of mineral commodities

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]In addition to the commodities listed, substantial quantities of stone and sand and gravel are produced by local authorities for such purposes as road maintenance, but data are not reported and available general information is inadequate to make reliable estimates of output levels.
[2]Excludes output by local authorities.
[3]Reported figure.
[4]Figures given as reported in source; includes granite, marble, silica rock, sand, calcspar, fire clay, and slate and clays for cement production.
[5]Includes production by farmers and by Bord Na Mona.
[6]Includes milled peat used in the production of peat briquets, listed separately in this table.

TRADE

Ireland's chief source of metal and mineral products is the United Kingdom; much of its exports of nonferrous metal concentrates goes to smelters on the European Continent. Minerals exports and imports are shown respectively in tables 2 and 3. U.S. minerals exports to Ireland consist largely of nonferrous metals and iron and steel semimanufactures. U.S. mineral imports from Ireland are largely nonmetallics, such as barite and manufactured industrial diamonds.

COMMODITY REVIEW

METALS

Aluminum.—Site preparation began in August 1978 for the new $500 million, 800,000-ton-per-year alumina plant on Aughinish Island, in the Shannon estuary near Foynes. By yearend 1979, cost estimates reached $700 million.

By late 1978, financing arrangements were completed by the controlling consortium, Aughinish Finance Ltd., members of which were Alcan Ireland Ltd. (40%), Anaconda Ireland Ltd. (25%), and Billiton Aluminium Ireland Ltd. (35%). Loan agreements totaled $308 million, of which $250 million was in the form of a Eurodollar loan provided by 16 international banks led by the Citicorp International Group, and $58 million was in Irish pounds contributed by a group of Irish banks led by the Bank of Ireland. United Kingdom export credits had been obtained in February 1978 totaling about $146 million.

The project on Aughinish Island was the largest and most costly ever undertaken in Ireland, and when completed in 1982 or 1983 will employ 800 persons. Unfortunately the construction work was plagued by a series of 16 work stoppages by the end of 1979. The bauxite to be processed in the plant was to come from Guinea (West Africa) and Brazil. The alumina product was to be exported to aluminum smelters in North America and the European Economic Community, of which Ireland is a member.

Iron and Steel.—Irish Steel Holdings (ISH), sole domestic producer, reached a preliminary accord in 1978 with Ste. Metallurgique de Normandie, a French producer, to exchange certain products. This would permit ISH to proceed on its modernization and expansion program at its plant near Cork without a net expansion within the European Economic Community (EEC), which would have infringed on EEC rules to limit capacity in the depressed market. Normandie agreed to close its 50,000-ton-per-year, 450-millimeter section mill and would sell on behalf of ISH 60,000 tons per year of merchant bars. ISH would in turn market 60,000 tons per year of wire rod from Normandie.

ISH's expansion plans would increase capacity to some 300,000 tons per year, twice the present level, with startup scheduled for June or July 1980; a three-strand continuous bloom caster and 90-ton arc furnace were to be purchased as part of the £40 million (about $80 million) expansion. The financing package approved by the Government for the expansion plus ancillary facilities totaled £60 million, including £17.5 million from the European Economic Community, £4 million from the Irish Development Authority, £10 million to £12 million from United Kingdom leasing facilities, equity financing of £10.5 million, and the balance from short-term loans from Irish banks.

Lead-Zinc.—Ireland's new major metal mine, Tara Mines, at Navan, suffered an estimated $12 million loss in 1978. Weak base metal prices, particularly that of zinc, affected profits in the first half, and there was a 6-week strike in the quarter. Full production at the scheduled rate of 400,000 tons of zinc concentrates and 70,000 tons of lead concentrates, from 2.3 million tons of ore, which was expected to be reached by the end of 1978, was delayed at least another 6 months. The resulting financial bind, amounting to a total indebtedness of about $170 million by mid-1979, caused Tara Mines to request rescheduling of its debt repayments to the Toronto Dominion Bank and the Export Development Corporation of Canada. Approval of the Irish Government, which owns 25% of Tara, was awaited as Tara continued to suffer a series of debilitating strikes.

The Tynagh mine in County Galway, which was operating unprofitably and was scheduled to be closed by 1980, was shut down twice during the period, also because of strikes. Employees objected to the terms of proposed severance benefits supplementing payments required by Irish law. About 350 employees were due to lose their jobs. The third active Irish lead-zinc mine, Silvermines, in County Tipperary, continued in expectation of closing in the early 1980's.

Activity continued at the two new mines slated for development near Tara Mines. A Government-sponsored study on diversion of the Blackwater River, which flows across the mining area, was completed late in 1978. Bula and Tara continued to disagree about sharing the £4 million cost of diverting the Blackwater to permit underground operations; the mines are only about a mile apart. Bula Ltd. also submitted to county authorities a new plan for surface and underground mining operations, replacing the one rejected in 1976. Some 1 million tons will be mined annually, yielding 150,000 tons of lead and zinc concentrates.

At the other property, Rennicks & Bennett, at Scallanstown, near Navan, reserves were reevaluated at 2 million tons grading 7% combined lead and zinc. Messina (Transvaal) Development Company Limited exercised its option to take a 47.5% interest in the mine. This action reduced the share of Sabina Industries Ltd. of Canada to 30.45% and that of two local companies, Glencar and Rennicks & Bennett, to 17% and 5%, respectively. Messina was still to make a feasibility study and was to assume 60% of any eventual development cost. An agreement to share the nearby Tara plant was being considered.

The Irish Government Industrial Development Authority decided to go ahead tentatively with the long-discussed zinc refinery in spite of the withdrawal of the New Jersey Zinc Company from the project in January 1978. A site at Ballylongford, County Kerry, on the south bank of the Shannon estuary, was chosen, and a search was instituted for partners to share the cost, which could reach $200 million. The proposal of the Soviet Government to build the plant was rejected, and a Government mission to Japan in September 1978 evoked a promise from Mitsui Mining and Smelting Co. Ltd. to study the plans. An electrolytic refinery was considered most likely.

NONMETALS

Barite.—Growth continued in Ireland's barite industry, already the largest in Western Europe. Milchem Inc. reopened the Lady's Well mine near Clonakilty, County Cork, in August 1979 after finishing an exploration and diamond drilling program started in 1976; a rate of 50,000 tons of barite per year was to be reached. The product will go to Milchem's grinding facilities on the U.S. gulf coast via rail to the port of Cork. The Glencarbury (Benbulbin) mine at Ballintrillick, County Sligo, was being operated by Imco. Inc. (Halliburton), and a second mine in the Benbulbin area of Sligo was also to be opened by Glencar Exploration Ltd.

Major barite production in Ireland continued to come from the Silvermines (Ballynoe) deposit of Dresser Minerals (Magcobar) in Tipperary, which has a capacity of 290,000 tons per year; and from the Tynagh lead-zinc mine in Galway, where Milchem has a flotation plant with a capacity to recover about 60,000 tons per year of barite from the tailings pond.

Nitrogen.—The 366,000-ton-per-year (nitrogen content) ammonia plant, built by Nitrigin Eireann Teoranta at Marino Point in Cork Harbor, came onstream early in 1979. A urea plant with a capacity of 142,000 tons per year (nitrogen content) followed shortly thereafter. Although domestic consumption of nitrogen in fertilizers was rising rapidly, it still was well below the plant capacity, and a substantial surplus for export was expected to be available.

MINERAL FUELS

Natural Gas.—The first flow of natural gas from the Kinsale offshore field reached the landfall at Inch Bay, southeast of Cork, in October 1978, some 6 months ahead of the original schedule. The accelerated completion was a result of finishing the two production platforms in one season, at the insistence of the Government. Officials of Marathon Petroleum Ireland Ltd., the operator, announced publicly their request for additional recompense for the costs of this acceleration. At the same time they expressed regret at the lack of discipline and excessive demands made by the labor union, the Irish Transport and General Workers Union.

Petroleum.—After a record 15 wildcat wells drilled offshore in 1978, the first significant, but still noncommercial, find was made by a group comprising Phillips (the operator), Getty, Amerada-Hess, and Century Power and Light, in the Porcupine Basin, some 110 miles west of the Shannon estuary. The find had a flow of 730 barrels per day of good-quality low-sulfur crude but was made in very deep water (1,411 feet).

British Petroleum Development Ltd. also announced, in mid-1979, that it had encountered oil flows from three separate sands on Block 26/28 offshore about 1,120 miles west of Galway, also in the Porcupine Basin. The flows were not economic and were in more than 1,200 feet of water, but a decision was to be made whether to explore further in the same area.

Three major question marks faced the Irish Government if the oil exploration attained some degree of success: One was the question of the boundaries of the national jurisdiction, since the line between Ireland and the United Kingdom continued to be in dispute; second was the possible construction of a new refinery, as the sole existing refinery provided only 40% of domestic requirements (capacity was about 56,000 barrels per day) and was over 20 years old; a third major issue would be the possible formation of a national oil company. In July 1979, the Government announced the formation of a national oil company, and early in 1980, the British Government accepted an Irish proposal for arbitration of their mutual boundaries, but progress was expected to be slow.

Uranium.—Four areas in the Republic were the principal sites of searches for uranium. In 1978, the most advanced work was that undertaken by Maugh Ltd., a subsidiary of the French Government company Minatome. Maugh received 27 uranium-only licenses for an area in the Leinster Granites of the southeast; the most significant anomaly found was at Tullow, County Carlow. In the general area Irish Base Metals Ltd. (IBM), subsidiary of Northgate Exploration of Canada, focused on a site near Thomaston after Hunting Geology and Geophysics Ltd., which had the year before conducted an airborne spectrometer survey for Aquitaine Mining Ireland Ltd., completed a similar survey for IBM and its partner, Tara Prospecting Ltd. Munster Base Metals, a wholly owned subsidiary of Anglo United Development Corp., a Canadian company, held licenses in the Fintown area of County Donegal, where a significant radiometric anomaly was located; trenching and a bedrock channel sampling program were underway, and drilling started in 1979 with six shallow holes; results ranged from 0.32 pound per short ton over 11 feet to 112.2 pounds per short ton over 24.9 feet. Another Canadian company, Argosy Mining Corporation of Toronto, carried out geochemical and scintillometer surveys at Allihies, in the far southwest of County Kerry. Maugh, Irish Base Metals, and also the Geological Survey of Ireland received grants from the EEC under the EEC's Euratom program.

In mid-1978, the Government issued a Green Paper in which it saw little alternative to building at least one nuclear reactor. In view of expected major growth in energy use (estimated at 7% for several years and 5% thereafter), dependence on imported oil could become dangerous, and one 300-megawatt power station was being planned, to use coal but with provision to convert to oil if the search for offshore oil should be successful. The 650-megawatt nuclear reactor planned for Carnsore Point for 1987-88 was also a necessity because it would permit stockpiling several years' supply of fuel. Several protests were organized against building the Carnsore Point plant, particularly after reports were received of the Three Mile Island failure in the United States.

The Mineral Industry of Israel

By David E. Morse[1]

Israel's mineral industry continued to provide a small but important contribution to the nation's economy in 1978 and 1979. Water from the Dead Sea was processed to produce potash, elemental bromine, magnesium oxide, and salts of sodium and magnesium. Israel's mines and quarries produced phosphate rock, dolomite, limestone, marble, gypsum, clays, glass sand, dimension and crushed stone, and sand and gravel. Israel had three cement plants, two oil refineries, and an active chemical industry based on raw materials produced from domestic sources. Oil exploration remained active, and crude output increased substantially as the Alma field in the Gulf of Suez began production in April 1978. Israel's diamond-polishing industry continued to be significant in the world market, with net sales over $1 billion in 1978 and 1979.

The Israeli economy resumed significant growth in 1978. After 3 years of relative economic stagnation, the gross national product (GNP) increased by over 5% in real terms in both 1978 and 1979. The unemployment rate dropped from 3.9% in 1977 to 3.2% in 1979, and a significant number of workers from the West Bank were enrolled into the Israeli work force. Worker productivity, which had shown little change in the 1974-77 period, rose by an impressive 6% in 1979. The number of employed persons reached an alltime high of over 1.28 million by yearend 1979. These economic gains were accompanied, however, by a continuing high inflation rate; the consumer price index escalated by more than 50% in 1978 and by nearly 100% in 1979.

In March 1979, after holding lengthy negotiations and receiving aid in the form of incentives from the United States, Israel and Egypt signed a peace treaty. The United States agreed to aid in building facilities in Israel for the redeployment of Israeli forces from the Sinai Peninsula. In 1979, several areas of the Sinai were returned to Egyptian control, including the Alma oilfield, which was renamed Shab Ali.

Expansion of the phosphate terminal at Ashdod was completed in late 1979, bringing the handling capacity of the port to 4 million tons per year. The Israeli rail system was being expanded, and main lines to connect the present system to Sdom on the Dead Sea and to the port of Eilat on the Gulf of Agaba were slated for completion in 1983.

Israeli scientists at Technion Institute at Haifa conducted laser beam experiments designed to extract liquid and gaseous hydrocarbons from Israel's oil shales. Oil shale resources in the Negev Desert south of Arad have been estimated at 2 billion tons. Israel also continued experiments to find ways to expand the use of solar energy.

PRODUCTION

Israel's mineral sector supplied most of the domestic needs for industrial minerals and fertilizers but did not meet domestic requirements for metals and fuels. Products from the Dead Sea and phosphate rock were important export commodities. Phosphate rock, bromine, and bromine compounds showed significant production increases in 1978 and 1979 as new facilities were brought to full production. Production of most mineral commodities remained quite stable at or near the capacity of existing facilities.

[1]In addition to the commodities listed, Israel reportedly has the capacity to produce 71 tons of U_3O_8 per year, but official data are not reported and available information is inadequate to make reliable estimates of output levels.

[2]Reported figure.

TRADE

The value of Israel's mineral exports grew significantly in 1978 and 1979. Major mineral exports included phosphate rock, potash, bromine, bromine compounds, calcined and sintered magnesia, and manufactured fertilizers. Mineral industry exports, excluding petroleum and petroleum products, were valued at over $150 million[2] in 1979.

The Israeli diamond industry continued to be a significant factor in the value of Israel's total trade. Exports of polished diamond totaled $1.3 billion in 1978 and were estimated at $1 billion in 1979. Imports of rough stones were valued at $1.03 billion in 1978 and were estimated at $850 million in 1979. Major importers of polished diamond from Israel were the United States, Hong Kong, Japan, Belgium-Luxembourg, the Netherlands, Switzerland, and the Federal Republic of Germany.

Israel's materials trade balance continued to be highly unfavorable despite a 25% increase in the value of exports in 1978 and an increase of nearly 16% in 1979. Excluding defense imports, increased imports of consumer goods and the significant increase in the cost of crude petroleum on the world market contributed significantly to the trade deficit of nearly $2.45 billion in 1979. The cost of imported fuels and lubricants increased slightly (3%) in 1978 to $775 million but changed dramatically in 1979 as Israel was forced to buy more crude oil on the spot market. Petroleum imports in 1979 were over $1.2 billion.

[1]Figures may be incomplete; unless otherwise specified, the figures given are the sums of listed detail for all countries for which a quantity figure is provided in official Israeli trade returns. Additional quantities may have been exported to other countries for which only a value figure is provided. In some cases, where it is clear that a significant portion was exported for which no quantity figure was provided, the value figure has been given in a footnote.

[2]Totals exclude quantities valued at $632,000 in 1977 and $1,572,000 in 1978.

[3]Totals exclude quantities valued at $37,000 in 1977 and $3,000 in 1978.

[4]Totals exclude quantities valued at $85,000 in 1977 and $91,000 in 1978.

[5]Totals exclude quantities valued at $351,000 in 1977 and $448,000 in 1978.

[6]Total excludes quantity valued at $29,000.

[7]Totals exclude quantities valued at $16,000 in 1977 and $24,000 in 1978.

[8]Table 3 provides additional detail on these categories.

[9]Elemental bromine is included with chlorine, fluorine, and iodine in the source and is reported in this grouping under "Other" nonmetals in this table.

[10]Totals exclude quantities valued at $87,000 in 1977 and $114,000 in 1978.

[11]Totals exclude quantities valued at $68,000 in 1977 and $5,000 in 1978.

[12]Totals exclude quantities valued at $490,000 in 1977 and $408,000 in 1978.

[13]Totals exclude quantities valued at $13,000 in 1977 and $237,000 in 1978.

[14]Totals exclude quantities valued at $231,000 in 1977 and $2,169,000 in 1978.

[15]Totals exclude quantities valued at $1,184,000 in 1977 and $540,000 in 1978.

[16]Totals exclude quantities valued at $429,000 in 1977 and $4,010,000 in 1978.

[17]Total excludes quantity valued at $272,000.

[18]Total excludes quantity valued at $42,000.

[19]Totals exclude quantities valued at $98,000 in 1977 and $8,000 in 1978.

[20]Totals exclude quantities valued at $887,000 in 1977 and $291,000 in 1978.

COMMODITY REVIEW

METALS

Copper.—The Government-controlled company Israel Chemicals Ltd. was considering reopening the Timna copper mine, owing to the increased world copper price in 1979. The Timna operation was suspended in March 1976 because it was not viable at the then current price of copper.

Magnesium Compounds.—Dead Sea Periclase Ltd. (DSP) continued to make improvements in its facility near Arad. By the end of 1979, the capacity of the facility was 50,000 tons per year of sintered and calcined magnesium oxide. Production was 34,000 tons in 1978 and nearly 45,000 tons in 1979. The company also produced byproduct hydrochloric acid, which was used by Israel's domestic chemical industry. Most of DSP's magnesium oxide output was exported to western Europe for use in making refractories.

NONMETALS

Bromine.—Investments by Dead Sea Bromine Ltd. (DSB), which included modernization of production facilities and construction of a 100-ton-per-day chlorine gas plant, have resulted in an expansion of DSB's capacity to 60,000 tons per year of elemental bromine. Bromine Compounds Ltd., DSB's sister corporation, completed new facilities near Beersheba that brought its capacity to 60,000 tons per year of bromine compounds.

Fertilizer Materials.—*Phosphorous.*—Israeli production of phosphate rock increased in 1978 and 1979 as the Nahal Zin Mine (which opened in 1977) expanded to capacity. Israel's output of salable product increased from 1.72 million tons in 1978 to over 2.1 million tons in 1979. Domestic market absorbed approximately 300,000 tons in 1978 and 1979, and the remainder of production was available for export. Negev Phosphates Ltd., Israel's sole phosphate producer, planned to increase output to 2.5 million tons in 1980.

Rotem Fertilizer Ltd., a joint venture of Israeli and the Federal Republic of Germany, began building a new fertilizer complex on the Rotem Plain near Arad in 1978. The facility, to be constructed by Israeli engineers at a cost of $50 million, was planned to have a 500,000-ton-per-year sulfuric acid plant and a 120,000-ton-per-year phosphoric acid capacity. Plans were for phosphate rock from the nearby Mishor Rotem Mine to be used as feedstock for the phosphoric acid plant. The plant was scheduled to come online in 1981. The company planned to add facilities for the manufacture of triplesuperphosphate and complex fertilizer, and also for the extraction of uranium at a later date.

Haifa Chemicals Ltd. expanded its phosphoric acid capacity to 28,000 tons per year P_2O_5 and completed a 30,000-ton-per-year sodium-tripolyphosphate plant at its Haifa chemical complex in 1978. Fertilizers and Chemicals Ltd., also at Haifa, began construction of a 7,000-ton-per-year solid ammonium-polyphosphate facility that was scheduled for production in early 1980.

Potassium.—Dead Sea Works Ltd. (DSW) continued to produce near the 1.2-million-ton-per-year potash (KCL) capacity of its three plants at Sdom near the southern terminus of the Dead Sea. The company also had facilities for producing 500,000 tons per year of industrial salts and 50,000 tons per year of packaged table salt. Waste brines from the production of potash were used by DSB and DSP to produce elemental bromine and magnesium oxide. DSW announced that it had developed a new low-energy process for potash production that it claims will lower production costs by $6 per ton owing to the fuel savings. DSW planned to use the new process in two new plants that were scheduled to come online in 1982 and in 1985, with an expected increase in the company's production capacity to 2.1 million tons per year of KCL. DSW was also reconditioning a potash-granulation facility in 1979 and building new canals to extend and upgrade its evaporation pans.

MINERAL FUELS

Coal.—The Israeli Electric Corp. Ltd. was constructing a new coal-fired central power complex in 1978 and 1979 at Hadera. Plans were for the complex to have four 350-megawatt coal-fired units scheduled to come into service at yearly intervals beginning in 1980. It was estimated that 3.5 million tons per year of imported coal will be required when the plant is in full operation. Tentative agreements for the purchase of coal from the United States, Australia, and the Republic of South Africa were negotiated in 1978. The National Coal Board of the United Kingdom agreed to supply 250,000 tons per year of steam coal to Israel beginning in 1980.

Petroleum.—Israel began production of crude oil from the Alma field in the Gulf of Suez in April 1978 and was producing nearly 40,000 barrels per day when the field was released to Egypt in October 1979. Crude oil production from the Heletz field near Ashquelon continued to decline and averaged only 415 barrels per day in 1979. The Ashdod-5 well near the Mediterranean coast discovered a small field, and production began at 60 barrels per day in mid-1979. Israel continued to rely on imports to supply most of its 165,000-barrel-per-day requirements of crude oil and petroleum products. Oil Refineries Ltd. operated Israel's two oil refineries, a 66,000-barrel-per-day unit at Ashdod and a 135,000-barrel-per-day complex at Haifa.

---

[1]Physical scientist, Branch of Foreign Data.

[2]Owing to fluctuations of the Israeli pound (I£), a meaningful conversion rate for 1979 is not possible. The average rate for 1978 was I£17.471=US$1.00. The exchange rate on Dec. 30, 1979, was I£35.44=US$1.00.

The Mineral Industry of Italy

By Roman V. Sondermayer[1]

Domestic and international economic problems affected the mineral industry of Italy during 1978 and 1979. The mining and metallurgical industry's economic growth continued to lag behind general economic trends, mostly owing to lack of significant improvement in the structure of the industry and to sluggish demand. High labor and other costs reduced profit margins, resulting in low investment in the mineral sector and significant financial losses in major Government-owned companies. Employment in mining was approximately 20,000 persons.

After the Ente Nazionale Gestione Aziende Minerarie e Metallurgiche (EGAM) was abolished in 1977, work on reorganization continued until the fall of 1978 when Ente Nazionale Idrocarburi (ENI), the state-controlled hydrocarbon agency, announced formation of an operating subsidiary to consolidate the mining, metallurgical, and industrial activities it had received from EGAM under the provisions of Law No. 26 of June 6, 1977.

The new company, Societá per Azioni Minero-Metallurgiche (SAMIM), was to comprise four directorates and five operational divisions as follows: Directorate for Planning, Directorate for Finance and Control, Directorate for Personnel and Organization, Directorate for Trade, Mining Division, Metallurgical Division, Division for Basic Minerals Research, Division for Development and New Initiatives, and the Division for Associated Companies.[2] Parliament has allocated 2,000 billion lire for this reorganization. The main aim was to save about 33,000 jobs which would be lost if EGAM's activities were halted.

During 1978 and 1979, major events in the mineral industry included the organization of SAMIM, planning for doubling capacity at the alumina plant at Porto Scuso in Sardinia, closing of two lead and zinc mines in Sardinia, expansion of the zinc smelter at Porto Vesme in Sardinia, beginning of development of a fluorspar mine and start of construction of the related mill near Rome, and agreement to construct a gas pipeline under the sea between Algeria and Italy.

PRODUCTION

The mineral industry obtained mixed results, as shown in table 1. The mining and processing sectors were owned by public and private enterprises, but the Government's ENI, with its affiliates SAMIM, AGIP, and SNAM, Italsider in steel, and Government-owned potash mines, controlled most of the sector. Societa Mineraria e Metallurgica di Pertusola, S.A. (Pertusola) in lead-zinc, Falck Acciaierie Ferriere Lombarde (Falck) in steel, and major foreign oil and gas companies were the chief prominent privately owned companies of the sector.

Total do	832,987	856,180	865,306	885,393

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]Reported figure.
[2]Excludes pelletized iron oxide derived from pyrite.
[3]Less than 1/2 unit.

TRADE

Italy was dependent on imports of large quantities of raw material for production of metals and fuels. Details on foreign trade are shown in tables 2 and 3. The United States had a negative mineral trade balance with Italy.

Table 2.—Italy: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite	6,744	12,240	Greece 5,110; Federal Republic of Germany 2,515; France 2,427.
Oxide and hydroxide	332,277	327,599	Netherlands 110,101; Norway 104,232; U.S.S.R. 43,292.
Ash and residue containing aluminum	3,939	6,609	Federal Republic of Germany 3,273; France 2,927.
Metal including alloys:			
Scrap	522	1,023	Federal Republic of Germany 770.
Unwrought	24,367	69,933	Federal Republic of Germany 24,212; China, mainland, 9,500.
Semimanufactures	90,366	108,802	Federal Republic of Germany 22,872; France 19,425; United States 10,604.
Antimony:			
Ore and concentrate	--	36	All to United States.
Metal including alloys, all forms	1,145	61	Federal Republic of Germany 30; Netherlands 20.
Arsenic:			
Trioxide, pentoxide, acids	238	NA	
Arsenic and tellurium, elemental	69	([1])	NA.
Bismuth metal including alloys, all forms	31	30	NA.
Cadmium metal including alloys, all forms	140	124	Belgium-Luxembourg 42; Netherlands 40; Federal Republic of Germany 38.
Chromium:			
Chromite	2,137	3,606	Romania 1,810.
Oxide and hydroxide	1,037	1,835	France 1,222; Switzerland 95; Taiwan 53; United Kingdom 40.
Metal including alloys, all forms	10	39	NA.
Cobalt:			
Oxide and hydroxide	([1])	10	NA.
Metal including alloys, all forms	29	97	Federal Republic of Germany 41; United Kingdom 15; Netherlands 5.
Columbium and tantalum metals, all forms, including waste and scrap	3	17	NA.
Copper:			
Ore and concentrate	1,604	2,595	Spain 1,440; Bulgaria 650.
Ash and residue containing copper	9,895	13,525	Federal Republic of Germany 8,532; Austria 3,737; German Democratic Republic 550.
Copper sulfate	3,108	2,597	France 954; Greece 600; Federal Republic of Germany 389.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

METALS —Continued			
Copper —Continued			
Cement copper	378	45	Netherlands 22.
Metal including alloys:			
Scrap	11,029	9,088	Federal Republic of Germany 7,373; France 341.
Unwrought:			
Blister	2,131	877	Federal Republic of Germany 344; France 331; Austria 137.
Refined, unalloyed	790	751	Federal Republic of Germany 561; Switzerland 153.
Alloys	1,817	1,574	Federal Republic of Germany 481; France 271; Austria 226.
Semimanufactures	59,720	94,100	France 20,683; Federal Republic of Germany 18,033; Yugoslavia 9,771.
Gallium, indium, thallium kilograms	--	100	NA.
Germanium metal including alloys, all forms	17	8	NA.
Iron and steel:			
Ore and concentrate, except roasted pyrite	3,225	10,703	NA.
Roasted pyrite thousand tons	128	67	France 52.
Metal:			
Scrap do	11	7	Federal Republic of Germany 3; France 2.
Pig iron, cast iron, spiegeleisen, powder, shot do	9	17	Federal Republic of Germany 5; France 1; United Kingdom 1.
Ferroalloys do	23	32	Federal Republic of Germany 7; France 6; Belgium-Luxembourg 4.
Steel, primary forms do	923	995	United States 220; France 127; Greece 122.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	2,542	3,753	Federal Republic of Germany 1,030; France 555; Libya 118.
Universals, plates, sheets do	1,306	1,433	United States 306; France 224; Federal Republic of Germany 155.
Hoop and strip do	75	126	Greece 23; France 21; U.S.S.R. 13; Bulgaria 7.
Rails and accessories do	41	23	Poland 8; Switzerland 4; Netherlands 3; United States 2.
Wire do	64	81	France 19; Federal Republic of Germany 12; Algeria 8.
Tubes, pipes, fittings do	1,752	1,831	U.S.S.R. 499; Mexico 229; Federal Republic of Germany 196.
Castings and forgings, rough do	8	5	France 2; Libya 2; Federal Republic of Germany 1.
Total do	5,788	7,252	
Lead:			
Ore and concentrate	26,980	19,207	Greece 11,400; Austria 4,282; U.S.S.R. 3,500.
Ash and residue containing lead	19,077	7,920	France 7,757.
Oxide	535	1,936	Austria 770; Hungary 292; Czechoslovakia 240.
Metal including alloys:			
Scrap	23	95	NA.
Unwrought	4,123	8,312	Federal Republic of Germany 3,296; Romania 2,000; Egypt 921.
Semimanufactures	644	653	Saudi Arabia 345; Libya 145.
Magnesium metal including alloys:			
Scrap	1,006	638	United States 323; France 128.
Unwrought	4,208	4,795	Federal Republic of Germany 4,310; Belgium-Luxembourg 325.
Semimanufactures	12	290	France 164; Nigeria 27; Norway 13.
Manganese:			
Ore and concentrate	37	30	NA.
Oxide and hydroxide	19	4	NA.
Metal, all forms	20	18	NA.
Mercury 76-pound flasks	10,301	22,394	United States 5,129; France 4,096; India 3,562.
Molybdenum:			
Ore and concentrate	459	269	Austria 155; Netherlands 79; Federal Republic of Germany 24.
Metal including alloys, all forms	32	20	NA.

See footnotes at end of table.

Dimension stone —Continued			
Worked:			
Slate	33,794	35,154	United States 20,015; Austria 2,948; Canada 1,998.
Paving stone and flagstone	53,961	95,775	Federal Republic of Germany 43,132; Switzerland 29,485; Austria 8,974.
Other	890,154	955,829	Federal Republic of Germany 379,633; Saudi Arabia 127,682; France 112,590.
Dolomite, chiefly refractory grade	29,956	29,670	Switzerland 4,372; Federal Republic of Germany 4,017; Austria 3,543.
Gravel and crushed rock	547,891	643,828	Switzerland 126,402; Federal Republic of Germany 103,814; Kuwait 54,716.
Limestone, except dimension	364	72	NA.
Quartz and quartzite:			
Piezoelectric crystal ______ kilograms	--	30	NA.
Other	45,242	37,798	Switzerland 16,787; France 12,746; Federal Republic of Germany 3,191.
Sand, excluding metal bearing	441,432	434,043	Switzerland 392,754; Libya 2,346.
Sulfur:			
Elemental, all forms	4,262	3,797	Yugoslavia 1,532; Federal Republic of Germany 1,107; France 620.
Sulfur dioxide	1,156	NA	
Sulfuric acid	93,063	81,097	Spain 26,558; Turkey 12,976; Greece 2,978.
Talc, steatite, soapstone	59,065	56,591	Federal Republic of Germany 18,351; France 9,687; United Kingdom 9,495.
Other:			
Crude:			
Meerschaum, amber, jet	37	NA	
Other	81,256	87,542	United Kingdom 60,830; Switzerland 8,124; Netherlands 2,500.
Slag, dross, and similar waste, not metal bearing	240,970	307,019	Yugoslavia 264,983; Austria 27,760.
Oxides, hydroxides, and peroxides of magnesium, strontium, barium	1,962	2,396	United States 683; United Kingdom 427; Denmark 105.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	121,791	141,317	France 47,713; Libya 22,621; Federal Republic of Germany 13,559.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	2,626	6,018	Algeria 2,816; Tanzania 1,937.
Carbon black and gas carbon	38,037	39,493	Yugoslavia 11,306; France 7,789; Austria 7,322.
Coal, all grades, including briquets	15,282	5,554	France 3,675; Argentina 848.
Coke and semicoke	593,304	625,167	United States 192,320; Algeria 122,562; Romania 114,754.
Gas, natural ________ thousand cubic feet	174	502	NA.
Peat	544	730	NA.
Petroleum refinery products:			
Gasoline _____ thousand 42-gallon barrels	55,333	66,590	Netherlands 17,002; United Kingdom 12,023; France 4,900.
Kerosine ______ do	18,941	22,310	Greece 2,724; Egypt 1,447; Libya 1,437; United Kingdom 1,254.
Distillate fuel oil ______ do	38,077	49,721	France 7,477; Netherlands 7,195; Federal Republic of Germany 4,813.
Residual fuel oil ______ do	45,888	57,550	United States 9,711; Turkey 4,647; United Kingdom 3,135.
Lubricants ______ do	2,788	3,298	Belgium-Luxembourg 414; Vietnam 289; Federal Republic of Germany 286.
Other:			
Liquefied petroleum gas ______ do	5,364	5,461	Algeria 878; Egypt 764; Morocco 700; Portugal 456.
Mineral jelly and wax ______ do	14	18	Switzerland 13.
Bitumen and other residues ______ do	1,125	1,228	Austria 527; Switzerland 221; Tunisia 147; Algeria 131.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
MINERAL FUELS AND RELATED MATERIALS —Continued			
Petroleum refinery products —Continued			
Other —Continued			
Bituminous mixtures, n.e.s thousand 42-gallon barrels	56	46	Sudan 11; Libya 6; Kuwait 5; Poland 2.
Petroleum coke and pitch do	269	275	Switzerland 145; France 47; Greece 46.
Total do	167,855	206,497	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	52,959	61,634	France 24,699; Yugoslavia 18,074; China, mainland, 1,709.

NA Not available.
[1]Less than 1/2 unit.

Table 3.—Italy: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite thousand tons	1,939	1,645	Australia 1,080; Guinea 468; Guyana 39.
Ash and residue containing aluminum	56,780	61,782	Austria 39,650; Yugoslavia 9,889; France 6,375.
Oxide and hydroxide	145,984	166,841	Guinea 107,725; France 24,270; Federal Republic of Germany 14,910.
Metal including alloys:			
Scrap	45,342	41,448	Federal Republic of Germany 11,747; France 9,076; Switzerland 8,081.
Unwrought	242,917	231,849	Federal Republic of Germany 62,855; France 38,568; Greece 26,324.
Semimanufactures	60,750	62,312	Federal Republic of Germany 25,957; France 13,166; Belgium-Luxembourg 7,007.
Antimony:			
Ore and concentrate	720	--	
Metal including alloys, all forms	121	152	Belgium-Luxembourg 81; France 26.
Arsenic:			
Trioxide, pentoxide, acids	917	NA	
Arsenic and tellurium, elemental	47	78	United States 18; United Kingdom 2.
Beryllium metal including alloys, all forms kilograms	1,837	1,700	NA.
Bismuth metal including alloys, all forms	96	61	United Kingdom 24.
Cadmium metal including alloys, all forms	148	179	Finland 100; Federal Republic of Germany 57.
Chromium:			
Chromite	187,389	140,186	Turkey 58,117; Republic of South Africa 31,755; Albania 20,943.
Oxide and hydroxide	1,684	1,357	Federal Republic of Germany 972; France 125; U.S.S.R. 100.
Metal including alloys, all forms	88	206	France 68; United Kingdom 61.
Cobalt:			
Oxide and hydroxide	254	214	Belgium-Luxembourg 172; France 41.
Metal including alloys, all forms	312	369	Belgium-Luxembourg 155; France 105; United Kingdom 28.
Columbium and tantalum metals, all forms, including waste and scrap	15	9	United States 5; Austria 1.
Copper:			
Ore and concentrate	30	16	NA.
Cement copper	704	54	All from Austria.
Copper sulfate	975	3,213	Austria 1,380; France 884; Czechoslovakia 460.
Ash and residue containing copper	334	227	NA.
Metal including alloys:			
Scrap	72,639	69,579	United Kingdom 21,220; Federal Republic of Germany 19,931; France 19,459.
Unwrought:			
Blister	5,778	4,654	Chile 3,641; Yugoslavia 449.
Refined, unalloyed	299,584	351,646	Chile 92,222; Zambia 50,576; Belgium-Luxembourg 31,332.
Alloys	16,786	14,447	Yugoslavia 3,828; Poland 2,879; United Kingdom 2,848.

See footnotes at end of table.

Table 3.—Italy: Imports of mineral commodities —Continued

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Copper —Continued			
Metal including alloys —Continued			
Semimanufactures	56,038	69,492	Federal Republic of Germany 24,261; France 14,505; Belgium-Luxembourg 6,172.
Gallium, indium, thallium kilograms	708	1,000	United Kingdom 900.
Germanium do	1,676	100	NA.
Iron and steel:			
Ore and concentrate thousand tons	14,694	16,297	Brazil 3,790; Liberia 3,318; Venezuela 1,606.
Roasted pyrite	468	173	NA.
Metal:			
Scrap thousand tons	5,868	6,566	France 2,972; Federal Republic of Germany 2,045; U.S.S.R. 159.
Pig iron, cast iron, spiegeleisen do	680	347	Federal Republic of Germany 97; Sweden 72; Brazil 56.
Sponge iron, powder, shot do	38	68	Canada 36; Venezuela 14; France 7; Sweden 7.
Ferroalloys:			
Ferromanganese do	128	106	France 52; Republic of South Africa 16; Federal Republic of Germany 14.
Other do	155	187	Republic of South Africa 34; France 28; Sweden 27.
Total do	283	293	
Steel, primary forms do	2,553	2,210	France 681; Belgium-Luxembourg 290; Federal Republic of Germany 248.
Semimanufactures:			
Bars, rods, angles, shapes, sections thousand tons	724	584	Federal Republic of Germany 253; France 204; Algeria 107.
Universals, plates, sheets do	1,675	1,255	France 445; Belgium-Luxembourg 204; Federal Republic of Germany 130.
Hoop and strip do	150	165	France 62; Federal Republic of Germany 52; Belgium-Luxembourg 18.
Rails and accessories do	63	139	Canada 44; Federal Republic of Germany 35; France 34.
Wire do	53	54	Belgium-Luxembourg 24; France 13; Federal Republic of Germany 9.
Tubes, pipes, fittings do	158	169	France 61; Federal Republic of Germany 52; Austria 5.
Castings and forgings, rough do	4	5	Federal Republic of Germany 2; France 1; Switzerland 1.
Total do	2,827	2,371	
Lead:			
Ore and concentrate	14,264	18,589	Morocco 5,829; Greece 5,664; Denmark 3,034.
Ash and residue containing lead	881	8,555	Hungary 4,732; Federal Republic of Germany 2,828.
Oxide	6,585	3,671	Netherlands 2,945; Federal Republic of Germany 305.
Metal including alloys:			
Scrap	41,124	38,275	France 19,382; Switzerland 6,437; Federal Republic of Germany 5,503.
Unwrought	163,625	138,318	Federal Republic of Germany 36,524; Republic of South Africa 19,386; Mexico 14,719.
Semimanufactures	1,216	974	NA.
Magnesium metal including alloys:			
Scrap	2,515	2,251	Federal Republic of Germany 1,275; Austria 297; Netherlands 209.
Unwrought	578	1,032	Norway 503; United States 219; France 132.
Semimanufactures	231	327	United States 192; Switzerland 42; United Kingdom 18.
Manganese:			
Ore and concentrate	269,243	284,319	Republic of South Africa 150,953; Gabon 75,434; Brazil 35,961.
Oxides	1,908	2,850	Greece 1,053; Belgium-Luxembourg 1,016.
Metal, all forms	1,145	1,165	Republic of South Africa 734; France 219.

Table 3.—Italy: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS —Continued			
Mercury 76-pound flasks	570	1,297	NA.
Molybdenum:			
Ore and concentrate	5,808	5,637	Netherlands 3,968; United States 636; Belgium-Luxembourg 382.
Metal including alloys, all forms	188	176	Austria 67; United States 53; Netherlands 15.
Nickel:			
Matte, speiss, similar materials	5,702	7,537	Canada 3,554; Cuba 2,757; Australia 569.
Metal including alloys:			
Scrap	970	299	Canada 125.
Unwrought	11,509	11,912	Republic of South Africa 2,703; United States 2,269; Netherlands 1,973.
Semimanufactures	2,256	2,313	United Kingdom 712; Federal Republic of Germany 667; France 261.
Platinum-group and silver metals including alloys:			
Platinum-group thousand troy ounces	435	455	Federal Republic of Germany 256; Republic of South Africa 95; United Kingdom 59.
Silver do	30,916	31,768	United States 9,986; Federal Republic of Germany 7,842; United Kingdom 7,321.
Rare-earth metals:			
Oxides and other compounds value, thousands	$569	$795	France $666; Austria $103.
Metals:			
Cerium	12	NA	
Other	430	122	Federal Republic of Germany 92.
Selenium, elemental	27	21	United Kingdom 9.
Silicon, elemental	4,779	5,579	Yugoslavia 2,136; France 1,697; Sweden 598.
Thorium:			
Ore and concentrate	NA	20	NA.
Thoria value	$122,969	$7,486	NA.
Tin:			
Ore and concentrate	2	--	
Oxide	18	NA	
Metal including alloys:			
Scrap	3	--	
Unwrought	6,758	6,426	Malaysia 2,530; Indonesia 2,414; Thailand 470.
Semimanufactures	298	214	Federal Republic of Germany 68; Belgium-Luxembourg 31; France 23.
Titanium:			
Ore and concentrate	141,512	126,428	Australia 84,408; Norway 41,809.
Oxides	36,693	44,716	Federal Republic of Germany 17,065; France 11,073; Belgium-Luxembourg 4,669.
Metal including alloys, all forms	1,954	2,769	Austria 888; United States 760; Federal Republic of Germany 434.
Tungsten:			
Ore and concentrate	25	126	All from Canada.
Metal including alloys, all forms	100	124	Federal Republic of Germany 25; France 23; United Kingdom 16.
Uranium metal including alloys, all forms kilograms	200	300	NA.
Vanadium:			
Ore and concentrate	924	[1]1,798	NA.
Oxide and hydroxide	375	1,009	Austria 732; Federal Republic of Germany 156; Republic of South Africa 98.
Metal including alloys, all forms	([2])	2	NA.
Zinc:			
Ore and concentrate	193,432	206,600	Ireland 51,311; Peru 39,869; France 28,030.
Matte, ash, and residue containing zinc	8,466	6,665	Federal Republic of Germany 2,650; Switzerland 2,568.
Oxide and hydroxide	2,602	2,248	France 764; Federal Republic of Germany 662; Netherlands 492.
Metal including alloys:			
Scrap	1,596	1,710	Federal Republic of Germany 538; France 405.
Blue powder	2,035	444	Norway 133; France 108; Federal Republic of Germany 47.

See footnotes at end of table.

METALS —Continued			
Zinc —Continued			
Metal including alloys —Continued			
Unwrought	66,381	54,043	Federal Republic of Germany 13,006; Belgium-Luxembourg 10,149; Netherlands 7,572.
Semimanufactures	1,970	2,038	Belgium-Luxembourg 868; France 497; Federal Republic of Germany 290.
Zirconium:			
Ore and concentrate	42,558	42,209	Australia 41,329; France 556; Republic of South Africa 149.
Metal including alloys, all forms _ kilograms	30,786	24,200	Sweden 9,400; Federal Republic of Germany 4,900; France 3,000.
Other:			
Ores and concentrates	7,704	508	NA.
Ash and residue containing nonferrous metals	6,941	15,417	Republic of South Africa 3,587; Canada 2,678; Federal Republic of Germany 1,708.
Oxides, hydroxides, peroxides of metals	6,670	7,725	Cuba 3,030; Federal Republic of Germany 1,585; Belgium-Luxembourg 343.
Metals including alloys, all forms:			
Metalloids	57	1	NA.
Alkali, alkaline-earth, rare-earth metals, n.e.s	7,055	6,573	Federal Republic of Germany 4,336; France 1,395.
Pyrophoric alloys	13	NA	
Base metals including alloys, all forms, n.e.s	60	5	NA.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	3,682	3,551	Federal Republic of Germany 1,065; Yugoslavia 460.
Dust and powder of precious and semiprecious stones _ kilograms	1,122	1,111	United States 472; Ireland 448.
Grinding and polishing wheels and stones	4,155	3,689	Austria 969; Federal Republic of Germany 521; United Kingdom 472.
Asbestos	65,468	47,189	Republic of South Africa 22,960; Canada 12,212; U.S.S.R. 7,423.
Barite and witherite	18,538	13,871	France 6,081; Spain 5,648; Federal Republic of Germany 600.
Boron materials:			
Crude and natural borates	165,578	186,803	Turkey 153,802; United States 29,230; Federal Republic of Germany 1,991.
Oxide and acid	2,039	843	United States 348.
Cement	66,426	67,729	France 52,921; Yugoslavia 8,136; Spain 4,082.
Chalk	14,983	15,235	France 14,598.
Clays and clay products:			
Crude:			
Bentonite	65,595	54,673	Greece 45,949; Belgium-Luxembourg 2,720; Spain 1,568.
Kaolin	649,279	673,576	United Kingdom 305,469; United States 152,203; Federal Republic of Germany 125,501.
Other	678,444	579,406	France 235,613; Federal Republic of Germany 190,844; United Kingdom 78,308.
Products:			
Refractory (including nonclay brick)	141,439	80,571	Federal Republic of Germany 25,766; United Kingdom 17,493; France 11,493.
Nonrefractory	18,806	20,940	Federal Republic of Germany 9,377; France 5,356; Switzerland 3,942.
Cryolite and chiolite	2,812	1,226	Denmark 1,176.
Diamond:			
Gem, not set or strung _ carats	109,014	99,360	Belgium-Luxembourg 60,361; Israel 14,805.
Industrial _ do	140,923	190,374	Belgium-Luxembourg 123,249; Netherlands 26,043; Republic of South Africa 12,199.
Diatomite and other infusorial earth	3,748	5,391	Federal Republic of Germany 2,412; France 1,498; United States 514.
Feldspar	29,737	29,143	Canada 13,387; Norway 7,087; Federal Republic of Germany 2,959.

NA Not available.
[1]Includes columbium and tantalum ores and concentrates, if any.
[2]Less than 1/2 unit.

COMMODITY REVIEW

METALS

Aluminum.—During 1978 and 1979, Italy remained a large processor of imported bauxite and a significant producer of aluminum. The management of Euroallumina was planning to double capacity of its 1-million-ton-per-year alumina plant at Porto Scuso in Sardinia. Most of the new output will be reexported. In addition, plans were made to expand the 36,000-ton-per-year aluminum plant at Fusina, near Venice, operated by Alumetal SpA. New capacity should reach 70,000 tons per year of aluminum metal.

The Government of Italy has provided some 117,000 million lire to assist the state-owned sector of the aluminum industry. The largest part will be needed by the Alsars (Aluminio Sardo SpA) plant at Porto Vesme, Sardinia, where about 40% of its losses resulted from high prices for electricity. During 1978 and 1979, six aluminum smelters were in operation in the country with an aggregate capacity of 286,000 tons per year of aluminum metal. The largest plant was the smelter at Porto Vesme (capacity, 125,000 tons per year).

Bauxite for production of alumina was all imported. The small domestic production of around 35,000 tons from Amplamento Cavone mine, Poggiardo, Palmariggi, and Otranto, all in the Puglia region, mostly was used for cement production.

Iron Ore.—Domestic output of iron ore supplied only about 2% of the country's requirements, and imports were essential to meet the demand. The Cogne mine near Aosta, operated by the Cogne Steel Plant, and facilities on the Isle of Elba (Rio Marina plant), operated by Italsider, were the principal producers of iron ore. In addition, about 360,000 tons of iron pellets (65% iron) were produced at Scarlino from pyrite cinder left after production of sulfuric acid from pyrite.

Iron and Steel.—Performance of the iron and steel industry of Italy was modest during 1978 and 1979, and the Italian steel industry's prospects remained gloomy. Lower demand, lack of capital for needed improvement, structural problems of the industry, and poor performance of state-owned companies when compared with the private sector hampered operations.

During 1978, a new steel plan was made public by the Government. The plan calls for a steel output of about 25 million tons in 1980 and 31 million tons in 1985. The plan was considered optimistic and aroused some controversy. In addition, the steel sector was identified as needing reorganization.

The new 115-ton arc furnace at Italsider's Genova-Campi Works, rated at 250,000 tons per year of steel, was near completion at yearend 1978; it will replace two 100-ton open hearths.

The Gioia Tauro integrated steel plant project, in Calabria, was abandoned. The finances saved apparently will be used for modernization of Italsider's plant near Genova.

About 48% of Italian steel was produced in electric furnaces, 45% by Linz-Donawitz (LD) converter, and the rest by open hearth. Approximate capacity utilization was 68%, and the pig iron/steel ratio was 49/100.

The Finsider holdings, through which most of the Italian Government's activities in the iron and steel sector are exercised, produced about 55% of the Italian steel output. Among these holdings, Italsider was the largest Government-owned steel producer; Acciaierie e Ferriere Lombarde Falck remained the largest privately owned steel producer in the country.

During 1978 and 1979, most steelmaking raw materials were imported. In foreign trade in steel products, Italy registered a surplus during 1979.

Lead and Zinc.—Italy remained a net importer of lead and zinc metals during 1978 and 1979. Italy's output of lead metal supplied about 20% of the country's needs, but domestic production of zinc supplied about 73% of the demand for zinc metal. Activities of the mining and metal sectors of the industry were subdued and no major events, by world standards, were recorded. At Monteponi mine in Sardinia, operated by SAMIM, exploration on level 60 North resulted in discovery of significant mineralization. Details such as grade of ore and reserves were not made public at yearend 1978. During 1979, preparation for production from this section was underway.

In the area of Genna Luas, opencast mining started. Reserves of the Meteponi mine were increased from 1.8 to 2.1 million tons. At the San Giovanni e Arenas mine operated by Piombo Zincifera Sarda SpA, opencast mining continued in the Arenas section, and exploration was underway in Pinna Perda under the mineralized zones already mined out. Mining at SAMIM's nearby Finice Capanne mine stopped at the beginning of 1979 because the deposit was exhausted. In 1978 mining operations were suspended at Buggeraeu Suzufuru, operated by Piombo Zincifera Sarda SpA, owing to charges by local authorities of excessive pollution of the sea.

The Italian Government would like to close three obsolete zinc smelters formerly belonging to EGAM (Ponte Rosa, Porto Marghera and Monteponi) and expand capacity at Porto Vesme, which was operated by Azienda Mineraria et Metalurgica Italiane Sarda SpA (Ammi Sarda SpA), to 75,000 tons per year. Final action on closing of plants was delayed because of the social and economic consequences of such a closure on the regional economy. Expansion of the Crotone zinc electrolytic plant, operated by Pertusola, continued during 1978-1979.

Pyrites.—During 1978 and 1979, development of the Campiano mine in Tuscany by Solmine SpA continued after it had been dewatered. According to reports, labor shortages at the Nicoleta and Govorano pyrite mines, also in Tuscany and operated by Solmine, caused significant losses of production.

NONMETALS

Fluorspar.—In 1978 a decision was made to start development of a mine and construction of a commercial metspar plant based on the Pianciano fluorspar deposit owned by Soricom SpA, a wholly owned subsidiary of the Australian company, Southland Mining Ltd. The deposit is located in the province of Lazio, about 34 kilometers northwest of Rome, and consists of soft pyroclastic, lacustrius, muds and sands deposited around the Sabatino volcano. Thickness of the seams varies, but the problems are minimized by flatness of the beds and ease by which the deposit can be mined by opencast mining methods. Sandy and clayey ore makeup the producing zone. The clayey ore is extremely fine grained with an average fluorspar content close to 56%. The sand ore is mostly calcite, and its fluorite content is about 21%. Reserves were assessed at 5.8 million tons of sandy ore. By blending the two ores, Soricom intended to ship to the mill ores averaging 44% of fluorite.

Pianciano ore is very fine, and special processing, based on a flow sheet prepared by the Bureau de Recherches Geologiques et Minière (BRGM), had to be developed. Economics are most favorable at production of 200,000 tons of pellets containing about 80% fluorspar. Startup for the plant was planned for 1980.

Italy was self-sufficient in fluorspar; imports and exports were of the same order of magnitude. Most fluorspar to date has been produced on the island of Sardinia and in Lombardy.

Potash.—Mining of potash in Sicily was to be concentrated in the next few years into three large units where the 150,000,000 tons of known reserves are concentrated. These are Pasquasia, east of Caltanissetta, which began production in 1964; Realmonte, a salt mine west of Porto Empedocle, which has recently been developed to produce potash from one area; and Milena, a new mine near the San Cataldo/Palo mine, on which development for a production of 500,000 tons per year of ore was to begin in 1978.

Mines and plants in operation in Sicily in 1978 and 1979 are listed in the following tabulation:

	Location	Apparent capacity, tons per year		Remarks
		Ore	K_2O	
MINE				
Pasquasia	10 kilometers east of Caltanisetta.	1,000,000	NA	
Corvillo	Villarosa, West of Enna.	200,000		Ore to Pasquasia.
San Cataldo/Palo	San Cataldo	400,000		Almost exhausted.
Racalmuto	Racalmuto	400,000		Ore to San Cataldo.
Realmonte	Realmonte, West of Porto Empedocle.	200,000		
REFINING PLANTS				
Pasquasia	At mine	NA	130,000	
Campofranco	do	1,500,000	100,000	Feed via tram from San Cataldo/ Palo, Racalmuto, and Realmonte.

NA Not available.

All Sicilian potash is kainite, which is converted to the salable product, potassium sulfate, at the two plants at Pasquasia and Campofranco. Production in 1978 and 1979 declined somewhat. All potash mines (except Realmonte, the salt and potash producer) were operated by Industria Sali Potassici el Afini (ISPEA), a company controlled by

Ente Minerario Siciliano, the Sicilian Government mining entity (60.7%); Montedison, the Italian chemical company (33.3%); and ENI, the nationalized petroleum company (6%).

Salt.—In 1978 a new salt refining plant came onstream at the Petralia Mine in Sicilia. At the port town of Empedocle, a second facility for loading salt was completed with a capacity of 100 tons per hour.

MINERAL FUELS

During 1978 and 1979, Italy remained totally dependent on imported solid liquid and gaseous hydrocarbons. Natural gas was the principal fuel produced in the country.

Coal.—Lignite was the only coal produced in Italy. Two mines, Santa Barbara and Pietrafitta, both in Perugia, were in operation. They were operated by Ente Nazionale Elettrico (ENEL), and all output was consumed in ENEL's power plants. Imports of bituminous coal, mostly for coking, were essential for operating the country's economy.

Natural Gas.—Italy was dependent on imports to supplement limited domestic production of natural gas. Italy had in force four long-term gas supply contracts at the end of 1979. The Libyan Government assures delivery of 10 million cubic meters per day of gas by tankers in the form of liquefied natural gas (LNG). The contracts with the U.S.S.R. and the Netherlands provide for deliveries of 20 million cubic meters per day through pipelines from each country. Supplies from Algeria should become significant in the future. During 1978, ENI and Sonatrach of Algeria signed a contract for construction of a 2,500-kilometer-long pipeline from the Algerian gasfields of Hass' R'mel, through Tunisia, under the Sicilian Channel, and across Sicily for connection with the domestic natural gas pipeline system. The pipeline will supply 12 billion cubic meters per year for a period of 25 years starting in 1981, at a total price of approximately $13.6 billion. The contract price is $1.28 per million BTU, very close to the current Algerian $1.30 base price for LNG contracts with other customers. The 100-mile-long segment underwater from Tunisia to Sicily, will be 16 inches in diameter, and the Italian firm, Snamprogetti, was to be the builder. Total pipeline costs were estimated at close to $3.4 billion. Construction started during 1979.

Imports will supply about 70% of Italy's domestic requirements by 1985, shown as follows:

	Quantity (billion cubic meters)	Total demand (percent)
Natural gas:		
Algeria	12.0	30.0
U.S.S.R	7.5	17.5
Netherlands	6.3	15.0
LNG: Libya	3.2	7.5
Total	29.0	70.0

Petroleum.—Exploration for hydrocarbon continued offshore and onshore and was moderately successful. Several discoveries were announced during 1978 and 1979, and these discoveries should slightly and temporarily improve the modest domestic share of Italy's energy supply. Positive results in exploration have given the proponents of domestic activities more arguments for continued drilling in the country.

A new draft bill, aimed at encouraging exploration in Italy, was pending in the Parliament at yearend. One major provision of the bill would encourage formation of joint ventures for oil exploration. The draft bill would also reduce royalties and taxes on offshore production, simplify administrative procedures for processing of exploration permits, allow oil exploration companies to reduce or enlarge concessionary areas depending on drilling results, and provide longer term concessions in the event new and more time-consuming technologies were employed to explore for oil. A major controversial item which might hold up the draft legislation is a provision which would reallocate at least part of all gas production (now reserved to ENI's distribution network) to the major petroleum companies for use in their own marketing channels.[3]

AGIP, a wholly owned subsidiary of state-owned ENI, announced an oil discovery at Cavone, about 25 kilometers north of Modena. The third well in the area was an oil producer from depths of 3,000 meters. Drilling in this area was part of ENI's intensive deep exploration program in the Po Valley. Reportedly, the oil has a density of 24° API and contains 2.5% sulfur. Reports indicated a peakout production of 1 million tons per year.

Total offshore concessions now cover 20,000 square miles of the 34,000 square miles available in Italy, of which AGIP holds approximately 10,000 square miles. To date, 32 deposits (results of 235 wells) have been discovered offshore with petroleum and gas reserves estimated at 75-100 million tons oil equivalent. Elf and Total of France and Exxon have already announced intention to drill in the area. Exxon's request is particularly noteworthy since it previously had never actively explored for hydrocarbons in the Italian waters.

Montedison SpA, Italy's biggest chemical group, confirmed discovery of oil in a field 6 kilometers offshore of Marina di Ragusa, Sicily, at a depth of 3,500 meters. Further drilling was needed to determine the size of the field and its commercial value.

AGIP began exploration in deep-water zone F, encompassing the continental shelf in the southern Adriatic and Ionian Seas. This zone was opened for preliminary research to the ENI group 3 years ago. AGIP was granted nine exploration permits for approximately 6,700 square kilometers, or 25% of the area. The remaining 75% was opened to private oil companies.

In the northern part of the Adriatic, a consortium made up of AGIP (Italy), Elf (France), and Ina-Naftaplin (Yugoslavia), was drilling offshore Trieste. At the beginning of 1979, the well was 6,500 meters deep and had reached Triassic formations, which are producers in deep zones of the Valley of Po.

Production of crude oil in Italy was hardly more than symbolic (1 million tons) when compared with demand of over 110 million tons; no substantial oil reserves are known in Italy, and the country was heavily dependent on imports.

At the beginning of 1979, there were 29 refineries in operation in Italy with an installed capacity of 160 million tons per year. Imports of crude were over 103 million tons. Saudi Arabia (30%), Iran (14%), Iraq (14%), and Libya (13%) were the largest suppliers of crude oil to Italy.

The Mineral Industry of Japan

By Edmond Chin[1]

Following the world oil crisis in 1973, Japanese industries entered a period of adjustment by retiring excess and unprofitable capacity, reducing manpower, liquidating debts, and promoting energy conservation. Japan is highly reliant on imported energy; in fact, 90% of its primary energy needs are met by imports. The dependence is the highest among the industrialized countries of the world. Despite energy dependence and attendent imported inflation due to rapid, incremental oil price increases, Japan's economy rebounded sharply in 1974-75 and stabilized in 1976-79.[2] In terms of current prices, Japan's gross national product (GNP)[3] increased from $692.2 billion[4] in 1977 to $976.4 billion in 1978 and reached $1,031.9 billion in 1979. At constant 1970 prices, GNP in 1977 was $391.7 billion; in 1978, $531.6 billion; and in 1979, $551.0 billion.

Even with a strong industrial base, Japan continued to be buffeted by higher oil prices ($13 per barrel in December 1978 compared with $27 per barrel in December 1979), deteriorating balance of payments, currency fluctuations, and mounting strain with trade-partner countries.

During 1978, the dollar slumped to Y175.50 on October 31 but rose to Y200 on December 1. During 1979, the rate rose to Y210 on April 2, Y220 on May 1, and Y250 on November 27. As a result of the weakened yen and higher crude oil prices, the wholesale price index for all commodities increased 7.3% compared to an increase of 3.5% of the consumer index. To thwart imported inflation, the Bank of Japan raised the official discount rate to tighten credit in 1979. Effective April 17, the official rate was increased by 0.75% to 4.25%; effective July 24, 5.25%; and effective November 2, 6.25%.

Because of worldwide recession, Japanese industries had reduced their operating rate to about 80%. To cope with low economic growth, industry retrenchment helped to reduce overall costs and debts to lower the break-even point for profits. The Government had promoted public work projects in 1977-78 to stimulate business and had lowered the prime discount rate to alleviate the burden of interest rates on business enterprises and industry. In 1979, demand was on an upswing, and along with prior plant and equipment investments, industry was able to increase operating rates and also to increase profits. By mid-1979, the steel industry, automotive makers, petroleum refiners, and electrical and heavy machinery manufactures were having pretax profits. On the other hand, the construction industry continued its slump as a result of slowed Government orders, which was followed by deteriorating earnings by the cement producers. The power utility industry was increasingly affected by the markups in oil prices and the declining value of the yen; pretax profits in this sector fell close to 70% in 1979.

Despite fiscal and monetary controls, Japanese commodity prices fluctuated widely during 1979. According to the Nikkei index of commodity prices (based on 17 items), there was a 21% rate in fluctuation between the high and low price in 1979, compared with 8% in 1978. The largest upswing in price was naturally for petroleum products (gasoline, kerosine, and fuel oil), which had a 79% fluctuation rate; followed by nonferrous metals, 52%; construction materials, 38%; and chemicals, 35%. The commodities least sensitive to price fluctuations during the year were steel and textiles.

Japan's labor unemployment problems were recovering from the prolonged recession. At the beginning of 1979, there were two applicants for every job offer. By the end of the year, the ratio was reduced to five applicants for four jobs. It was expected that unless the economy suddenly declined, there would be a favorable upturn in employment in 1980 as industry increased recruitment for new employees. During the fall of 1979, the steel industry had agreed to extend the mandatory retirement age from 55 years to 60 years starting in 1981. The Ministry of Labor was working on a policy to set mandatory retirement at 60 years in 1985. Companies which had set mandatory retirement at 55 years were reviewing wages and personnel management, inasmuch as a seniority-based wage system increases personnel costs by extending the retirement age. In 1979, the wholly unemployed in Japan numbered 1.1 million, and the unemployment rate was slightly above 2%.

Japanese exports reached $100 billion in 1979.[5] Growth in exports was boosted by shipments of cement and steel to the Middle East, especially Iraq, Kuwait, and Saudi Arabia, and Japanese products to China. Significantly, the higher labor costs and inflation in South Korea and Taiwan enabled some Japanese products to regain price competitiveness in foreign markets.

At the end of fiscal year (FY) 1977 (March 1978), Japan's balance of payments surplus was $13.9 billion. By the end of FY 1978, there was a deficit of $7.6 billion. The FY 1979 deficit was estimated between $11.3 billion and $14.1 billion. The main cause of the downturn was that exports did not grow under the higher value of the yen while import payments increased drastically owing to demand and the oil price hikes. Estimates by financial institutions and economic research centers of the deficit in the balance of current accounts in FY 1979 ranged from $11.3 billion to $14.1 billion, and for FY 1980 from $2.4 to $14.9 billion.

Japan ranks fourth after the United States, the United Kingdom, and the Federal Republic of Germany in overseas investments. Japan's outstanding balance reached $25.7 billion on an application-approval basis at the end of 1978. Authorized direct investments abroad reached $4.6 billion in FY 1978, surpassing the peak record of $3.5 billion in FY 1973. Investments in North America accounted for almost 25%, of which 90% was in the United States. Investments in Asia accounted for 30%, particularly in Hong Kong, Indonesia, and South Korea. The remainder was distributed in South and Central America, the Middle East, and Oceania. By types, service industries accounted for nearly 40% of total investments, followed by manufacturing, 36%; and resource development, 24%.

Japan's aid budget accounted for a little over 1% of the GNP, the pledged goal assessed by the Organization for Economic Cooperation and Development. Japan's economic cooperation in 1978 was as follows in percent: Asia, 31; Latin America, 30; Middle East, 26; Africa, 9; and all other, 4.

Domestic investment in research and development totaled Y4,045.5 billion in 1979, of which Y2,291 billion was contributed by industry. About 88.2% of the total research and development expenditure was in science and technology. Projects receiving the largest investments were nuclear energy, information processing, environmental protection, space research, and ocean development. Investments in these projects were estimated at Y456.3 billion in 1979, compared with Y546.2 billion in 1978.

Industrial plant contracts were estimated to have reached $11.4 billion in 1979. Most of the outstanding contracts with China became effective in 1979, amounting to about $3 billion; and new contracts were concluded with Middle East oil-producing nations, such as Iraq and Saudi Arabia. Factors contributing to brisk industrial plant sales included depreciation of the yen to the U.S. dollar, upgraded technological levels, confidence in Japanese expertise, and the Government's financing programs. Most of the sales currently centered around exports of large petroleum-related plant facilities to oil-producing countries, and industrial complexes to developing nations, such as the Baoshan iron and steel complex in China and desalination plants in Saudi Arabia.

Domestic orders for pollution control equipment totaled Y528,505 million in 1978 compared with Y490,000 million in 1977 and Y380,000 million in 1976. By type of pollution control, orders in water treatment accounted for 61.8% of total sales in 1978; air pollution, 17.2%; refuse, 20.5%; and noise and vibration, 0.5%. Overseas sales of pollution control equipment were negligible, accounting for a little over 6% in total orders.

In 1979, the Mitsubishi group of companies formed Ryowa Ocean Development Co. to explore ocean-bottom resources. Ocean Management, Inc., in which Sumitomo is a member, was preparing to enter commercial operations in mining manganese nodules in the seabed off Hawaii. Ocean Farm Study Group was studying the feasibility of using bacterial species to ferment seaweed to produce methane gas.

PRODUCTION

Japan is much more important as a consumer of raw materials for the production of diverse, large-volume intermediate and finished goods than as an ore producer. There is significant mine output of dolomite and seawater magnesia, iron ore, copper, lead and zinc, manganese, and salt.[6] However, large imports of mineral commodities are required to meet Japan's industrial needs to produce value-added goods. Some industries are almost wholly dependent on imported raw materials; for instance, the petrochemicals and aluminum sectors.

In terms of mineral and metal processing, Japan's industries are very prominent, and output of refined metals and mineral products is large by world standards. Japan ranks with the top 10 producing countries in output of aluminum, copper, iron and steel, and zinc metal; cement and fertilizers; and refined oil and petrochemicals. It is also a major producer of lesser minerals, metals, and products such as bismuth, indium, selenium, lime, magnesia, halogens, and industrial gases.

Asphalt and bitumen do	24,972	28,103	31,219	[1]30,618
Liquefied petroleum gas do	50,592	37,135	48,645	[1]52,413
Naphtha do	180,897	126,796	120,057	[1]118,563
Paraffin do	885	1,132	1,088	[1]1,195
Petroleum coke do	1,143	1,730	440	[1]503
Unfinished oils do	47,489	44,224	38,300	[1]45,362
Refinery fuel and losses do	92,353	125,446	110,768	[1]83,441
Total do	1,680,626	1,701,463	1,687,924	1,695,906

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.
[1]Reported figure.
[2]Revised to none.
[3]Includes (but not limited to) ferromolybdenum, ferrotungsten, ferrovanadium, and silicochromium.
[4]Includes a small amount of natural coke.
[5]Includes output from gas mines and coal mines.

TRADE

During the past decade, Japan's total trade grew from Y11.2 trillion in 1969 to Y46.8 trillion in 1979. Japan had a deficit trade balance for the years 1973-75 and for 1979. Total exports in 1978 and 1979 were Y20.6 trillion and Y22.5 trillion, respectively; corresponding imports were Y16.7 trillion and Y24.6 trillion, respectively. The United States continued to be Japan's major trading partner, with 22% of total Japanese trade in 1979. Exports to the United States were valued at Y5.8 trillion, compared with Y4.6 trillion for U.S. shipments to Japan in 1979. Other major trading partners in 1979 were as follows, in order of total trade expressed in billion yen: Republic of Korea, 2,091; Australia, 1,948; Federal Republic of Germany, 1,497; Taiwan, 1,493; China, 1,452; United Kingdom, 1,041; U.S.S.R., 954; and Hong Kong, 950.

Receipts of mineral fuels, valued at Y9,986.9 billion in 1979, were by far the highest valued import class. Imports of crude oil alone were over Y7,165.7 billion. Imports of nonmetallic and metal ores were Y171.1 billion and Y1,292.6 billion, respectively. The value of imports of base metals and semimanufactures were as follows in billion yen: Iron and steel, 333.5; copper, 181.9; nickel, 66.2; aluminum, 278.9; magnesium and beryllium, 6.8; lead, 16.5; zinc, 6.9; and tin, 98.7.

In comparison, total exports of metals and semimanufactures totaled Y4,036.1 billion, of which shipments of iron and steel comprised 88% of the total value. Other major export categories included mechanical and electrical appliances and equipment, Y6,084 billion; transport vehicles and equipment, Y5,868 billion; and chemicals, Y1,084 billion.

Table 2.—Japan: Exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal destinations, 1978
METALS			
Aluminum:			
Bauxite and concentrate	660	1,821	Republic of Korea 1,800.
Oxide (alumina) and hydroxide thousand tons	203	175	Austria 63; Republic of Korea 57.
Fused alumina (artificial corundum)	11,175	12,949	Republic of Korea 6,798; Taiwan 4,472.
Metal including alloys, all forms thousand tons	193	205	United States 60; Republic of Korea 46; Iran 19.
Arsenic trioxide, pentoxide, acids	12	6	Republic of Korea 3; Taiwan 3.
Beryllium metal including alloys, all forms kilograms	223	237	All to Taiwan.
Bismuth metal including alloys, all forms	302	288	United States 170; U.S.S.R. 35; Netherlands 34.
Cadmium metal including alloys, all forms	784	111	United Kingdom 69; India 17; Taiwan 16.
Chromium:			
Chromite	2,805	1,636	Republic of Korea 1,613.
Oxide and hydroxide	2,033	1,562	United States 594; Taiwan 445; Republic of Korea 343.
Cobalt oxide and hydroxide thousand tons	10	87	Netherlands 41; West Germany 35.
Columbium and tantalum: Tantalum metal including alloys, all forms kilograms	45,469	41,290	West Germany 36,339.
Copper:			
Copper sulfate	560	325	Taiwan 214; Thailand 50.
Metal including alloys, all forms thousand tons	224	244	Taiwan 42; United States 39; Republic of Korea 33.
Iron and steel:			
Ore and concentrate	12	18	All to Taiwan.
Metal:			
Scrap	210,740	164,395	Republic of Korea 118,781; Hong Kong 33,466.
Pig iron, including cast iron[2]	563,911	32,678	Vietnam 16,300; Pakistan 11,000.
Sponge iron, powder, shot	10,602	10,585	Taiwan 2,267; Republic of Korea 2,259; Australia 1,456.
Ferroalloys:			
Ferromanganese thousand tons	49	37	China, mainland, 23.
Other do	27	31	United States 20; Netherlands 7.
Steel, primary forms do	4,659	4,428	Republic of Korea 1,007; China, mainland, 716; United States 465.

See footnotes at end of table.

Semimanufactures:			
Bars, rods, angles, shapes, sections thousand tons	7,571	6,166	China, mainland, 1,354; United States 1,195.
Universals, plates, sheets:			
Uncoated universals, plates, sheets do	10,999	10,372	China, mainland, 1,825; United States 950; Republic of Korea 651.
Tinned plates and sheets do	908	815	United States 200; China, mainland, 94; Philippines 62; U.S.S.R. 52.
Other coated plates and sheets do	2,580	2,315	United States 1,074.
Hoop and strip do	1,006	812	China, mainland, 163; Indonesia 67; Iran 66.
Rails and accessories do	218	193	China, mainland, 48; Brazil 43; United States 10.
Wire do	456	367	United States 191.
Tubes, pipes, fittings do	5,206	6,280	United States 1,403; U.S.S.R. 1,126; China, mainland, 566.
Castings and forgings, rough do	30	31	United States 17.
Lead:			
Ore and concentrate	6,964	9,312	United States 4,012; U.S.S.R. 4,000.
Oxide	388	1,021	Tanzania 300; Republic of Korea 158.
Metal including alloys, all forms thousand tons	12	10	Republic of Korea 6.
Magnesium metal including alloys, all forms	405	313	Republic of Korea 155; India 60; North Korea 60.
Manganese:			
Ore and concentrate	5,206	4,831	Republic of Korea 2,691; Burma 540.
Oxides thousand tons	24	22	United States 4; Republic of Korea 3; Indonesia 2.
Mercury 76-pound flasks	2,299	6,929	United States 4,341; Republic of Korea 961; Taiwan 651.
Molybdenum metal including alloys, all forms	43	39	Hungary 17; Republic of Korea 6; China: Mainland 5 and Taiwan 4.
Nickel:			
Ore and concentrate	30	--	
Metal including alloys, all forms	6,083	5,242	India 1,565; United States 524; Australia 411; Brazil 351.
Phosphorus, elemental (red)	98	148	Taiwan 44; India 34; Vietnam 30.
Platinum-group metals and silver:			
Waste and sweepings	5	15	All to Republic of Korea.
Metals including alloys:			
Platinum-group thousand troy ounces	r123	123	Taiwan 80; Republic of Korea 23.
Silver do	2,343	3,015	Republic of Korea 1,115; United States 945; Taiwan 769.
Selenium, elemental	296	264	Netherlands 94; United Kingdom 62; United States 48.
Tin:			
Oxides	3	11	United States 5; Thailand 3.
Metal including alloys, all forms	r942	487	Republic of Korea 84; Taiwan 21.
Titanium:			
Oxide thousand tons	18	11	Taiwan 4; Republic of Korea 2; United States 1.
Metal including alloys, all forms	2,312	4,176	United Kingdom 1,463; West Germany 963; United States 843.
Tungsten metal including alloys, all forms	130	172	Malaysia 38; Austria 36; United States 20.
Zinc:			
Oxide	1,761	1,322	Taiwan 424; Republic of Korea 306; Burma 236.
Metal including alloys, all forms thousand tons	77	67	Republic of Korea 20; United States 12; Taiwan 11.
Other:			
Ores and concentrates:			
Of molybdenum, tantalum, titanium, vanadium, zirconium	678	1,398	Republic of Korea 1,005.
Of base metals, n.e.s	5	153	Romania 150.
Ash and residue containing nonferrous metals	6,279	5,123	United Kingdom 1,067; United States 1,028.
Oxides, hydroxides, peroxides of metals	1,361	2,164	Republic of Korea 556; Taiwan 325; Indonesia 305; United States 291.

Metals including alloys, all forms:			
Phosphorus and other metalloids	246	149	Republic of Korea 68; Malaysia 22; United States 15.
Alkali, alkaline-earth, rare-earth metals	292	688	Taiwan 398; United States 174; West Germany 74.
Pyrophoric alloys	76	81	France 30; United States 22.
Base metals including alloys, all forms, n.e.s	5,982	7,236	United States 2,434; Belgium-Luxembourg 561; German Democratic Republic 555.
NONMETALS			
Abrasives, natural, n.e.s.:			
Emery	1,134	1,429	Taiwan 639; Republic of Korea 491.
Dust and powder of precious and semiprecious stones thousand carats	1,111	1,168	United States 564; Republic of Korea 474; Taiwan 117.
Grinding and polishing wheels and stones	4,721	4,868	United States 569; Thailand 567; Hong Kong 505.
Other	147	416	Republic of Korea 304; Taiwan 38; Malaysia 32.
Asbestos	1,226	756	Taiwan 365; Republic of Korea 297.
Barite and witherite	1,250	2,894	U.S.S.R. 2,889.
Boron materials:			
Crude natural borates	17	285	Republic of Korea 275.
Oxide and acid	382	120	Taiwan 71; Republic of Korea 37.
Cement thousand tons	6,683	8,624	Saudi Arabia 2,032; Singapore 1,120; United States 1,042.
Chalk	17	50	Singapore 40.
Clays and clay products (including all refractory brick):			
Crude	53,360	64,171	Taiwan 37,920; Republic of Korea 11,454.
Products:			
Refractory	165,203	167,655	Republic of Korea 51,668; Taiwan 21,361.
Nonrefractory[3]	55,410	48,442	United States 15,419; Singapore 8,480; Hong Kong 5,893.
Cryolite and chiolite	2	--	
Diamond:			
Gem, not set or strung carats	798	232	Republic of Korea 230.
Industrial thousand carats	1	1	All to Republic of Korea.
Diatomite and other infusorial earth	1,024	1,298	China: Mainland 272 and Taiwan 466.
Feldspar, fluorspar, and related materials:			
Feldspar	11,224	15,157	Taiwan 13,869.
Fluorspar, leucite, nepheline, nepheline syenite	840	532	Vietnam 300; Cuba 100.
Fertilizer materials:			
Manufactured:			
Nitrogenous[4]	2,478	2,030	China, mainland, 1,215; India 98; Vietnam 86.
Phosphatic thousand tons	23	11	Burma 3; Fiji 2; Taiwan 2; Thailand 2.
Potassic do	2	4	All to Republic of Korea.
Other, including mixed do	43	64	Sri Lanka 25; Zambia 17.
Ammonia	242,768	201,108	Philippines 192,356.
Graphite, natural	1,311	1,406	Taiwan 929; United States 216.
Gypsum and plasters	6,474	6,172	Republic of Korea 2,238; Taiwan 2,047.
Kyanite and related materials	16,496	16,470	Taiwan 12,508; Republic of Korea 2,328; Thailand 1,161.
Lime	29,287	33,290	Papua New Guinea 23,600.
Magnesite	5,299	17	Thailand 10; Republic of Korea 7.
Mica	411	783	Taiwan 302; Hong Kong 287.
Pigments, mineral: Iron oxides, processed	12,554	15,589	Taiwan 6,452; United States 2,659; Republic of Korea 1,051.
Precious and semiprecious stones, except diamond:			
Natural kilograms	135,208	75,753	Republic of Korea 39,441; Taiwan 22,685.
Manufactured do	26,826	24,108	Republic of Korea 11,819; West Germany 5,035; United States 1,112.
Salt and brines	958	2,934	United States 1,169; Papua New Guinea 1,023.
Sodium and potassium compounds, n.e.s.:			
Caustic soda thousand tons	164	146	Australia 125; Republic of Korea 13; United States 6.
Caustic potash and sodic and potassic peroxides do	5	5	Australia 2; Republic of Korea 1; Taiwan 1.
Stone, sand and gravel:			
Dimension stone	r322	1,507	Republic of Korea 1,168.
Dolomite, chiefly refractory grade	6,340	5,399	Philippines 4,610; Taiwan 445.

See footnotes at end of table.

Colloidal	519	220	Republic of Korea 156; Cuba 34; Iraq 15.
Other than colloidal	467,929	320,986	Republic of Korea 250,541; Taiwan 66,590.
Sulfur dioxide	20	66	Republic of Korea 28; Taiwan 22.
Sulfuric acid thousand tons	290	325	Philippines 107; Peru 48; Turkey 34; Spain 33.
Talc and steatite	1,721	1,803	Taiwan 609; Vietnam 430; Philippines 204.
Other:			
Crude thousand tons	9	10	Republic of Korea 4; Taiwan 2.
Slag, dross, and similar waste, not metal bearing do	218	518	Republic of Korea 363; Philippines 81.
Oxides, hydroxides, and peroxides of magnesium, strontium, barium (including clinker) do	145	149	Poland 30; Australia 25; United Kingdom 24.
Bromine, iodine, fluorine	5,484	6,020	United States 2,621; United Kingdom 682; France 605.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	9	7	Taiwan 6.
Carbon black and gas carbon:			
Carbon black thousand tons	23	31	China, mainland, 17; Indonesia 3; India 2.
Gas carbon	--	26	All to Kuwait.
Coal, all grades, including briquets thousand tons	32	48	Republic of Korea 25; North Korea 17.
Coke and semicoke do	530	896	United States 304; Chile 129; Peru 106.
Gas, manufactured only	(5)	(5)	
Hydrogen and rare gases (helium, krypton, neon, xenon) do	799	1,156	Taiwan 302; Iran 262.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	(6)	--	
Refinery products, nonbunker:			
Kerosine and jet fuel do	7	1,508	Indonesia 974; India 363; Singapore 161.
Distillate fuel oil do	5	503	Thailand 333; New Zealand 167.
Residual fuel oil do	72	233	Republic of Korea 232.
Lubricants do	2,066	2,350	Republic of Korea 847; Taiwan 276; Indonesia 250.
Other:			
Liquefied petroleum gas do	40	282	Hong Kong 181; Philippines 80.
Naphtha do	28	51	Taiwan 41.
Mineral jelly and wax do	447	565	Mexico 63; Republic of Korea 62; Taiwan 48.
Petroleum coke do	89	33	West Germany 30.
Bitumen do	39	6	Indonesia 2; Republic of Korea 2.
Unspecified	r81	101	Republic of Korea 54; Taiwan 15; India 14.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons	78	149	NA.

rRevised. NA Not available.

[1]Excludes exports under the Japanese-United States Mutual Defense Agreement and those for the account of the U.S. military forces.

[2]Includes spiegeleisen, if any.

[3]Excludes mosaic tile.

[4]Includes exports containing more than 45% N.

[5]Same as gas carbon.

[6]Less than 1/2 unit.

Table 3.—Japan: Imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	Principal sources, 1978
METALS			
Aluminum:			
Bauxite and concentrate thousand tons	5,318	4,743	Australia 3,245; Indonesia 990; Malaysia 417.
Oxide and hydroxide do	r940	759	Australia 744.
Fused alumina (artificial corundum)	3,942	5,769	India 3,283; Austria 996; Brazil 970.
Metal including alloys:			
Scrap thousand tons	70	140	United States 108.
Unwrought do	534	740	Canada 124; New Zealand 121; Bahrain 113.
Semimanufactures do	23	26	Romania 7; France 2; United States 2; Yugoslavia 2.
Antimony:			
Ore and concentrate	7,501	6,553	Bolivia 4,699; Thailand 1,032.
Metal including alloys, all forms	1,239	1,611	China, mainland, 1,578.
Arsenic:			
Natural sulfides	4	10	All from China, mainland.
Trioxide, pentoxide, acids	1,076	755	France 430; China, mainland, 215; Sweden 101.
Beryllium metal including alloys, all forms kilograms	6,098	1,674	All from United States.
Chromium:			
Ore and concentrate thousand tons	900	670	Republic of South Africa 350; Philippines 74; India 73.
Oxide and hydroxide	3,061	3,505	United States 1,791; West Germany 799; U.S.S.R. 778.
Cobalt:			
Oxide and hydroxide	597	615	Belgium-Luxembourg 522; Canada 52.
Metal including alloys, all forms	2,083	1,351	Zaire 697; Belgium-Luxembourg 292.
Columbium and tantalum:			
Columbium (niobium) ore and concentrate	1,751	1,858	Canada 1,316.
Tantalum:			
Ore and concentrate	170	128	Malaysia 77; Australia 46.
Metal including alloys, all forms	47	46	United States 39.
Copper:			
Ore and concentrate thousand tons	2,823	2,818	Canada 821; Philippines 818.
Copper sulfate[2]	378	553	China: Mainland, 105 and Taiwan 158.
Metal including alloys:			
Scrap thousand tons	41	55	United States 31; Hong Kong 10.
Unwrought do	272	280	Zambia 89; Chile 64; Peru 55.
Semimanufactures	1,239	1,359	United States 826; Belgium-Luxembourg 108.
Germanium:			
Dioxide	8	12	West Germany 8; U.S.S.R. 4.
Metal including alloys, all forms kilograms	826	1	All from Belgium-Luxembourg.
Gold metal thousand troy ounces	1,661	3,167	Switzerland 1,886; United Kingdom 987.
Indium metal including alloys, all forms kilograms	1,262	2,774	United States 879; West Germany 577; Peru 527.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	132,571	114,645	Australia 52,626; Brazil 20,816; India 14,355.
Roasted pyrite	17,556	2,891	Philippines 2,800.
Metal:			
Scrap thousand tons	1,448	3,229	United States 2,691; Australia 172; U.S.S.R. 165.
Pig iron, including cast iron do	543	640	Canada 125; Mexico 84; Romania 78; Australia 71.
Sponge iron, powder, shot do	7	6	All from Sweden.
Ferroalloys do	191	361	Republic of South Africa 151; Brazil 44; Norway 30.
Steel, primary forms do	160	149	Romania 46; United States 46.
Semimanufactures do	36	24	Sweden 3; United States 3; United Kingdom 2.
Lead:			
Ore and concentrate do	194	222	Canada 154.
Oxides	511	766	Mexico 468; Bulgaria 239.
Metal including alloys:			
Scrap	2,856	6,704	United States 3,552; Canada 2,012.
Unwrought	32,075	59,341	North Korea 19,285; Mexico 10,135; Australia 7,534.
Semimanufactures	12	17	United States 15.
Magnesium metal including alloys, all forms	2,760	9,115	United States 5,954; Norway 1,571; Canada 996.
Manganese:			
Ore and concentrate[3] thousand tons	2,754	2,012	Republic of South Africa 693; India 483; Australia 444.

Paraffin do	27	55	Singapore 27; United States 22.
Petroleum coke do	10,171	10,053	United States 8,145.
Unspecified do	65	228	United States 85.
Total do	237,186	212,535	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons	137	127	Republic of Korea 62; Taiwan 33; United States 14.

[r]Revised.
[1]Excludes imports under the Japanese-United States Mutual Defense Agreement and those for the account of the U.S. military forces.
[2]Includes zinc sulfate.
[3]Includes ferruginous manganese and manganese dioxide.
[4]Includes cerium fluoride and lanthanum nitrate.
[5]Includes phosphorus, lithium, boron, and arsenic.
[6]Less than 1/2 unit.
[7]Includes naphtha.

COMMODITY REVIEW

METALS

Aluminum.—Japan is the second largest aluminum producing and consuming nation in the world after the United States. Its capacity to produce metal totals 1.64 million tons per year, and its primary ingot consumption amounts to 1.8 million tons annually. However, Japan's industry is at a competitive disadvantage inasmuch as it must import all of its bauxite-alumina needs (mostly from Australia, Indonesia, and Malaysia). Furthermore, alumina reduction is highly energy intensive, and Japanese electricity rates have risen sharply owing to higher oil prices and to a higher percentage of oil-fired thermal power generation in Japan. Thus, increasing amounts of foreign aluminum metal—less costly than Japanese metal—have been imported.

Nippon Light Metal Co., Sumitomo Aluminum Smelting Co., Mitsubishi Light Metal Industries, Ltd., Showa Keikinzoku K.K., and Mitsui Aluminium Co. have collectively incurred an accumulated loss since the oil crisis of nearly Y100 billion at the end of FY 1980. These companies formed an antidepression cartel in September 1978 to reduce output and to increase ingot prices. The industry resolved to freeze 530,000 tons of annual capacity until June 1983, thereby also lowering excess inventory. Ingot prices were raised incrementally in four stages in 1979, and the fifth hike scheduled for January 1980 was to bring ingot price 51% higher than the price level at the end of 1978.

To improve their weakened domestic position, Japanese aluminum producers were involved with overseas ventures. The Asahan project in North Sumatra, a Japanese-Indonesian venture, was estimated to cost initially Y250 billion. The Amazon project, a joint Brazilian-Japanese venture, was established in October 1978. Both projects, owing to their high cost and the depressed financial status of the domestic industry, are Japanese-Government-supported national ventures.

Venezuela de Aluminio CA, a Venezuelan-Japanese project, started operations in June 1978. The first shipment of metal from this venture—7,000 tons of ingot—arrived in Japan in January 1979. Japanese producers are also tied in with New Zealand Aluminum Smelters, Ltd.

Copper, Lead, and Zinc.—Japan's lead and zinc industry is intertwined, and producers of lead and zinc are producers of copper as well.[7] The major mining and smelting companies include Dowa Mining Co., Ltd., Furukawa Mining Co., Ltd. (copper only), Mitsubishi Metal Corp., Mitsui Mining & Smelting Co., Ltd., Nippon Mining Co., Ltd., Nisso Smelting Co., Ltd. (lead and zinc only), Nittetsu Mining Co., Ltd. (copper only), Sumitomo Metal Mining Co., Ltd., and Toho Zinc Co., Ltd. (lead and zinc only).

The industry recovered in 1979 as a result of increased demand, the decline in yen value, and higher international quotation for metals. Mines were reopened which had been shut down in 1978. The rise in smelting costs is a major concern for Japanese metal producers, particularly in the case of lead, where the electrical consumption rate is high.

Japan consumes significant amounts of copper, about 1.2 million tons per year, for the manufacture of wire and cable, and brass. Production of refined copper is currently around 0.96 million tons. In 1978, when smelters purchased foreign ore at advantageous prices, the use of domestic ores sharply decreased to 6% of the total refined copper output during the year.

Lead consumption was about 270,000 tons per year, principally for storage batteries and inorganic chemicals. Output of refined lead runs about 230,000 tons annually. Mine output of lead ores has remained at a level of 60,000 tons during the past decade; however, imported ores increased at an average annual rate of 4.5% during the period to about 127,000 tons in 1978-79.

Zinc consumption is about 715,000 tons annually compared with production of 770,000 tons of slab zinc. In Japan, zinc is used mainly in galvanized sheet and other plating (tube and wire), in brass, and in diecasting. The share of domestic ores used in zinc metal production has increased slightly, from 230,000 tons to 260,000 tons, in this decade, while use of imported ore increased from 330,000 tons to 425,000 tons.

Japanese industry is involved with the development of the Musashi copper mine in Zaire and the Mamut copper mine in Malaysia. Both mines are problematic as to profitability, and in 1978 both were given a 3-year moratorium for their loans from the

Export-Import Bank of Japan and the Industrial Bank of Japan. Also, Japanese nonferrous metal producers were increasingly interested in participating in ore mine development projects in China.

Iron and Steel.—Japan's iron and steel industry is one of the largest in the world and has some of the world's most modern and efficient facilities.[8] There were 69 blast furnaces in operation in 1979. Large-volume blast furnaces, above 2,000 cubic meters each, numbered 39, of which 14 were larger than 4,000 cubic meteres in size. The largest blast furnace in Japan has an inner volume of 5,070 cubic meters. As for steelmaking, the number of basic oxygen furnaces totaled 94. Continuous casters totaled 131, producing upward of 40 million tons of semimanufactures each year. Efforts were made to increase the continuous casting ratio, and by the beginning of 1979, 46.2% of crude steel semimanufactures were made by this process.

Production of crude steel was over 110 million tons in 1979. By production type, basic oxygen furnaces accounted for about 77% of the annual output and electric furnaces for 23%. Continuous casting of semifinished steels for rolling was 85.75 million tons in 1978 and special steels for rolling, 14.5 million tons. Production by continuous caster expanded significantly from 41.6% of total semifinished steel output in 1977 to 46.2% in 1978.

Iron ore consumption in Japan ranges between 115 and 125 million tons annually. Domestic ore, including iron sands, pyrite sinter, and pellets, accounts for about 1.5% of total consumption. Japan's dependency on imports of ore, over 98%, is met from receipts primarily from Australia, Brazil, and India. The share of lump ores (sinter and pellets) rose from 2% in 1977 to 87.3% in 1978, a notable change in raw materials supply.

Annual coking coal consumption averages between 55 and 60 million tons. Apparent consumption of coal per ton of pig iron produced was lowered to 710 kilograms in 1978 from 732 kilograms in the previous year. Imported coking coal represents about 88% of total consumption. The top suppliers to Japan are Australia, Canada, the Republic of South Africa, and the United States.

Other raw materials consumed by the industry included substantial quantities of pig iron and scrap. Imports of pig iron in 1978 were about 650,000 tons, mainly from Canada, Romania, and Australia, in that order; and for scrap, 3.23 million tons, from the United States, Australia, and the U.S.S.R. Limestone and quicklime are locally available, while fluorspar consumption, around 200,000 tons annually, is imported from Thailand, China, and South Africa; and tin consumption, around 30,000 tons, is imported from Southeast Asia.

The major steel firms reported combined sales of $22.04 billion during the first half of FY 1978 with profits reaching $464.9 million. The return to profitability was based on an expansion of public works investments in Japan, rising domestic shipments of rolled steel, and the improvement in the unit price of steel. Furthermore, attempts were made in export markets to offset the high value of the year by raising export prices in dollar terms.

Equipment investment by the industry during FY 1978 totaled $2.83 billion on a construction basis, 13.2% lower than the previous year. Active investments were discouraged by existing surplus capacity over demand, the result of protracted weakness in the domestic and international steel market. Outlays for new facilities such as blast furnaces were much curtailed. However, plant maintenance and repairs were a main factor in the year's capital spending.

Equipment investment for pollution control totaled $302.4 million in 1978, down 22.1% from the prior year, reflecting the approaching completion of the industry's pollution control programs. The Government amended the air quality standard in July 1978, easing somewhat the emission standard for nitrogen oxides. The industry initiated joint activities to deal with NO_x research and development programs and to grant subsidies for related work by other institutions. The law covering water quality standards was revised in June 1978, the changes extending pollution controls to the total quantity of pollutants released. The industry responded by raising the water recycle rate to reduce the pollution load in waste waters, and by installing various waste-water treatment facilities. Also, maximum reuse of waste materials such as slag and dust was being studied in the industry's research programs.

In July 1979, Nipon Kohan completed the move of its Keihin steel works with an annual crude steel output of 6 million tons to Ohgishima, a manmade island in Tokyo Bay. The move to Ohgishima was made at a total cost of Y1,000 billion, and marks what observers believe to be the end of the fierce competition to build gigantic steel complexes, which had lasted for about 30 years among Japanese steelmakers.

Nickel.—For lack of indigenous resources, Japan imports all of its nickel needs. During the decade, nickel consumption grew at an annual rate of 4.3%. Consumption was highest in 1974, peaking at 113,000 tons, declining precipitously to 74,000 tons in 1975, rebounding to 108,000 tons in 1976, and remaining at a level of 90,000 tons in 1977-79.

About 80% of the demand is for special steels (especially stainless steel). Nickel consumption for special steels increased from 48,000 tons in 1968 to the current level of consumption, 69,000 tons annually. Plating and nonferrous alloying are other nickel uses, constituting about 10% and 4%, respectively, of the total demand.

New Caledonia is the largest supplier of nickel ores and mattes to Japan, followed by Indonesia. Since 1969 Japan has ranked second after Canada in the free world in terms of nickel metal production. Metal producers were Japan Metallurgical Industries, Nippon Mining Co., Pacific Metals Co., Ltd., Shimura Kako Co., Ltd., and Sumitomo Metal Mining Co.

Other Metals.—Aside from copper, lead, and zinc, metal mine output is generally small in Japan. For instance, manganese output from fewer than 20 mines totals only about 30,000 tons of contained manganese, insignificant in terms of volume imports from Australia, Mexico, and South Africa. Consumption of manganese dioxide is close to 30,000 tons annually, compared with close to 1 million tons of combined ferromanganese and silicomanganese used in the iron and steel industry.

Mine production of molybdenum is about 200 tons; that of tungsten concentrates is about 1,200 tons, as is that of antimony. Mine output of other metal values includes gold, silver, and platinum-group elements.

Japan, however, is a significant producer of byproduct metals including cadmium, indium, and selenium. Other values recovered include arsenic, bismuth, and gallium.

Japan harvests large quantities of magnesium from seawater operations. Most of the production is for the manufacture of basic refractories containing magnesium oxide; a very small part (about 10,000 tons) is used in the production of magnesium metal. Japan imports around 400,000 tons of ilmenite and rutile annually from Australia, Canada, India, Malaysia, and Sri Lanka. It is a significant producer of titanium dioxide pigment and a small producer of metal.

Japan also produces other metals of high purity, generally in quantities prominent by world standards. Production of refined metals and compounds, mostly from imported materials, includes chromium, germanium, rare earths, silicon, tantalum, and uranium.

NONMETALS

Cement.—Japan ranks with the United States and the U.S.S.R. as the foremost producers of cement in the world.[9] Total industry capacity to produce cement was around 110 million tons per year. Japan's cement industry dates back more than 100 years and is as old as its iron and steel industry. The industry grew rapidly with overall Japanese economic growth. Production surpassed 40 million tons in 1967, reached 78 million tons in 1973, and surpassed 85 million tons in 1979.

In November 1975, producer-members of the Cement Association of Japan formed the first antirecession cartel to reduce production levels to meet slumps in demand and to cope with low prices. Because of the oil crisis and ensuing recession, production was cut sharply during 1974-76. In 1977, demand began to recover as a result of public investments and new construction activities.

The industry is comprised of 24 companies with 60 plants and 490 distribution terminals employing around 11,800 persons. Eight plants each produce less than 0.5 million tons per year, 9 between 0.5 and 1.0, 9 between 1 and 1.5, 13 between 1.5 and 2.0, 7 between 2 and 2.5, and 4 between 2.5 and 3.0; 10 plants produce over 3 million tons annually. The average annual production capacity per plant in 1979 was 1,835,000 tons.

Onoda Cement Co. and Nihon Cement Co. are the old mainline producers, collectively sharing 16% to 18% of the market. These producers are followed by other nationwide operators, Mitsubishi Mining & Cement Co., Sumitomo Cement Co., and Ube Industries, Ltd.; and by regional producers, Chichiou Cement Co. (Tokyo and vicinity) and Osaka Cement Co. (Osaka and environs).

About 59% of the domestic sales are shipments of ready-mixed concrete, of which 95% is consumed for civil engineering projects and building construction. About 14% of total domestic sales is of concrete products. Exports account for close to 10% of the market, and miscellaneous uses for the remainder. By destination, Southeast Asia accounts for about 41% of total exports; West Asia, 43%; Oceania, 3%; and other areas, the remainder.

Prior to the stress placed on energy savings, producers were estimated to have consumed 90 liters of fuel oil "C" per ton of cement produced. In order to cope with soaring oil prices, manufacturers were attempting to switch to coal for firing kilns and also to switch to oil-fired dry kilns (rather than inefficient wet kilns) such as the new suspension preheaters (NSP).

Onoda Cement, Mitsubishi Mining & Cement, Chichibu Cement, and Nihon Cement have independently developed NSP technology. Compared with conventional kilns, energy cost savings of NSP were estimated to be around 20% in addition to doubling production efficiency. Japan's Environment Agency regulates nitrogen oxide (NO_x) emissions at 480 parts per million (ppm) for existing kilns and at 550 ppm for newly installed kilns. NO_x emissions by NSP-equipped kilns were less than 250 ppm. Within 2 to 3 years, it was expected that about 40% of Japan's total cement output would be by coal-fired facilities.

Fertilizer Materials.—Japan's chemical fertilizer industry is one of the largest in the world. However, the industry has been adversely affected by low plant operation rates due to international competitiveness, narrowing export markets, and increased costs. In 1979, the fertilizer producers collectively decided to reduce capacity by 1,158,400 metric tons per year for ammonia (29.7% of total capacity) and by 1,720,000 tons for urea (43.3%). Manufacturers who reduce capacity would share in a Y1.5 billion aid pool, provided under a formula developed by the Japan Urea and Ammonium Sulfate Industry Association. In addition, producers were to diversify into manufacture of nonfertilizer products as well as new fertilizer compounds and formulas. In FY 1980, permanent suspension of operations of large ammonia and urea units was expected in facilities of Nihon Ammonia Co. (a joint venture of Sumitomo, Showa Denko, and others) and by the Mitsubishi group. Previously Showa Denko, Sumitomo, Ube Industries, Inc., and Kyowa Hakko Kogyo Co. had retired surplus capacity. In April 1979, Kashima Ammonia Co. and Nippon Kasei Chemical Co., both part of the Mitsubishi group, were merged; plans were being made to freeze its ammonia and urea output until June 1983.

Although urea exports were expected to decline, total industry capacity reduction was based on annual export shipments of 1 million tons per year. While China completed construction of 11 of 13 pairs of large ammonia and urea plants in late 1979, Japan continued to export about 1 million tons of nitrogenous fertilizers to China.

Japan's fertilizer export association was attempting to diversify its distribution to new foreign destinations in face of competition from foreign producing countries. In addition, the Japanese Government continued to purchase a small volume of domestically produced urea and ammonium sulfate, given as aid to developing countries—Bolivia, India, Nepal, Pakistan, the Philippines, Sri Lanka, and Sudan.

Mitsubishi Chemical Industries and Zenno (National Federation of Agricultural Cooperative Association) agreed to participate with Estech General Chemicals (formerly Swift Chemicals of the United States) in the development of a phosphate rock project whereby 350,000 to 400,000 tons of phosphate would be shipped annually to Japan beginning in 1983. In another venture, Mitsubishi Corp. contracted with Arab Potash Co. to obtain 600,000 tons of potassium chloride a year for 1985-86 for sales throughout Asia and Oceania.

Salt.—Japan's output of salt, all from evaporites, averages about 1 million tons per year. Most of the industrial demand is met by imports primarily from Australia and Mexico. Imports of salt during 1977-79 have averaged about 6.5 million tons per year.

Aside from human consumption, salt is used mainly by the chlor-alkali industry in the production of caustic soda. Domestic production of caustic soda is around 3 million tons annually; significant quantities are exported, principally to Australia and South Korea. One of the main uses for caustic soda is in the Bayer process for alumina production.

Because of the mercury pollution in the 1960's, the Government decreed that the caustic soda industry eliminate the use of mercury cells by December 1984. By 1978, mercury cell capacity was 1.8 million tons out of total soda capacity of 4.5 million tons annually. Commercial development of iron exchange membranes for chlor-alkali production in Japan was led by Asahi Glass Co. and Asahi Chemical Industry Co. The latter company signed licensing agreements with Prince Albert Pulp Co. and St. Anne

Nackawic Pulp and Paper Co., both of Canada, and with Akzo Zont Chemie Nederland B.V. Additionally, Asahi Chemical signed agreements with four electrode manufacturers in the United States and Europe for the production of electrodes for the licensees of Asahi Chemicals process. Asahi Glass was involved with similar agreements with Pittsburgh Plate Glass and Olin Corp., with Britain's Imperial Chemical Industries, Inc., and with Uhde GmbH, Hoechst A.G., and Bayer A.G. of the Federal Republic of Germany.

Other Nonmetals.—In addition to aggregates, Japan produces significant quantities of pyrite, byproduct sulfur, and pyrophyllite. Its chemical industry produces large quantities of halogens, lime, and sodium compounds. Sufficient quantities of gypsum are recovered for use by the cement manufacturers. Minor quantities of asbestos, barite, feldspar, and fluorspar are produced domestically.

MINERAL FUELS

Coal.—The Government's national policy on domestic coal mining sets output at 20 million tons per year. However, coal production remained at the 18.5-million-ton level during the 1970's. To meet demand, Japan imports between 50 and 60 million tons of coal per year, with substantial receipts from Australia and the United States.

Domestic producers pushed for price hikes inasmuch as operating, transport, and personnel costs increased by Y730 per ton. However, the two principal users, electric utilities and the iron and steel industry, refused to accept increased prices equivalent to the increased operating costs. It was estimated that domestically produced coal was Y8,000 per ton higher than imported coal.

To compound the problem, the steel industry decreased receipts of domestic coal in 1979 from 7.3 million tons to 6.3 million tons, citing the worldwide slump in the steel market. Also, the steel producers feared that their competitiveness on the international market may drop if they use domestic coal whose prices were twice as high as imported coal.

Because the coal producers were at a disadvantage owing to pricing, stockpiles of coal began to swell as users preferred imported coal. Coal industry stocks were over 3 million tons by October 1978, and 3.7 million tons by March 1979, and were expected to reach 5 million tons by March 1980. The costs to stockpile the coal at company stockyards were estimated to be Y30 billion at the end of October 1978.

Japan's coal mining companies included Hokkaido Colliery & Steamship Co., Matsushim Kosan Co., Mitsubishi Coal Mining Co., Mitsui Coal Mining Co., Sumitomo Coal Mining Co., and Taiheiyo Coal Mining Co. While some companies incur a deficit up to Y1,200 per ton, the average industry loss was estimated at Y795. Hokkaido Colliery, suffering a cumulative deficit of Y120,000 million, began to revitalize its management plan in 1978. Its Yubari mine produced only 3,500 tons a day in 1979 compared to a target of 4,300 tons. Some seams were not suited for mining operations, and locations of others resulted in increased per-ton production costs. The gas explosion at its Horanai mine in 1975 where drilling operations reached 500 meters underground increased the industry's uneasiness over the danger in maintaining deep-seam mines. By March 1979, debtors such as Mitsui Bank, Ltd., and Misui & Co. stopped financing Hokkaido Colliery.

To aid the coal producers, the Government earmarked Y250 per ton as a subsidy to steel companies for each ton of domestic coal consumed. However, the steel companies felt that the subsidy was too small, and that they may be asked to increase intake of domestic coal.

Domestic coal producers tried investments in overseas operations, particularly in Australia, to alleviate financial difficulties at home. Australian foreign restriction law allows up to a 49% investment. However, Japanese developers' equities were only 15%, with the exception of Taiheiyo Coal, which was financially able to make a capital participation to the extent of 49%. Foreign coal development projects are costly for financially ailing Japanese companies, requiring large equity. The cost for obtaining a mining and exploration lease for a deposit having an annual production potential of 2 million tons was Y2,000 million. Furthermore, Y20,000 million is usually required to launch development activities. The Government was to provide financial assistance, on the other hand, for developing two Chinese coal mines, capable of producing 4 million tons per year.

Natural Gas.—Japan produces little natural gas and hence is involved with foreign countries in liquefied natural gas and petroleum gas (LNG and LPG) projects. Mitsubishi is involved with LNG in Brunei, Mitsui with LNG in Abu Dhabi, and Nissho-

Iwai Co. with LNG in Indonesia. Mitsui and Mitsubishi are jointly tied in with an LNG project in Australia. As to LPG production projects, C. Itoh was to start importing gas from Dubai in 1980, and Mitsui's status in Iran was undecided.

Petroleum.—Japan's domestic production of crude oil is insignificant compared with annual imports of around 280 million kiloliters. Because of its dependence on foreign oil, the industry faced increased cost for oil and the need to secure dependable supply. Oil-producing countries contended that higher prices were necessary to preserve oil resources. Following the political chaos in Iran, producing nations also initiated direct sales with users and Government-to-Government sales, bypassing major firms. By 1979, Japan's oil supply commitments were dwindling as a result of majors not renewing supply contracts following expiration to nonaffiliates. In the spring of 1979, Exxon Corp. notified nonaffiliates of its decision: extension by 6 months of supply contracts with the volume to be cut by one half, and termination of supply after the 6-month period. Exxon's subsidiary, Esso Eastern Inc., acquired 49% equity in General Sekiyu also in the spring of 1979. Exxon's notification of suspension of oil supply was followed by similar decisions by British Petroleum Co., Royal Dutch Shell, Caltex Petroleum Co., and Gulf Oil Corp.

To insure supplies, Japan's share of direct purchases and Government-to-Government purchases increased gradually. These purchases accounted for 23.4% of total imports at the end of the first quarter of 1979; increased to 31.8% in the second quarter and to 32.8% in the third quarter; and reached close to 40% at the end of the year. In addition, some refiners resorted to spot deals to procure supplies.

In June 1978, the Government revised the law whereby the Japan Petroleum Development Corporation became the Japan National Oil Corp. and allowed the new entity to stock oil. Under the provisions of the revised law, refiners and trading companies are to stock a 90-day supply of oil by the end of FY 1980, and the Government was to stock 20 million kiloliters (equivalent to a 20-day supply) by the end of FY 1982. Also the Japan National Oil Corp. signed a basic agreement with China in 1979 to explore for oil in the southern and western Bohai Gulf.

In 1979, construction of the petrochemical complex at Bandar Khomeini (Bandar Shahpur) in Iran by the Mitsui group was 85% completed before suspension due to political turmoil. The Japanese agreed to invest money through the Overseas Economic Cooperation Fund (OECF) to aid Mitsui's added construction costs resulting from the suspension. OECF was to assist other projects: A petrochemical complex planned by Sumitomo Chemical in Singapore; a methanol plant planned by Mitsubishi Gas Chemical and C. Itoh in Al Jubail, Saudi Arabia; and a second complex in Al Jubail planned by Mitsubishi concerns.

Uranium.—After the United States, Japan is the world's second largest nuclear energy producer with a total capacity rated at 54,550,000 kilowatts by 72 plants. Lacking indigenous resources, Japanese utilities have contracted for deliveries of 150,000 tons of uranium (yellow cake) by 1990 and 170,000 tons by 1995. The major sources are Rio Tinto Zinc Corp., Ltd., of London; Denison Mines, Ltd., of Canada; GOGEMA, Nufcor of South Africa; and Ranger of Australia.

Overseas Uranium Resources Development Co. (Japan) in collaboration with COGEMA and the Governments of Spain and Niger began uranium production in Akouta, Niger, in August 1978. In 1979, Overseas Uranium found an uranium deposit, estimated to contain 30,000 tons of contained uranium, in Afasto, Niger.

The Mineral Industry of Kenya

By Janice L. W. Jolly[1]

Kenya's mineral industry, and economy in general, experienced a slower performance during 1978 and 1979. Among other problems, the Fluorspar Company of Kenya went into liquidation in 1979, and was taken over by the Government. Inadequate transportation was to have caused spot shortages of cement and salt through much of the period. Although the oil products line to Nairobi became operational in 1978, the cost of imported oil was forming more and more of the nation's import bill while exports were decreasing. Imports, which had been financed mainly by higher tea and coffee revenues during the "boom" conditions of 1977, increased in value by 33% during 1978 while export revenues dropped. A serious balance of payments position resulted and stringent import and credit controls were instituted in late 1978. A 25% import deposit was required for crude petroleum, but by yearend 1979, this requirement was dropped as the foreign exchange situation began to improve slightly. The value of exports declined 5% during the first 9 months of 1979, while imports fell by 16%, thus providing some reduction in the visible trade deficit from the record 1978 level. Inflation, which averaged 15% per year over the 1974-78 period had fallen to 8.1% in the 12 months to November 1979.

Kenya is basically an agricultural country with this sector accounting for over one-third of the nation's gross domestic product (GDP) estimated at $5.7 billion[2] for 1978 and $6.3 billion for 1979. A sharp drop in world prices for coffee and tea was the primary cause for the poor performance shown by the domestic economy and trade accounts. Although Kenya produces a wide variety of mineral products, it has thus far been of small significance to the nation's economy. The manufacturing sector, which in 1978 represented about 16% of the nation's GDP, registered a 14% increase in production and was the fastest growing sector of the economy. However, this was primarily the result of strong domestic demand, since exports of manufactured products, including many metal and petroleum products, were down.

Under the new government formed after President Kenyatta's death in 1978, foreign investors were to continue to enjoy the benefits of the Foreign Investment Protection Act. Foreign investment played a major part in the development of the industrial-sector, accounting for 15% in 1972 and 14% in 1976 of the gross investment. The fourth development plan (1979-83) estimated that about $860 million will be required for industrial-sector investment in the next 5 years. Foreign investment will be particularly encouraged in priority industries, including basic steel and heavy-chemical industries, that require advanced technology and skills. The Government does not intend to participate in financing the development of the majority of new industries; instead, it will identify new investment opportunities, find partners for foreign investors in the country, help local investors with feasibility studies, and provide infrastructure such as roads and services. The target is a 9% per year growth in manufacturing over the plan period.[3] New projects proposed, announced, or completed during 1978 included the expansion of a ceramics plant at a cost of $3 million and a steel-casting plant worth $8 million, both of which involved participation by parastatal organizations. Work on the $5 million extension to the steel-rolling mill at Kikuyu was nearing completion in 1979.

The rapid growth of Kenya's economy in

the last decade had placed tremendous demands on the transport and electrical supply sectors. As a result of plans to expand or improve these services, Kenya has negotiated several loans from the international financial community. Road improvement loans were forthcoming from the World Bank ($90 million), U.S. Agency for International Development ($57 million), Norway ($3.1 million), Britain ($175,000) and Japan ($2 million). Railway improvements were to be financed through loans from West Germany ($7 million), Sweden ($4 million) and Britain. When completed, the Government-owned Kenya Railways will have 125 new diesel locomotives, 3,600 wagons, and 27 passenger coaches. The modernization program also includes improvement of the railway yards and construction of a containerization terminal at Mombasa. Loans were also secured for Kenya's two major electricity projects, the Tana River hydroelectric project, and the Olkaria geothermal project. Contributing to the Tana River hydroelectric station on the Upper Tana River were the West German Government ($41 million), the European Investment Bank ($16 million), the European Development Fund, the United Kingdom, and the Government of Kenya. Three major power stations were already in operation on the Tana River, and there were expected to be at least three more potential hydroelectric sites developed here over the next 15 years. The 1,000-kilometer-long Tana River is Kenya's largest River, and the only substantial source of hydroelectric power generation.

The Kenya Power Company project for exploiting geothermal electrical power at Olkaria was to cost about $66 million and was being financed by the World Bank (9 million), the Commonwealth Development Corporation, and partly by the Government-owned Kenya Power Company itself. It was estimated that geothermal electrical energy will be considerably cheaper than oil-fired systems, but slightly (about 10%) more than the recently commissioned hydro-power stations. Extensive investigations including geological, chemical, and geographical surveys have been made by the United Nations Development Programme (UNDP). The initial project will be capable of generating 15 megawatts of electric power, and will be followed by further drilling for a second 15-megawatt unit. By late 1979, three Japanese companies had received orders for $11 million worth of equipment to be used in the geothermal powerplant, which the West German firm of Brown-Boveri was to build for Kenya Power Company.

A recently concluded airborne exploration program was carried out by Terra Surveys of Ottawa, Canada, and was financed through a loan made available by the Canadian International Development Agency (CIDA). The exploration concentrated on two areas: Area I in southeastern Kenya and Area II in western Kenya. The final results of the survey were made available as open-file reports from the Commissioner of Mines and Geology, Mines and Geological Department in Nairobi, Kenya. Past mineral development in Area I has been confined to the gemstone belt, and a number of industrial minerals that included magnesite, kyanite, graphite and asbestos. In addition, serpentinized ultramafic rocks in the area were considered favorable hosts for chromite. Uranium was considered a potential in the eastern part of Area I where Permian-Triassic Karroo type sediments occur. Mining in the Karroo sediment area has been mostly from barite-lead and lead-silver vein deposits. Other deposits with potential include a large carbonatite complex that is currently under investigation, and a significant disseminated sphalerite deposit that was discovered within sandstone. Area II contains greenstone belts of Archean volcanics and sediments, and includes a sequence of rhyolitic volcanics rocks that are considered favorable hosts for massive sulfide deposits of the volcanogenic type. Past mining in Area II has been confined to gold and copper. The Kenya Mines and Geological Department was doing a followup program that included mapping, geochemistry, and geophysics. Some diamond drilling of priority anomalies was also underway. Three additional agreements relating to agriculture and mining were also signed in 1979 with Canada that would provide Kenya over $10 million for mining development.

PRODUCTION AND TRADE

Much of Kenya's mineral industry remained somewhat static throughout 1978 and 1979, although several commodities showed significant production increases in 1978, such as crude phosphatic fertilizer materials, soda ash, kaolin, and gold. Others showed a decrease including barite, feldspar, diatomite, and fluorite. Although domestic demand was high, cement production remained a problem. Mineral production in 1978, excluding petroleum products, was valued at $95.5 million.

The cost of imported oil more than doubled after the 1978 Iranian crisis, and was forming more and more of the nation's import bill, while the value received for petroleum product exports decreased. For the first three-quarters of 1979, petroleum products formed 19% of the total import value of $1,187 million, and 16% of the total export value of $908 million. In contrast, total exports for 1978 were valued at $1,070 million and total imports at $1,787 million. Crude petroleum products contributed 18% to the total export value for 1978. Kenya relied on Iran for 45% of its petroleum needs in 1978. The major suppliers were Iran, and Saudi Arabia, which accounted for over 60% of the country's crude petroleum requirements. Hard hit by higher oil prices, Kenya was maintaining a 6-month supply.

The Kenyan Government was considering the introduction of an export credit insurance and guarantees scheme to help exporters increase and diversify their trade. If adopted, the scheme would enable exporters to spread the large number of operational risks by serving as collateral when dealing with banks. Despite efforts to narrow the gap between Kenya and Japan, there was still a pronounced imbalance of trade. Exports to Japan in 1978 were valued at $9.5 million, compared with $175.7 million for imports. During the first 6-months of 1978, Japan imported 8,157 tons of fluorite from Kenya, but Japanese iron and steel makers were consuming much less fluorite than in the past owing to modified production methods. Kenya was to sell about $5 million in fluorite to the Soviet Union in 1980 after an agreement between Kenya Fluorspar Co. Ltd. and Soyuspromexport of Moscow. Another consignment of 12,000 tons was exported to West Germany in 1979. Kenya exported about 15,000 tons of soda ash to southeast Asia in late 1979. A similar cargo went to Singapore and neighboring ports in June 1979.

[9]Value only reported at $304.
[10]Value only reported at $581.

COMMODITY REVIEW

METALS

Columbium (Niobium).—Kenya approved the assignment of development rights to Rhone Polenc of France for exploitation of the rare-earth deposit at Mrima Hill, located 80 kilometers southwest of Mombasa. The ore will be treated in France.[4]

Copper and Gold.—A recent survey revealed that economic deposits of gold and copper still exist in the abandoned mines at Macalder in South Nyanza District of Western Kenya. Plans to renew exploitation apparently depend upon the completion of the Karchugogo Falls electric power station.[5]

Iron and Steel.—The United Nations was considering financial assistance for the construction of a mini-steelworks at Mombasa. The plant would produce 300,000 to 400,000 tons per year of various steel products, using imported coal and iron ore from Swaziland. Direct reduction of Swaziland ore with electric arc furnaces and a rolling mill were also under consideration.

The galvanized iron sheet manufacturing company, Mabati Ltd., of Nairobi, was undergoing expansion to enable it to increase capacity from 15,000 tons to 60,000 tons per year. The factory will also manufacture pipes of up to 8 inches in diameter. Roofing-iron sheets produced at the plant were exported to Uganda, Zaire, the Sudan, Rwanda and Burundi.

NONMETALS

Barite.—A new barite mining company, Ewaso Mining Enterprises, entered the market with a product containing 91.4% barium sulfate. Supplied in bags, the ore was crushed into 1/2 inch pebbles. The firm was owned by John Seago and Charles Kerti Ole Sambo of Nairobi, Kenya.

Cement.—Inadequate rail transportation created cement shortages that lasted through most of 1978 and 1979, threatening development projects and the livelihood of many contractors. The situation was partly relieved in late 1978 when additional rail cars were allocated by Kenya Railways to transport cement to outlying areas. With the increase in demand, both cement plants were undertaking expansions, and a third plant was being planned. The Bamburi Portland Cement plant near Mombasa recently raised its production capacity to 1,250,000 tons per year, but the additional capacity was expected to be totally absorbed by 1983. The East African Cement Company plant at Athi River was increasing from 265,000 tons to 450,000 tons per year. The extensions will involve a total investment of more than $4 million, which will be financed by loans from the Danish and Belgian Governments, the European Investment Bank and the Kenya Commercial Bank. The Blue Circle Group was serving as consultant for the improvements. Kenya's current total cement production capacity was estimated at 1.5 million tons per year. Both cement plants operated under a common marketing company, Kenya Cement Marketing Ltd., to deal with cement distribution throughout the country. The price of cement was $76.90 per ton, and $4.10 per 50-kilogram bag in 1979.

Fertilizer Materials.—A large fertilizer plant was to be built in Mombasa as a joint project between the Government and the East African Oil Refinery. Negotiations were underway. The United Nations Food and Agricultural Organization's (FAO) commission on fertilizers recently approved a plan to make fertilizers available to developing countries at prices they can afford. The FAO estimates that 45 most seriously affected (MSA) nations will need to import 2.6 million tons of fertilizers, costing $800 million. The MSA countries, which includes Kenya, still cannot afford to purchase adequate quantities necessary to sustain and increase food production. The gap between fertilizer demand and ability to import has grown steadily. The FAO was calling for greater efforts to increase fertilizer production capacity in these countries. The Netherlands, Norway, and Japan will provide Kenya with 67,600 tons of fertilizer on a grant basis to help Kenya meet its requirements of 172,500 tons for the period 1979-80.[6]

Fluorite.—In August 1979, the Fluorspar Company of Kenya Ltd. was liquidated after being hit by recessions of the world steel industry, transportation problems, and phosphate contamination in some of the ore. The Kenyan Government took over all assets of the company including responsibility for the 1,200 workers, who will be absorbed into a new company to be called the Kenya Fluorspar Company.[7]

Gem Stones.—Large amounts of garnet and ruby were found by the Austrian mining company Austromineral at the end of December 1978 in the Taita-Tateva hills area. The area of gemstone deposits was reported to be 70 kilometers long. A deposit of iron ore (500,000 tons) and graphite (100 million tons) were described from the same area.[8]

Salt.—Kenya experienced a brief shortage of salt in late 1978 when more than 10,000 tons of refined salt was left lying in the Kensalt factory while a dispute carried on between the Kenya National Trading Corporation (KNTC) and the salt manufacturer. KNTC finally agreed to buy salt at the gazetted ex-factory price and to meet the transportation costs to their depots throughout the country. Salt Manufacturers (Kenya) Ltd., a new salt manufacturing company, was expecting to export surplus salt from the more than 100,000 tons of marine salt that the company was to produce near Malindi.

MINERAL FUELS

Petroleum.—The oil products pipeline serving Nairobi became operational in 1978. The 450 kilometer pipeline delivered a variety of fuels from the East African Oil Refineries, Ltd. (EAOR) petroleum refinery at Mombasa to Nairobi. Kenya Oil Pipeline Company (Ltd.) (KPCL) was operating four pumping stations at Changamwe, Maungu, Mtito Andei, and Sultan Hamud. With only two of the four pumping stations operating at Changamwe Mombasa and Mtito Andei, KPCL was able to deliver products to Nairobi at the rate of 240,000 liters per hour, which can be doubled when all four stations are engaged.

EAOR introduced a program to reduce

the percentage of fuel used in operating the refinery in an effort to save foreign currency for petroleum imports. EAOR processed nearly 1.6 million tons of crude oil from January to August 1979, using 4.2% for refinery fuel. In 1978, 4.7% was used for refinery fuel. It was estimated that this represented a saving of $1.3 million in foreign exchange.

On October 26, 1979, the Kenyan Government and a group of three oil companies, consisting of Kenya Cities Service, Marathon Petroleum, and Union Oil Kenya, signed an agreement for oil exploration in an area north of Malindi in the Formosa Bay region. The group was given exclusive rights over 12,428 square kilometers both onshore and offshore. Elf-Somalia was withdrawing from Ras Binah and Kisimayo. The Simba No. 1 test hole was completed in March 1978 with no results. Simba No. 1 was drilled in 3,017 feet by drillship Pelerin for Total Petroleum Ltd. and Elf-Aquitaine.

Kenya began construction of a $60.4 million plant in Kisumu for production of alcohol from molasses. A second, smaller plant costing about $25 million was also planned in western Kenya. Annual output of the Kisumu plant was expected to be 7,390 tons of alcohol. A waste water treatment unit will eventually be part of the plant and will be capable of recovering methane, ammonium sulfate, and gypsum. The Government estimated that foreign exchange savings on oil substitution could reach $700,000 per year. The plant will be commissioned in October 1980.

The Mineral Industry of North Korea

By E. Chin[1]

North Korea's second 7-year plan, in which mining was to be a priority sector, began in 1978. The targets for 1984, which called for doubling and even tripling output in some sectors, were revised in many cases to below the levels originally announced in 1974. While the major objectives in the mining industry remained unchanged, output of coal in 1984 was scaled down from 100 million tons to 70-80 million tons. The annual production targets for steel, nonferrous metals, and cement by 1984 were 8 million tons, 1 million tons, and 13 million tons, respectively.

At the third session of the Sixth Supreme People's Assembly held in late March 1979, the National Budget for 1978 was summarized and the National Budget for 1979 was approved. The 1978 budget was described as being "successfully settled with the enormous amount of 913.7 million won in reserve after spending a large sum of money to insure the accomplishment of the task of economic construction projected in the first year of the new prospective plan...elevating further the people's living standard." Additionally, the 1979 budget was characterized as "accurately organized to actively mobilize national revenue sources in order to insure the successful accomplishments of the People's economic plan of this year, intended for faster economic development..."[2]

Total revenue increased 13.5% to 15.7 billion won in 1978. Total revenue in 1979 was expected to reach 17.3 billion won. In terms of U.S. currency, one won is believed to be equivalent to about 105 cents. About 70% of the reported revenue was from trading and earnings from national and industrial enterprises, while the remainder was from local payments to the Central Budget and growth of savings from reduced material cost.
